## Introduction

There is something fundamentally faulty with the principle that established the prisons everywhere in the world (O'connor 2014) and Nigerian Prison is a place where human rights are systematically violated (Amnesty International 2007). Such violations of human rights are multifarious. All over the world, prison is synonymous with the denial of freedom and certain human rights but there is a sharp difference between the denial of freedom in the prisons management of the developed countries of the north like the United States of America and the developing countries of the south like those of Nigeria and other countries of Sub-Sahara Africa. In Nigeria, this denial of human rights seems to go beyond the constitutional to the extra judicial tortures that strain the humane containment in managing humans, whether offenders or the innocent. Some of them are congestion in the cell, denial of education, absence of cell categorization, poor rations, inability to attend court, among others. Globally, America stands tall as the country with the highest number of correctional facilities such as education in the prison while the same correctional facilities have led to the shutting down of many prisons in Netherlands because offenders are getting rehabilitated, a huge reduction in recidivism. Reports show that about 53,000 inmates are languishing in Nigerian correctional institutions and one out of every five released has a tendency to recidivate (Shajiobi-Ibikunle 2014; Obioha 2011; Ekwunife 2016). In Nigeria, the management of the prisons is in the exclusive list, being the sole affair of the federal government. The penal principles establishing the prisons therefore remain an uncontrollable variable that determine its administration and governance. This in turn results in inequality on the status of the incarcerated (Duguid 2000). In the face of all these, the Nigerian prison inmates face a barrage of assault and denial of rights arising from the wide gap between the inmate as an object and the management as a subject. The entry for this study posits that in the face of punitive measures garnished with a measure of public relations in prisons everywhere, a level of cooperation can be achieved between the pen keepers and the offenders through the practice of sound governance. This agrees with the updated European Prison Rules and a new rule- Rule 50 which allows the prison inmates to discuss matters relating to the general conditions of imprisonment and having same communicated to the prisons management as a way of participating in co-governance for sound governance. In countries such as Belgium, Denmark, Finland, Spain, Germany, Netherlands, and Sweden, there is legislative provision for prisoner participation in the general management of prisons. In eastern European countries, there is the introduction of prisoner councils in view of participatory governance; an air of public relations introduced into penal governance.

## Origins

It would be very erroneous to suppose that imprisonment in Nigeria started with the colonial masters. Okoro (2008) highlights the different forms of prison in Nigeria and this throws more light into the nature of imprisonment in pre-colonial Nigeria. Gunn and Conant (1960) notes that in the precolonial Nassarawa in north-central Nigeria, thieves were kept or confined in their compounds pending when their relations redeemed them. Okoro (2008) examines this under what he called "house custody," a form of imprisonment. In the northern Nigeria, an offender was kept in stocks in a place visible enough in his compound for passers-by to see and jeer at him (Shajiobi-Ibikunle 2014).

Among the Igbos of the south-east, chains were used to confine a murderer while investigations commenced by a diviner to find out the factors that made him commit such a heinous crime. Among the Yorubas of the south-west, debtors were said to be confined in a place called

*tubi* and virtually every chief had his *tubi* which was a word equivalent to prison. For every one of these confinements, an act of disobedience or social disorder was an antecedent. The Ogboni Cult in Yoruba land also kept offenders in their prisons for offences such as witchcraft, murder, notorious burglary (Oyeneleye 2007). Bradbury (1957) notes that the *ewedo* was a form of prison where culprits were kept in the Edo tribe of mid-western Nigeria pending when they were sold into slavery or regained their freedom. Among the Tivs of the middle belt region, one who offended had to agree to a term of imprisonment as a way of admitting his guilt. Abubakar (2008) elucidates that in the northern Islamic tribe, imprisonment was not the restriction or confinement of a person in a small dark room but in the house or a mosque. Speaking on the penal system in Nigeria, Shajiobi-Ibikunle (2014) avers that an ancient prison existed in Sokoto where criminals were kept in a building "crowded to over flowing" with prisoners and in the center of it was a dungeon in which the worst criminals were kept. Lord Lugard also recorded that he met prisons in Kano when he captured the city in 1900.

## Nigerian Prisons and Governance

In relation to the attainment of goal 10 of the SDGs, the inequality which incarceration breeds serves as a breach, rather than aiding the attainment of inequality reduction. It serves as a catalyst that ferments a wide gap between the prison inmate and the society at large. This is the fulcrum of the poor image and stigmatization surrounding the prison institution in Nigeria. In an era where sound governance in the light of Public Relations (PR) strategies aims at using carefully and purposefully orchestrated communication to bridge the wide gap between prisoners and the free persons, Farazmand (2017) argues that this approach in administration goes far beyond good governance to sound governance, maintaining that to govern effectively; citizens must be involved as active parts of innovation in policy and capacity building for governance and public administration. The entry addressed here is sound governance through public relations in Nigerian prison. Therefore, the administration in Nigerian prison is of paramount importance since it can make or mar governance. Besides, the constitution establishing the administration of Nigerian prisons is antithetical to the practice of public relations within the penal system (Ekwunife 2016).

## PR, Sound Governance, and NPS

Applying PR for sound governance (SG), Dyer (2003, 79) explains that the type and quality of information is essential for individual to make informed choice of significance. Hence, "public relations officers in governments, businesses, community organization, and lobby groups of all kinds engage in information management to sway public opinion and direct choice." Talking about information management in the light of PR for sound governance, attention has been drawn to the application of a form of communication that creates a docile citizenship that is uncritical and accepts opinions or actions as they are (Dyer 2003; Ahiante 2008; Lattimore et al. 2009). This kind of information management seems to gain ground in prisoner management as the enquiry capacity of prison inmates is reduced through a haze of regimenting rules that deters them from democratically participating in their own societies.

In line with the SDGs goal of reduction of inequality, Khan and Musarrat (2016) note that sound governance is joined up governance which is not so emphatic of top-down policy making but also concentrates on the horizontal whole of governmental policy. Avery and Graham (2013, p. 274) note that governments at all levels have maximally made use of social media in order to be "more transparent, participatory and collaborative with their citizenry" Bertot et al. (2010) amplify same thought, observing that the idea of transparency, participation, and collaboration with the citizenry is a form of political public relations for sound governance. These scholars

explain that the popularity of social media has brought a change into the practice of public relations which has made public information officers to adjust their communication strategies.

To this effect, information management as PR strategy for sound governance in Nigeria prisons is an issue considering the fact that there is something fundamentally faulty with the criminal justice that established the prisons everywhere in the world (O'connor 2014). This fundamental faultiness has damning implications on the overall administration of the prisons, with particular regard to information management. Explaining the governance that revolves around the prisons, Slack (2016) highlights the forms of punishment in both nineteenth century and modern prisons to include Deadline, Just desert, Lock-step, and stocks. Each of these punitive measures has a serious physical and emotional effect on the prisoner and fundamentally strains the idea of public relations in prison governance. Going by the Pennsylvania model, an inmate serving in isolation of other inmates has a greater chance of being rehabilitated; hence, Senge (1990) argues that people who are kept in the same enclosure behave similarly. "The purpose of segregation was both to punish and to rehabilitate. . .... No man could speak unless specifically asked to. . . socialize, or work with other inmates" (Slack 2016, p. 1).

All these are in tandem with the principle of penal governance but certainly do not align with the ideals of good public relations for sound governance. Emphasizing the importance of public relations for sound governance, Newsom and Scott (1985) maintain that even in military government where force and regimentation were the underlying principles, the early military Roman Empire was aware of the importance of public opinion in which opinion research was carried out constantly. The essence of this opinion research was a kind of public relations research aimed at knowing the disposition of the ruled in view of participatory, collaborative, and transparent government. The functional and dysfunctional roles of public relations in governance are indubitable that Newsom et al. (1985) note that Pope Urban II in 1905 used public relations to promote a war upon his Muslim neighbors to the East while in 1215, Stephan Langton, the Archbishop of Canterbury, used public relations tactics to lobby for a political cause. Niccolo Machiavelli applied his public relations strategies to give legitimacy and credibility to a political party in power.

## Sound Governance and Penal Policies

The possibility of participatory governance in the prisons, that is, governance that is inclusive of prison inmates in the face of penal policies, is still an argument. The reflection of humane governance in the discharge of penal action has been questioned by Jahan (2016), noting that the inclusiveness of persons with a view to projecting sound governance is striking. In this case, the persons whose participation is under discussion are the prison inmates who are the direct recipients of penal actions. It should be noted that the "get tough on crime" policy of the criminal justice system is the metaphor guiding the overall administration of the prisons. This has had an increasing influence on the penal measures and has also not brought a reduction on the recidivism level. The outcome has been a rapid growth of correctional system that is void of humane containment (Andrew and Bonta 2010). It is worthy to note that in the aberration of Shabbir (2002), during the early era of Islamic administration of justice in Arabia, the handling of Awaiting Trial Persons by the detainer and the prophet's instruction for feeding the detained upheld the ideals of human dignity and respect unlike what we have in the today's prisons.

In the face of this, the realization of sound governance in a penal system like the Nigerian Prisons Service poses a challenge since the public relations angle remains doubtful. In many parts of the world, it is understood that the Risk-Need-Responsibility (RNR) model which actually examines criminogenic factors and the cognitive social learning has had a more functional waning impact on criminality and recidivism. On the contrary, the "get tough on crime" policy does not treat criminality with kid gloves or human face. It

is highly retributive as corporal punishment, imprisonment, probation, and so on are inflicted on the confined. The criminal justice system or the penal system remains a burden and a part of crime-ridden society, exacerbating the problems rather than being curative. Hence, prisons as an institution harms more than it heals (Scurrah 2008), leading offenders into a state of extreme radicalization.

In view of sound governance with due application of public relations, the criminal justice system is expected to oblige itself with the inmates' accessibility to justice, good prison conditions, fair trial evidenced by the absence of unnecessary delays in judicial proceedings, among others. If access to justice is not fundamental and cannot be guaranteed, then sound governance is strained. In Nigeria, the application of sound governance in prison management will lead to a review of such laws as: no punishment except in accordance with the law, the accused is innocent until proven otherwise by a court of competent jurisdiction, etc. It raises the issue of how much of these laws are theoretical and practical when the mere accused (Awaiting Trial Men) in Nigeria prisons are tortured and tormented extra-judicially, the minor offenders and the hardened criminals are kept in the same cell with no cell classification and crime categorization, the inmates are denied basic rights such as food rations and ventilated cells, among others (Obioha 2011).

In the recent times, the idea of sound governance in prison management could be linked to such terms as correctional administration which aims at reducing the haze of brutish rules that make prison management very hellish while engaging the offenders in rehabilitative programs and restorative justice that successfully integrate the released inmate into the larger society. A perspective that is of crucial concern to this study is citizen's participation in penal governance. Citizens here refer to both the prison inmate (during and after incarceration) and the larger society to whom the ex-offender must be reintegrated for a successful, functional, and productive postrelease life. Emphatically, how much of citizens' participation is evidenced in prisons governance?

## Sound Governance and Ex-Offenders' Rehabilitation

The release of an ex-offender is still an infinitesimal aspect of his productive return to his society if there is no empowerment for his successful re-absorption (Ekwunife 2016). The returnee-inmate needs empowerment, and in view of citizen participation in governance (that is, co-production), the local communities of the previous offender need to be empowered in order to empower (absorb) the returnee. These are aspects of welfare and re-integration programs which the penal system is supposed to consider in the light of sound governance and public relations. The imbalance across local communities, states, and regions must be discovered so as to be specific about the empowerment (Christopoulos et al. 2012). To enhance sound governance that ensures citizens' participation in co-production, the prisons as a rehabilitative institution is obliged to investigate the variables such as the cultures of the larger society that impede the successful reintegration of the ex-offender. Reasonably, there has to be a nexus of relationship between the penal institution and local communities, with serious orientations so that the return of the ex-offender is not perceived by the community as a threat. The wide gap (inequality) that exists between the inmates during incarceration and thereafter, and his immediate society must be bridged with this collaboration.

## Sound Governance and Community's Involvement in Penal Policy

A wide view sees co-governance as democratic mechanisms aimed at involving the citizens in the making of public policy. It constructs a bridge between public institution and ordinary citizens with a view to heightening the efficacy and responsiveness of public policy making programs (Palumbo 2017). This is governance that is integrative of the citizens by deliberately giving power to people which co-opts them in decision making and policy formulation, all to ensure that the citizens' interests are represented and promoted.

## Conclusion: Public Relations and Sound Governance

To all intents and purposes, penal policies are punishment-driven. It may seem impossible to earn the support of the internal citizens of the penal system (prisoners) towards advancing prisoner's management. However, this notion of citizen's integration in sound penal governance is predicated on the ideals of public relations which Awake (2000) observes that with this, even the sick at the throes of death can face death with confidence. Also in view of penal governance garnished with public relations, an air of citizen-centered governance, otherwise called sound governance can be achieved. This will go at length to reduce the inequality between the prisoner as an object and others as subjects, hence, advancing sound governance within penal administration.

In Abakaliki Federal Prisons of Ebonyi State in Nigeria for example, and just as in other Nigerian prisons, prison inmates are assigned certain portfolios and powers in view of co-governance. Each cell has a set of hierarchical leadership which the inmates obey as a matter of regimentation. There is also an IG (Inspector General) who is the highest ranked leader among the inmates. Maintenance of law and order among the inmates is ensured by the authority of each cell while cases beyond the handling or authority of a particular cell authority are managed by the Inspector General. Cases above the Inspector General are invariably transferred to the prison authority, (Field Work 2017). The involvement of these inmates in the penal administration agrees with the co-production, citizens-engagement, and the PR treat that informed the sound governance which this study but the adoption of the inmates' decision in penal governance remains problematic. Palumbo (2017) and Franck (1992) explain that there is a sustained argument that the main aim of democratic governance or citizen engagement is to earn and increase legitimacy of public policies by consulting the common man, and not necessarily to empower them to actually be a part of the decision-making processes. By implication, citizens engagement stresses citizen's participation for support and collaboration to the already existing policy structure. In the light of this study, this sounds logical in the application of public relations in penal governance as citizens engagement in prison management steps down the rate of recidivism and advances goal 10 of the SDGs- reduction of inequality.

## Definition

| | |
|---|---|
| Sound Governance | This refers to a more comprehensive governance that includes the normative as well as technical and rational features of good governance and presents a balanced view of governance that is less biased and takes into consideration the genuine features of indigenous governance systems that may be at odd or conflict with the globally dominant neo-colonialist power structures. It has all the quality characteristics of governance that is superior to good governance and is sound technically, professionally, |

| | |
|---|---|
| | organizationally, managerially, politically, democratically, and economically. Sound governance is also sound in terms of capacity and anticipatory behavior; it is democratic in character, responsive, and competent; and its cultural values are embedded in the societal values and structures (Farazmand 2017). |
| Inclusive Education | This refers to inclusive and equitable quality basic education for inmates' behavior modification and proper absorption into the society when released and also promotes lifelong learning opportunities for prison inmates' post release life. |
| Public Relations | A deliberate attempt to use education as a sound governance strategy to maintain a mutual and beneficial relationship between the prisons and its publics toward the successful reabsorption of the ex-offender. |
| Education for Reintegration | A special kind of learning aimed at meaningful or productive absorption of the ex-offender into the larger society after incarceration. |

## Introduction

According to Farazmand (2017), sound governance (SG) is a governance that is superior to good governance and is sound technically, professionally, organizationally, managerially, politically, democratically, and economically. Ekwunife (2016) observes that the rationale behind inclusive education (IE) in Nigeria prison yard to a great and alarming extent remains a picture in phantasmagoria. This is traceable to the "get tough on crime" policy of the penal system which makes the haze of punitive measures much weightier than any psychotherapeutic approach utilized in managing the incarcerated. It also follows that Nigeria Correctional Service (NCS) has not fashioned out implementable programs that take care of the postrelease life of the incarcerated. While education in the light of public relations (PR) emphasizes more of reinforcement and less of punishment, prisons fundamentally upholds penal principles which are the last resort as a strategy used by PR in managing conflicts. It is antireformatory that majority of the prisons in Nigeria have no cell classification and offence categorization (Agomoh 2008; Obioha 2011; Shajiobi-Ibikunle 2014; Onimajesin 2006). This spells doom for behavior modification and defies SG.

Anyanwu (2002, 89) recounting her ordeals in Kirikiri Maximum Prison, Lagos writes that "Once in the prison yard, no distinctions are made. Innocent or guilty, all face the same conditions. Hardened criminal or first timer. . . prisoners of crime and prisoners of conscience, teenager or geriatric . . . those who know teach those who do not know." This is the true picture of prison management in Nigeria. Again, the policy of excluding the Awaiting Trial Persons (ATPs) from the prison education program alienates them from the society and negates the inclusive and democratic nature of SG and education as a right for all.

In view of this, the institutional framework for the attainment of IE and reintegration of ex-offenders in NCS as contained in goal four of the 2030s global agenda of sustainable development goals (SDGs) adopted in 2015 remains very challenging. This is because inclusive and equitable quality education that promotes lifelong learning opportunities for all requires institutional global commitment by all in the policy-making framework of the government (Bexell and Jönsson 2017). In relation to meeting up with global best practices, Nigeria Prisons Service (NPS) in the year 2019 metamorphosed into NCS and Farazmand (2017, 10) explains this metamorphosis when he observes that governance reforms have evolved and inspired governments throughout history to give attention to policy reforms. In his approach, "sound governance denotes a system of governance that is not only domestically sound, but is also sound internationally or globally in its interaction with other nation-states and their governments on an independent and self-determining fashion." According to Omede (2016), policy frameworks

on IE in Nigeria ranges from the 1977 National Policy on Education; Convention on the Rights of the Child (CRC) 1989; Child's Rights Act, Laws of the Federation 2004; the Universal Basic Education (UBE) Act 2004; and the National Policy on Education (2008).

Ekwunife et al. (2020) note that in the developing countries of the south like Nigeria and other countries in sub-Sahara Africa, prison management has not yielded the expected outcome in terms of rehabilitation and reintegration as human rights are systematically violated while O'Connor (2014) observes that the objectives of the prison as an institution for character reformation have not been met globally. Rather, the prison at a global level has achieved more of the incapacitation of the prison inmate. Olusina (2012), Obioha (2011), Shajiobi-Ibikunle (2014), O'Connor (2014), and Ekwunife (2016) explain that the high rate of recidivism both in African and European prisons is an indication that there is something fundamentally wrong with the penal code everywhere in the world. This form of governance is also in sharp contrast with the idea of SG as Farazmand (2017) posits, and it contradicts the principles of PR strategies for the enthronement of SG as advocated by Ekwunife et al. (2020). Scurrah (2008) corroborates this view, noting that the penal principles dispose the prisons to damage more than they heal. In line with this, it is necessary to explain the use of the following terms in this study: NPS and NCS are not used interchangeably. While NPS is used here to refer to the old order, NCS is used here as a name to refer to the new system advocating reforms in prison governance. Prison Special School Abakaliki (PSS Ai) is a product of NPS while Correctional Service Special School Abakaliki (CSSS Ai) belongs to the new order – NCS.

Aside using punitive measures for deterrence and rehabilitation, which to a reasonable extent have not advanced the cardinal objectives of NCS, other correctional strategies have been employed by NPS in the spirit of the purported correctional Administration. This new correctional administration is SG and PR related in theory. Ekwunife (2016) identifies the Prison Special School (so named then) Abakaliki as one of the correctional strategies aimed at keeping fate with the Safe custody, Reformation, Rehabilitation, and Reintegration (SRRR) objectives of NCS. This aims at creating a paradigm shift where incarceration is not equal to condemnation. Azuewah (2009) maintains that the introduction of the then PSS Ai, according to the founder, Chief Austin Igwe Edeze is in the spirit of IE which brings formal learning to the cell posts of prison inmates who are completely shut out from formal education; a practice that is in contrast with what prisons stands for in Nigeria. Farazmand (2017, 8) maintains that SG is a phenomenon with superior qualities in function and "is therefore inclusive and promotes participation and interaction in an increasingly complex, diverse, and dynamic national and international environment". Explaining the superior qualities and functions of SG, Erny (2013) writes concerning the resultant effect of such literacy education among the incarcerated, "...literacy education programmes within incarceration facilities have positive implications on rehabilitation and post release life as well as decrease the recidivism rates of the inmates... likely have a positive impact on the reentry into society by adult learners in custody within incarceration facilities."

Lending credence to same thought above, Batcheeder and Pippert (2002), Scurrah (2008), Braggins and Talbot (2003), and Coley and Barton (2006) pinpoint that formal education among the incarcerated is a strong force toward their rehabilitation, and more importantly, has positive outcomes for the society at large. The National Board of Employment Education and Training (1992) and Scurrah (2008) also observe that allowing prison inmate's access to formal education enhances their successful return and absorption by the society and reduces recidivism while at the same time, cuts down on the social and economic costs of criminality to the society. The importance of formal education in realizing the SRRR objectives of NCS, and objectives of

prisons at a global level, therefore, cannot be undermined.

SG in all corrections, with Nigeria in particular, is meant to be inclusive. The inclusion of the excluded in NCS should be geared toward rehabilitation and correctional administration but this is completely at variance with the penal law system which stipulates imprisonment with hard labor. The penal code does not promote inclusion and has not helped the learning process, rehabilitation, and reintegration of ex-offenders into the society. To advance the management of corrections in view of SG and PR, the "transformational justice act" of the State of Oklahoma, USA, has evolved a system to prevent the inmates from returning to crime upon release.

SG in view of corrections' management is such that cares about the prisoners' welfare. To the prisons authority therefore, IE is a job of managing the society's neglect and the molding of the fall–out from the society's neglect. Emphasizing the "soundness" characteristics of SG as a phenomenon with superior quality, the prison management through the curriculum of the CSSS Ai must ensure that the return of the inmate to the society does not pose danger or increase criminality, as enormous as this task may seem. Lack of attention to inmates, lack of food, water, clothing, and other poor attention that strain good PR for prisoners are all trends which the prison welfare management unit must rise up to as insensitivity to these has resulted in violence/protests, and jail break has become a matter of regular occurrence. This also endangers the return of the inmate to the larger society, making it most dysfunctional. IE in the light of SG and humane containment or effective PR empowers the previous offender and the community of absorption for productive post incarceration life (Farazmand 2017; Ekwunife et al. 2020).

Using the CSSS Abakakili as a case study, the entry for this study posits that the effectiveness of IE policy in a unique setting where the idea of formal education seems very contradictory would not yield optimum result, hence the dire need for SG and PR in the overall management of corrections. SG in the context of this entry agrees with the position of Farazmand as a kind of governance approach that adopts organized formal education to realize the cardinal objectives of NCS – safe custody, reformation, rehabilitation, and reintegration, and also aid ex-offender's postincarceration life.

Azuewah (2009, 2) quoting Edeze, the founder of the PSS Abakaliki elucidates this entry when she observed that "in all the states in the country (Nigeria), there is no one that has a prison school. So the Nigerian concept of prison school is like a contradiction of what prison is all about."

By implication, this supposes that the principles of the penal code that founded the NCS are not in tandem with the principles of formal or inclusive learning in SG perspective. A recent research (Ekwunife 2017) observes that the establishment of the first school in Nigeria prison in 2006 is seen by NPS as a threat, something that interferes with her security mindedness. Supporting this view, Tomasic and Dobinson (1979) pinpoint the prison as a special setting where a multiplicity of subcultures are prevalent which invariably make rehabilitation a mirage. The rehabilitation of the inmate is inextricably linked to learning which is a permanent change in behavior. This learning represented by IE is thus impeded by prison setting with its penal principles. Describing this special setting, Heilpern (1998, 77) says it pointblank that "Prisons are, above all else, a closed environment, with a pecking orders on brute force, gang power and fear. They have their own economy, hierarchy, discipline and even their own language."

Supporting the view of Tomasic and Dobinson above, Scurrah (2008, 3) adds that "achieving positive personal change and development within this environment is problematic." Why? Senge (1990) explains empirically that persons who are kept in the same environment and system have a very high tendency to behave alike, producing similar results.

Still looking at the contradiction which the presence of the CSSS Ai poses to the NCS as a phenomenon antithetical to the penal system, this study reviews the policy of NCS which stipulates that the

prevalent formal education in the light of the purported correctional administration is the exclusive preserve of the convicted men (CM) and not the right of the ATPs. In a penal system where there are no cell classification according to age, category of offence, etc., this study passionately and critically questions the supposition that access to formal education is the sole preserve of the CM in as much as the ATPs are confined within the same system, facing the same denial of social and human rights, receiving the same or worse torture and may be exhibiting the same criminal characteristics. The position of SG is a forte in addressing this institutional malaise for an IE that is really participatory. This is in line with Farazmand (2017) which presents SG as governing with the interaction of all elements or stake-holders.

In a field work (Ekwunife 2017) in Abakaliki Prison, a top prison officer explains that the rationale behind the prison education as the exclusive preserve of the CM is that it is the CM that can be rehabilitated, and not the ATPs whose cases have not been decided. Considering the characteristic relationship between the CM and the ATPs in relation to confinement and behavior modification, this study puts up a case against the exclusion of the ATPs in the IE which the CSSS Abakaliki represents. Making a case for the ATPs, Harding (2000) avers that any prison that disables prison inmates from participating in activities such as education-vocational or theoretical cannot be effective in reducing the rate of recidivism and causing deterrence. This is not inclusive governance, hence, not SG.

In any case, Douglas (2001) explains that in spite of the prisoners' acclaimed rights to learning by different organizations in Australia, access to formal education is still treated as a privilege, and not as a right. Okoro (2008) advances same thought when he writes unequivocally that one in prisons custody should know that he has no right to certain things such as freedom to education which is the preserve of a free man. This does not agree with the tenets of SG as Farazmand strongly argues that SG is inclusive, operates both vertically and horizontally. This vertical and horizontal angle of SG is also strongly entrenched in the tenets of good PR which ensures a strong two-way communication with an inherent feedback mechanism (Aliede 2011).

## Origins

"Correctional Service Special School Abakaliki (CSSS Ai) was established in 2006 by the then Chairman of the Ebonyi State Universal Basic Education, Chief Austin Igwe Edeze under the governorship of Dr. Sam Ominyi Egwu" (Ekwunife 2016, 3). Undoubtedly, this was in the spirit of Education For All (EFA) in line with UNESCO's policy. Azuewah (2009) explains that the PSS Ai was to acquaint prison inmates with basic education for behavior modification and proper absorption into the society when released. In the idea of Ekwunife (2016, 3), this is a complete adult education that has an organized learning system from lower basic to upper basic education, sponsored by the government, nongovernmental organizations, and private individuals but the students cannot close their eyes to their immediate challenge-lack of freedom.

The special students being charged with several offences such as murder, stealing, robbery, armed robbery, arson, burglary, kidnapping, rape, among others, are engrossed in the thought of incarceration, and hence, lack the intrinsic motivations to participate in the learning process. The above scholar explains that due to the loss of freedom and its attending headache coupled with penal treatments that strain the concept of SG, the interest to participate in the learning process, is almost, all the time, dependent on extrinsic motivations evidenced by "public relations strategies such as diplomacy, gift presentations, dialogue, appeal, persuasion, mediation, counseling, much of reinforcement and less of punishment." Hence, Ekwunife et al. (2020) advocate for SG and effective PR in the management of offenders.

Since the inception of CSSS Ai in 2006, both the ATPs and the CM enjoyed the learning process

which was completely aimed at institutional correction, that is, reducing the concentration placed on "get tough on crime" policy and retributive justice as a method of rehabilitating offenders to something more functional in healing offenders since the former has caused more damage than it healed (Scurrah 2008). This less of emphasis on "get tough on crime" policy is supposedly the outlook in the new correctional administration which has necessitated NPS to change its name to NCS. This idea of NCS is meant to project the concepts of SG and PR in managing offenders but the underlying principles establishing prisons remain a cog in the wheel of achieving SG in corrections.

Over the years, 98% of the students' population was dominated by the ATPs who actually took advantage of the correctional education program, writing exams such as the First School Leaving Certificate, Junior Secondary School Certificate, and National Education Council Examination. The CSSS Ai has turned out about 350 students.

Recently, a field work (Ekwunife 2017) gathered that following inmates' unrest in which lives were lost, property destroyed and prison gate pulled down in an escape attempt as a result of poor prison governance and management as alleged by the inmates, the ATPs were banned from participating in the school program on the explanation that it is not their right to access such corrective education program. This development has left the school at a still point, in shambles, desolate and, comatose since the CM whom it was claimed to be their right are insignificantly very few, and at worst, have not the minutest interest to attend classes because their date of release has been fixed and it is known to them (Ekwunife 2016). This exclusion has far-reaching implications on SG and IE as it negates the idea of citizen participation and education for all, hence, exclusion in inclusiveness.

In view of SG, IE should gear toward performance; a result-oriented performance that is multifunctional, superior, and quality. Writing on the management and performance, Farazmand (2017) notes that SG is not just about performance but result. It must produce the expected outcome that translates into institutional and system legitimacy. In this thought, Eze (2009), in an address to mark the opening of a 5-day workshop organized for the pioneer teachers of PSS Ai, notes that the special school would further facilitate the realization of the concept of the then, on-going "Rebranding Nigeria Project," championed by the Late Minister of Information and National Orientation, Professor Dora Akunyili, and to complement the re-molding of the lives of the prison inmates in Abakaliki Prison – the ATPs and the CM. This is a governance approach that offers equal and even opportunity for all to lead a meaningful and productive life. Hence, the corrective education program is a fulcrum to realizing the SRRR objectives of the NCS. When this is lacking, it becomes very challenging to sound governance, equity, and fairness since the air of PR required to manage the learning process is not encouraged by the environment of learning. Speaking about the specialness and the concept of PSS Ai on inception at a workshop, Nweze (2008) says, "From the nature of the school, they cannot enjoy school sports competitions, they cannot pay any levies at all, they cannot join in interschool debates, quiz competitions. They cannot even get their uniforms, pieces of chalk, books and biro. That is why it is aptly addressed as a 'special school.'"

From the above viewpoint, the CSSS Ai seems like a special school inside special schools since the special learners are legally denied access to full participation in the learning process, even when majority of them are physically and mentally fit. Ogbuzuru (2008) explains that the concept of the PSS Ai is the collective will of the Ebonyi State Government and the State Universal Basic Education to give equal basic education opportunity for the prison inmates who are participants in the corrective program so that they can reintegrate and contribute meaningfully to the development of the society upon release. This is SG oriented and should empower offenders in co-production on release so that their reentry into the larger world does not become a threat.

In line with SG and effective PR, Cramer et al. (2014) align thought with the above while writing on "Establishing Equitable, Diverse and Interdependent Communities of Learners." They maintain that the inclusive ideology should provide the framework and build equitable relationships among learners within classroom settings. The environment of instruction must be culturally responsive (Gay 2010) as students provide support for each other in order to have an ideal community of learners. Farazmand (2017, 10) stresses this responsiveness when he observes that SG breeds healthy and dynamic values such as the normative values of fairness, equity, integrity, representation, responsiveness, responsibility, tolerance, and equity before law for all citizens. These form the glue for SG system which keeps other dimensions together in a solid way. To this end, "Students must be accountable for the progress and success of each other as a team with no room for exclusion of those who are not perceived as "fitting in" or "measuring up"" (Cramer et al. 2014, 471). It is expected that this supportive relationship shared as members of a community in the class has a positive impact on academic achievement and behaviors that are pro-social, bearing in mind that support provided by peers promotes academic participation, creates extrinsic motivation and helps place school as a priority in the minds of the participants (Wentzel et al. 2004; Crosnoe et al. 2003).

Cramer et al. (2014, 411) write that "once all members of the class are viewed through a lens of respect and equal rights, the types of interactions that occur between teachers and students would be able to change . . . a decrease in teaching students in contrived situations such as segregated resource rooms that teach concepts in isolations. . ." In this inclusive relationship, instruction is tailored to be compatible with students who have various skills and learning styles to the classroom environment. The curriculum must be inclusively designed to include materials that enable learner to be "anti-racist, anti-classist, anti-poverty, and catalysts for positive social change so as to provide the support needed for the academic wellbeing of the entire community of learners". Students have a higher likelihood of dropping out of the school system when they have no sense of belonging to the general culture of the school system (Bost 2006). Learning must be participatory in every sense of the word, like in a mainstream class.

## SG and IE in Global Perspectives

A highlight of some prison education programs from around the world would reveal prisoners' education as a veritable means of social control, both in the developing nations and in the developed liberal societies of the world. The monthly book club which was begun in a medium security prison in Kingston, Ontario, Canada in 2009 has been a welcomed development to the degree that the educational program which started with just a book club now has 27 books which run clubs that run in seven Canadian provinces, using the English and French media of communication. A prison inmate participant notes, "I used to get high on drugs, now I get high on books." No doubt, an idle man's heart is the devil's workshop. With such an enthusiastic and high level of participation in the learning process among prisoners, inmates are kept busy with useful thoughts, then, truncating the chances of criminality in them, both within confinement and post-release life. Ideally, this is SG in prison management that empowers the offender for a productive post release life – Reintegration. The women's monthly book club narrates her experience that when they get into a women's corrections, they are always asked to continue the book club during the summer, because it helps the inmates to ward off boredom as they do not get visitors and are cut off from their families and cultures. Being locked up in a justice system makes these women sick, both mentally and physically.

In Australia, just as in the United Kingdom, prisoners were not allowed access to the Internet.

The need for inclusive learning and giving the inmates a sense of value and belonging has propelled the University of South Queensland to initiate the "making the connection" project which enables prisoners to undertake digital technologies that entail the bringing in of internet into the prisons. This now runs in 16 Australian prisons. This program now replaces the hard-copy system, alienates learners who are already predisposed (Australian National Training Authority 2001). Report notes that the University of Queensland went paperless in 2015 but continues to allow about 450 incarcerated students to access paper-based distant-learning courses with the vision that such disadvantaged sect of the society, in the future can access education via a restricted and secured internet. This can also be described as SG to represent the interest of the incapacitated with the tool of IE. The secure notebook computers which prison inmates are beginning to use to complete their course works in their cells are tremendous innovations in this regard. By implication, the need for prisoner education has broken new grounds in computer technology and made IE more feasible.

In Kenya, Uganda, and other African countries, the Africa Prisons Project (APP) is committed to changing the way criminal justice cases are addressed. SG is poised to changing conventions so that the idea of "good" can be replaced with the idea of "sound," hence SG. This entails tackling injustices in police and court systems as well as within the prison yard. This has been made possible through the teaching of functional literacy and numeracy to inmates who had no formal education before incarceration, and also the introduction of prison libraries. Farazmand (2017) captures this when he argues that SG performs superior functions, not just the statusquo. In the education policy and theory, this is equivalent to what the CSSS Ai was to achieve on establishment among prison inmates in Abakaliki prison (Ekwunife 2016; Ogbuzuru 2008; Eze 2009), but the penal policy places many restrictions. The APP "controls libraries"; one of the newly established libraries at Lang'ata Women's prison in Nairobi serves both prison staff and their families as well as 600 female prison inmates and their children. This is a special educational project in that it provides a legal aid clinic where women can seek professional advice on their cases. Suffice it to say that educational or any program that provides a platform for the incarcerated to seek justice is highest leverage for the prisoners. The APP believes education empowers people to know their rights within the prison, and disposes them for positive change when they reintegrate into the larger society.

The Indian Vision Foundation, founded in 1994 by the Indian first female police officer – Dr. Kiran Bedi, operates in four prisons, building skills and education level among the inmates and family members. This education is both academic and vocational. Hair dressing, weaving and chocolate making courses are projects aimed at concretizing the post release life of the incarcerated. As in many prisons around the globe, female prisoners in India are permitted to keep their children up till the age of 6. Such children are not shut out from educational programs within confinement, thus makes the confinement of the mother, not necessarily the confinement and abuse of the rights of the child who is not even an accused, let alone an Awaiting Trial Person or a convict. Sociologically therefore, supporting incarcerated individuals with educational program of any kind that is inclusive is a key to making prisons anywhere in the world, to become centers of positive transformation.

In all ranks and file, while America is rated quite high in having incarcerated individuals all over the world (O'Connor 2014), it still leads in opening education access for both prisoners and released prisoners. The Obama administration added a feather to this by expanding access to Pell Grants for offenders to access college education. SG should therefore remove any impediment that stops citizens from being part of the system. One of such programs is the Petey Greene program which since 2007 has received and trained undergraduate students to tutor in education programs in corrections

with a view to reducing the rate of return to the prison and allowing ex-offenders to successfully get absorbed into the society and make productive contributions to their families and communities.

Correctional educational program has gained much ground in the USA. It also enables a healthy mix-up and interaction between the outside world and prisoners since the student tutors do not only teach the incarcerated but also receive lesson in "cultural humility" before entering the prison so as to acquire the nitty-gritty, the cool-headedness, tolerance, and adaptability to manage this dejected sect of the society with all-inclusiveness. While the students do not officially learn together in the USA as in Poland or in multiple projects across the United Kingdom, this foundation is successful in facilitating a collaborative approach to teaching in the States.

Prisons with the underlying tenets, perhaps is not the ideal place for formal education but the embrace of SG in the place of the old order is taking universities to partner with prisons all over the world. Poland is not left out where the regional prison and John Paul II Catholic University have synergized in this capacity since 2013. Here, Prison inmates are accorded the opportunity to undertake full-degree courses during their sentences. It is necessary to note that this learning is highly aimed at reforming the offenders and at the same time use them to sanitize the society of criminality. This is the superior function characteristic of SG. Hence, they seriously understudy a course like social work, specializing in "street working" with a view to working with marginalized groups such as drug addicts, the homeless and prostitutes.

The attempt to the all-inclusive nature of the Polish correctional education is worthy of note in this paper considering the fact that after the first year of learning in the prison, prisoners-participant with license – conditions permit are allowed to integrate with the University Campus and take part in seminars and lectures, enabling a sense of togetherness and integration which do not allow one to differentiate outside learners from those who joined from the prison, hence, inclusiveness.

## Inclusive Education

"Definitions of inclusion within the field of disability often lack semantic clarity and ignore prior scientific conceptualization" (Limbach-Reich 2015, 359). Penney et al. (2018, 4) note that the term "inclusion" remains nebulous, given to differing interpretations. "Inclusive education is a reform that supports and welcomes diversity among all learners and should lead to the eliminations of social exclusion that stems from attitudes and responses to diversity in race, social class, ethnicity, religion, gender and ability." To understand the concept of inclusion therefore, changes in educational and social system should be of paramount recognition. Bernhard (2012) raises thoughts as to the clarity of the word, "inclusion" as this does not present a clear, sound understanding and generally accepted basis in relation to its meaning. Limbach-Reich (2015) clarifies, yet making the concept of inclusion controversially complicated by noting that the term, inclusion, etymologically means "integration" which invariably means "untouched," "unscathed," and in a larger sense "honest." In broader view, "inclusion" can be traced to the Latin word "includere" which means "being within," "imprisonment" or "to be incarcerated" (Ibid., 359). Locht (2008) is of the view that the idea of inclusion does not denote a positive meaning as portrayed in its usage today. In the medical period, the idea of inclusion was related to persons who exclude "themselves in abbeys, hence, shutting themselves out from the world". This understanding, yet, may not fit into the concept of sound governance which this study pursues. Limbach-Reich (2015), Markowetz (2007), and Plaisance (2010) posit that "inclusion" and "exclusion" have formed an integral part of international issue, and both concepts are based on a historical and cultural interpretation which differs from their contemporary usage.

In the education subsystem, what does "inclusion" stand for? In the work of Comenius (1896), inclusion means full acceptance, participation and integration. This idea would certainly appeal to the entry of this study. His concept of IE is so important to this study as he approaches the thought from the angle of everything being taught in-depth to everyone. This is SG. It is inclusiveness in education and depicts inclusive and integrative thoughts. UNESCO (2005) maintains same thought that inclusion means that all learners – the able and disable should have a mainstream study and provide support for each other. Hence, "... a process of addressing and responding to the diversity of needs of all learners through increasing participation in learning culture, and communities and reducing exclusion within and from education. It involves changes and modification in content, approaches, structures and strategies with a common vision which covers all children of the appropriate age range, and a conviction that it is the responsibility of the regular system to educate all children."

Igbokwe et al. (2014) see a variation in the concept of inclusion by the UNICEF. These scholars identify that a part of these variation tends to exclude inclusion from mainstreaming. While some definition and interpretation advocate that all learners should receive education together with their peers in the same setting, others take the stand that there should be a separate schooling or special learning centers for children who are incapacitated in one way or the other. Zimpel (2008) expands a similar outlook when he writes that Comenius' idea of IE has been watered down so that "everyone" in his concept of it means "every normal or standard student," while "everything" as he used the word means "society useful matter" and his use of "teaching" standing for instructing or reinforcement. Also, this interpretation of Comenius' view of inclusiveness by Zimpel is rather subjective, creating room for a learning process that is not integrative of all learners. This is anti-sound governance. Feuser (2002) analyzes the idea of inclusion in relation to Comenius' writing, that IE is a drawing board of instruction that aims at teaching everything to everyone in a setting where supports are provided according to the special needs.

In most of these conceptualizations, one thing still remains profound. Every form or perception of IE singles out learners with disabilities. Even in andragogy, the emphasis has fundamentally included adults with mental derangement, physical disabilities and other forms of incapacitation. Anyanwu (2002) observes as at the time of her writing that no prison in Nigeria has a school for IE. This explains the nature of prison governance in Nigeria. Ahiante (2008) lends credence to the notion that a study of the recidivism rate in Nigeria shows that 87% of the prison inmates have literacy problem; literacy problem because many come unlearned, serve their term unlearned and are go unlearned. The prisons (as an institution) in its governance and management are thus disabling instead of empowering.

Still making an overview of the concept of IE, if IE is synonymous with mainstream learning, one wonders how inclusive is prisoners education at CSSS Ai where learners are completely shut out from the world with very limited and restricted exposure to the conventional instruction and practice of curriculum. Inmates are not exposed to full curriculum which conventional schools use. Writing on teachers to curriculum implications for IE in Nigeria, Igbokwe et al. (2014) explain that IE should re-structure institutions, classrooms, methods and approaches of learning in order to meet the demand of students with special needs. Booth (1999) clarifies that the inclusion must "boost learners participation and reduce their exclusion from the curriculum, culture and communities of neighborhood and conventional centers of learning." To this effect, IE entails that participants in the learning process with or without disabilities, should learn together and provide support for each other so as to eschew or remove entirely every form of discrimination and stigma, and by so doing ensure everyone's self-worth, self-esteem, and self-dignity. This is the idea of SG.

In the humanist view supported by Duguid (2000), a fundamental intactness of learners (prison inmates) is suggested and this study picks special interest in that. Following the experiences and observations of one of these co-researchers who has been teaching in the prison school for over a dozen of years, this study on one part reasons with the humanists that think of the incarcerated as intact. The Amnesty International (1996) notes that IE should adapt to the needs of the participants and UNESCO (1994) within the Salamanca basis for action on special needs education point out that several reactions guiding the idea of inclusion agree that the learning center should accommodate all learners regardless of their physical, intellectual, social, emotional, linguistic, or other challenges. Limbach-Reich (2015, 362) puts it thus: "This should include disabled and gifted children, street and working children, children from remote or nomadic population, children from linguistic, ethnic or cultural minorities and children from other disadvantaged or marginalized areas or groups . . . providing a child-centered pedagogy, meeting their need."

Looking at the issues and beliefs surrounding the "disabled" individuals in Nigeria, it is believed that any form of an individual's physical incapacitation is attributed to sundry things, probably as a result of hidden crimes committed against the supernatural or humans. Hence, the attitude accompanying this kind of belief gears towards the rejection, isolation and stigmatizing the disabled. Such belief is worse among prisoners and Anyanwu (2002) echoes same view when she writes unequivocally that everybody in the prison is guilty; an unrepentant sinner that does not need any form of sympathy. This is the society's dominant view and feeling which tends to undermine any form of association, integration or inclusion of prison inmates. This has also greatly influenced the image of Nigeria Corrections to the degree that the idea of SG within the system is conspicuously contradictory. Igbokwe et al. (2014) highlight this culture effect in prison governance when they note that even in the face of exposure and civilization, many, particularly from the developing countries still see disability as a curse which can be contagious.

Inclusion completely rejects the idea of a separate classroom or school for disabled learners. Okeke-Oti (2010) views IE in the light of the Universal Basic Education whereby students with different abilities and needs are seen together in mainstream classes where their diverse needs are met. Therefore,

(i) A child should not be discriminated against on the account of disability.
(ii) All children should attend the same school regardless of their incapacitations.
(iii) The same education program should be used for all students but special attention should be paid to the needs of the handicapped.
(iv) There should be zero tolerance for exclusion with equal participation in the entire learning process.

In view of SG, IE could be understood as an implementation of the Education For All (EFA) initiative of the UNESCO (Ekwunife 2016) and an offshoot of Millennium Development Goals (Igbokwe et al. 2014) which is the rung for SDGs.

In summary, the concept of IE can be understood in different perspectives but not all of them fall within the purview of SG. Such terms are inclusion, integration, separation, and exclusion. Contextually speaking, while inclusion may mean "being within," that is "scattered among each other," integration suggests bringing the able and the disabled in a mainstream class with the latter still excluded to be recognized specially. Separation denotes having two different environments and settings for both learners, probably within same bigger environment while exclusion refers to the total removal or rejection of the disabled in the learning process. In this case, they are completely disregarded and sidelined. For the purpose of this study, the term "inclusion" is appropriate for the type of IE that is all-embracing, participatory and SG-oriented. Other terms do not connote the idea of SG (see Fig. 1).

**Sound Governance and Inclusive Education: A Case of Correctional Service Special School Abakaliki, Nigeria, Fig. 1** Different Perspectives of Inclusive Education

## IE and Prison Management

Fronting Reintegration, Erny (2013, 1) writes: "While the majority of literacy education takes place within a school setting, it can be found in infinite situations. It can even be found within incarceration facilities . . . open doors to opportunities for literacy professionals seeking employment outside of school districts in today's struggling economies."

In the US Federal prison system to be precise, Harer (1995) highlights that prison inmates who do not have a high school diploma or the General Education Development Diploma (GEDP) are expected to undertake a minimum of one literacy course while other inmates are encouraged to take the courses. English as a second language (ESL) is a literacy program required of English Language learners (ELL) within Federal Prisons in the USA. Davis et al. (2014) observe keenly that prison inmates who have access to general learning and vocational training are less likely to be recidivists. This points to the intended the role of SG as a phenomenon that empowers the inmate for meaningful re-entry into the society. It underscores education as a social control, particularly as it relates to the rehabilitation and re-absorption of prison inmates. Such education – either theoretical or vocational – enables the released prison inmates to find employment which peers who do not have such opportunities cannot. This is the overall idea behind correctional education in a correctional institution like the prison yard which this paper seeks to address.

In Nigeria to be particular according to Ekwunife (2016), the rationale behind IE in the prison yard should be to advance the fourth objective of the NPS – Reintegration, which to a great and alarming extent has been a picture in phantasmagoria. Armstrong (2006) gives voice to same thought when he emphasizes the need to provide persons with intervention program and policies aimed at curtailing antisocial and offending behavior in the future. The same study also highlighted on intervention programs like IE to provide persons experiencing high social deprivations with future opportunity. This agrees completely with SG. Considering the four cardinal objectives of NCS, keeping an inmate in safe custody is not the problem: Reformation and rehabilitation can as well be achieved through a haze of punitive "tough on crime" and psychotherapeutic measures as observed by the above researcher but the most problematic among the objectives is the fourth – "Reintegration" (Ekenta 2009), because the NCS has not fashioned out implementable programs that take care of the post-release life of the incarcerated. The penal system does not provide the enabling environment for such governance that incorporates the purported IE. Davies (2013) explains that inmates who participate in correctional education programs have 48% lower odds of recidivating than those who do not. Employment after release was discovered to be 13% higher among prisoners who took part in either academic or vocational education, and those who received vocational

training were 28% more likely to be employed during their post incarceration life.

The importance of IE in prison management is of maximum interest in this study. If done in light of SG, it prepares inmates to return to their communities and also gets absorbed without returning to the prison. In a study carried out by this researcher in the USA, four in every ten inmates released find their way back to prison within 3 years of release. Going by this, it questions the governance in the prison institution. Researchers generally believe that education for prisoners reduces criminal activities in the future through the impact of increase in cognitive skills which modifies behavior. Recidivism and unemployment are inseparable, and unemployment is closely linked to lack of education (Bennett 2015).

Buttressing the effectiveness of IE in prison management, Cook et al. (2012) lament on the adverse effect of "get tough on crime" approach as a phenomenon that has aided significantly the increasing population of recidivists. Bierens and Carvalho (2011), Pettit and Lyons (2009), Thompson and Cummings (2010), and Vacca (2004) view prison management as something that requires education and training since insufficient or lack of education/training increases the possibility of unemployment, hence criminality. It should be noted that education in the light of PR emphasizes more of reinforcement and less of punishment while prisons upholds penal principles which are the last resort as a strategy used by PR in managing conflicts. Lahm (2009) explains that offenders who participate in education programs while in custody have fewer rule violations during incarceration because they spend less number of hours behind bars where they could have been with nonschool-participating offenders perfecting new acts of criminality. Correctional education program is therefore necessary for the success of persons who are difficult to employ and released prison inmates fall into this category. In prison governance, IE has the capacity to create in inmates an awareness of soft skills which are personality traits, communication, language, and characteristics that may be acquired in interrelationships (Bloom 2006).

Scurrah (2008) argues that those on remand (ATPs) and on sentences less than 6 months (simple offences) in the USA have no access to learning opportunities because such inclusive learning would expose them to higher negative informal learning experiences which will in turn make them more criminally ingenious, highlighting their knowledge of criminality, and contacts which promote recidivism. The implication here is that there are cell and offence categorizations. In Nigeria, however, there are rarely cell classification and offence categorization in NCS (Agomoh 2008; Obioha 2011; Shajiobi-Ibikunle 2014; Onimajesin 2006). This spells doom for behavior modification and defies sound governance.

Corroborating this view, Ekwunife et al. (2016) and Adetula et al. (2010) observe that the criminal law makes the less hardened criminal tougher on criminality and strengthens the rise in recidivism. Since this is the condition in NCS, there appears no justification for barring the ATPs from participating in the learning process at PSS Ai, since "when placed in the same system, people, however different, tend to produce similar results" (Senge 1990, 42). On this same issue, this paper argues that IE should be a right to ATPs, and of course all inmates in NCS considering the absence of cell classification by age and offence, and interminable judicial proceedings which keep detainees for donkey years. It is Education For All (UNESCO 1994, 2005).

Aside the use of corrective education program to reduce the likelihood of reoffending through employability, Hawley et al. (2013, 9) note that education and training "is an imperative in its own right," and prisoners should not relegate this right of accessing education while in prison. It is also helpful in this study to note that according to international conventions and recommendations, offenders in prison custody have the same right to education as other citizens. As an imperative, the United Nations has approved conventions for member states in this regard. The standard minimum rules for the treatment of offenders emphasizes the relevance of education and training for prisoners and also their integration into mainstream classes. The 1990 Basic Principle for the treatment of prisoners also advocates this

educational inclusion of prisoners with specific reference to "cultural activities and education aimed at the full development of the human personality" (Ibid., 9).

The right of education for prisoners is also enshrined in the European convention for the protection of human rights and fundamental freedoms which clearly states that "No person shall be denied the right to education, the European charter also outlines the right to work, the right to vocational guidance, and the right to vocational training." It is also necessary to understand that education for both the ATPs and the CM would be of help to the generality of the inmates by instigating in them a sense of belonging that they remain a part of the larger society and this will remain a constant remind to them that they will be reabsorbed into the wider community on release. Excluding the ATPs from the prison education program, therefore, is alienating them from the society and negates the inclusive and democratic nature of education as a right for all, hence a relegation of Victor Hugo's powerful quote that "he who opens a school door, closes a prison." Another major rationale for an advocacy for the inclusiveness is on the backdrop that even in many other nations of the world, the level of education among prison population is low with many prisoners lacking basic literacy and numeracy skills (Ekwunife 2016). In the Irish prison, for example, literacy survey shows that about 53% of the entire prison population had literacy level 1 in the National qualifications framework which is the lowest literacy level.

In conclusion, basic education up till the tertiary level is springing up all over the globe in the light of prisoners' reformation, rehabilitation, and reintegration. The exclusion of any category of prison inmates such as the ATPs seriously negates the policy of education for all (EFA) and does not protect or project the underlying tenets of IE in the light of SG. The consequence of excluding the ATPs could be fatal in achieving the reintegration objective of the NCS and in the long run, could negate the attainment of the SDG goal 4 which aims at ensuring inclusive and equitable quality education and promote lifelong learning opportunities for all. However, disadvantaged groups are still excluded and the quality of education remains very poor. Inclusive actions still need to be done in prison–prisoner education and the development of the correctional administrative platform which the CSSS Ai stands for. In the CSSS Ai, for example, inmates' education, (excluding the ATPs) which may be defined in the writing of Kastl (2010) as inclusion, integration, separation, or exclusion, leaves much questions unanswered. This agrees with the findings of Garuba (2003) that the practice of inclusive education is still underdeveloped in Nigeria as a result of the challenges posed by inclusion policy and implementation.

# Spiritual Leadership

Louis W. Fry
Texas A&M University – Central Texas, Killeen, TX, USA

## Synonyms

Leadership; Public administration; Public service; Spiritual leadership; Workplace spirituality

## Introduction

Given an environment of seemingly unending crisis, the search for new models for effective leadership in the public sphere has never been more urgent. Cycles of domestic and global recession, international debt crises, multiple armed conflicts, and national and global disasters each challenge the leadership skills of public administrators. Often this calls for continuously improving processes, programs, and partnerships on a very tight budget as well creating, caring, service-oriented cultures for both public servants and citizens. Each of these challenges is a monumental task in and of itself and underscores the importance of identifying and understanding what constitutes effective leadership in public administration (Kellis and Ran 2013; Vigoda-Gadot and Beeri 2012).

Even in the midst of increasing uncertainty and chaos, there is still debate concerning the appropriate role of leadership in the public sector since the profession of public administration has yet to embrace leadership as a fundamental element of successful practice (Kellis and Ran 2013). This is in good part because public administration has traditionally been framed within its historic administrative, political, and legal traditions, each of which has its own view on the place and role of leadership. These distinctions have inhibited a robust exploration of the definition and function of leadership, which has caused the field of public administration to struggle for consensus on whether leadership, except at the highest levels of government, is a necessary responsibility of public sector executives and workers.

There are several reasons for this lack of consensus. One is because leadership has conventionally been portrayed as based in power, charisma, and transformational forces in the public arena (Burns 2009). There are also the assumptions that acts of leadership are reserved for the political elite, legislative representatives, top agency leaders, managers of cities, and other local governmental agencies or any other individuals who are granted political authority to make decisions through the democratic process. Following this assumption, lower level public workers are viewed as technocrats charged with unquestionably implementing the programs and policies resulting from these decisions. Finally, and perhaps most importantly, the lack of a clear disciplinary home for leadership in general inhibits validating the relevance of leadership in public administration scholarship. How can public administration achieve consensus on a definition and practice of public administration leadership when there is no consistently agreed-upon general definition of leadership and no clear understanding of the boundaries of the leadership construct (Rumsey 2014)?

## Spirituality: A Foundation for Leadership in Public Administration

Given the above confusion, what is a logical process by which one may proceed in laying the foundation for a workable model for leadership in public administration? As in all theory building, when there is lack of a dominant paradigm (Kuhn 1970) and constructs are in the concept/elaboration stage of development (Hunt 1999), certain fundamental assumptions must be explicated that serve as theoretical foundation from which subsequent theory may be built. One such assumption for this is that the spirituality that underlies the world's spiritual and religious traditions, which at their core are based on loving and serving others (Fry and Kriger 2009), can provide this foundation. Within this context, "spirituality"

refers to the quest for self-transcendence and the attendant feeling of interconnectedness with all things in the universe. The spiritual permeates all actions, including what we think and speak, the way we physically present ourselves, how we enter relationship, and the way we spend our time and money. Although spirituality is most often viewed as inherently personal, it can also reside or manifest in groups and organizations. From this perspective, a religion is an institution which has formed and evolved over time around the spiritual experiences of one or more founding individuals that also provides the context for leadership based upon the beliefs and practices inherent in that religion. Thus religion is concerned with a theological system of beliefs, ritual prayers, rites and ceremonies, and related formalized practices and ideas, while spirituality is concerned with those qualities of the human spirit such as love and compassion, patience, tolerance, forgiveness, contentment, personal responsibility, and a sense of harmony. From this perspective, spirituality is necessary for religion, but religion is not necessary for spirituality (Fry 2003). The common bridge between spirituality and religion is that both are based on a vision of service to others through love or other-centeredness as exemplified through the golden rule.

Although an actively researched area, the role of spirituality in the workplace is a relatively new field of inquiry (Benefiel et al. 2014). The extant literature has generally treated it as the missing attribute of both organizational life and organizational effectiveness in the absence of which an understanding of corporate reality remains limited and incomplete. Also seen as essential is a sense of transcendence, of having a calling through one's work or being called (vocationally), and a need for social connection or membership. The most widely accepted definition of workplace is offered by Giacalone and Jurkiewicz (2003, p. 13):

A framework of organizational values evidenced in the culture that promotes employees' experience of transcendence through the work process, facilitating their sense of being connected in a way that provides feelings of compassion and joy.

Workplace spirituality has received some interest concerning its relevance for public administration. Bruce and Plocha (1999) was one of the first to explore what it means for public servants to not be able to express their spirituality in a workplace where employees are considered, above all, fiduciaries of public money and property and encouraged to be technocrats who, know, obey, and enforce the law in a value-neutral, dehumanized workplace. Others note that there are elements of spirituality inherent in public service as a "calling." Drawing from public service motivation (PSM) theory, Bozeman and Su's (2014) review revealed that the majority of definitions of PSM view public service as a calling that attracts persons more likely to be motivated by intrinsic aspects of work than by monetary awards. Frederickson (1997) refers to the "calling of the public service," which is based on benevolence at the heart of the "spirit of public administration." For Gawthrope (1998), public service is based on duty as a love or an intense inner commitment to a cause that extends beyond the needs of the moment. There is also research indicating that public service employees are more spiritual in their attitudes than others in terms of transcendence, compassion for others, the experience of interconnectedness, and life meaning (Houston and Cartwright 2007).

## Spiritual Leadership

A special issue on spiritual leadership in 2005 in *The Leadership Quarterly* served as a vehicle for advancing the field of spiritual leadership as a focused area of scholarly inquiry (Fry 2005). In that issue, Dent et al.'s (2005) qualitative review of 87 articles led them to propose that there is a clear consistency between spiritual values and practices and leadership effectiveness. In a second review, Reave (2005) argues that values that have long been considered spiritual ideals, such as integrity, honesty, and humility, have a positive influence on leadership success.

A theme emerged from the special issue suggesting that fundamental to both workplace spirituality and spiritual leadership is an inner

life that nourishes and is nourished by calling or transcendence of the self within the context of a community based on the values of altruistic love. Satisfying these spiritual needs in the workplace positively influences human health and psychological well-being and forms the foundation for both workplace spirituality and spiritual leadership.

One model of leadership that has been tested widely is based on spiritual leadership theory, which is intentionally couched at the spiritual level so that it can be applied in both religious and nonreligious organizational settings (Fry 2003, 2008; Fry and Nisiewicz 2013). In addition to the foundational assumption concerning spirituality discussed above, the theory also adopts a foundational definition of the leadership construct based on the work of Kouzes and Posner (2012) who define leadership as the art of mobilizing others to want to struggle for shared aspirations. Building on this foundation, spiritual leadership involves intrinsically motivating and inspiring workers through a transcendent vision and a corporate culture based on altruistic love. It is viewed as necessary for satisfying the fundamental needs of both leader and followers for spiritual well-being through calling and membership; to create vision and value congruence across the individual, empowered team, and organization levels; and, ultimately, to foster higher levels of employee well-being, organizational commitment and productivity, social responsibility, and performance excellence (Fry 2003, 2008; Fry and Nisiewicz 2013).

Essential to spiritual leadership are:

1. Creating a vision wherein leaders and followers experience a sense of calling so that their lives have purpose, meaning, and make a difference
2. Establishing an organizational culture based on the values of altruistic love whereby leaders and followers have a sense of membership, belonging, and feel understood and appreciated

While there are innumerable theological and scholarly definitions of love, we focus here on a definition based on the golden rule (Fry 2003). Altruistic love in spiritual leadership is defined as "A sense of wholeness harmony and well-being produced through care, concern, and appreciation of both self and others" (Fry 2003. p. 712).

The source of spiritual leadership is an inner life or mindful practice. Inner life speaks to the feeling individuals have about the fundamental meaning of who they are, what they are doing, and the contributions they are making. Inner life in spiritual leadership is a quest for a source of strength that fuels hope/faith in a transcendent vision to love and serve others. It includes personal practices such as meditation, prayer, religious practices, yoga, journaling, walking in nature, and organizational contexts (e.g., rooms for inner silence and reflection) to help individuals be more self-aware and conscious from moment--to-moment and draw strength from a higher power, be that a nondual being, God, philosophical teachings, pantheistic divinity, or orderly humanistic social system (e.g., family, tribe, nation state) (Fry and Kriger 2009; Fry and Nisiewicz 2013).

Figure 1 depicts how the spiritual leadership model works. A commitment to an inner life or mindful practice positively influences spiritual leadership, which is comprised of hope/faith, vision, and altruistic love. Spiritual leadership then produces a sense of spiritual well-being through calling and membership that, ultimately, positively influences important individual and organizational outcomes such as:

1. Organizational commitment – people with a sense of calling and membership will become attached, loyal to, and want to stay in organizations that satisfy these spiritual needs.
2. Unit productivity – people who experience calling and membership will be motivated to foster work unit continuous improvement and productivity to help the organization succeed.
3. Life satisfaction – people with a sense of calling and membership will feel more fulfilled by having a sense of purpose and belonging and therefore will perceive their lives as richer and of higher quality.

**Spiritual Leadership, Fig. 1** Model of spiritual leadership

Research on spiritual leadership theory to date reveals that it predicts a number of important individual and organizational outcomes across various countries and cultures. These outcomes include being positively related to organizational commitment, job satisfaction, altruism, conscientiousness, self-career management, sales growth, job involvement, identification, retention, organizational citizenship behavior, attachment, loyalty, and work unit productivity and negatively related to interrole conflict, frustration, earning manipulation, and instrumental commitment (Benefiel et al. 2014).

## Spiritual Leadership in Public Administration

Scholars have also begun to explore the role of spiritual leadership in public administration. Ferguson and Milliman (2008) discussed the key reasons why most organizations have not developed effective core organizational values and concluded that leadership based on spiritual principles is important as is articulating a higher cause or purpose, being authentic, and being in service to developing and empowering employees. In advocating whole-soul (spiritual) leadership, Fairholm (2004) assumes that people have only one spirit, which manifests in both their personal and professional lives and thus leadership must engage employees at this level. Spiritual leadership from this perspective integrates these two into a comprehensive system that fosters continuous growth, improvement, self-awareness, and self-leadership that links one's interior world of moral reflection with their outer world of work and social relationships. This translates into public administrators who are more organizationally sophisticated, better able to deal with public issues and policies as well as facilitate success in an increasingly complex world. Recent research by Fairholm and Gronau (2015) focused on the leadership practices of local public administrators and whether they displayed elements of spiritual leadership so that the best in people is liberated in a context of continuous improvement of self, culture, and service delivery. Themes that emerged from their study of municipal managers revealed that what seemed essential from a spiritually sensitive leadership perspective was building community and individual wholeness, fostering an intelligent or learning organization, setting high moral standards, and inspiring others toward service.

Although the research is limited, spiritual leadership theory has received promising support in studies of public sector organizations. A study of municipal employees conducted in a medium sized Texas city, which included different departments such as police, fire department, administrative, parks and recreation, and utilities, found strong support for the spiritual leadership model, especially concerning the role membership plays in positively influencing employee commitment and unit productivity (Fry et al. 2007). An extensive mixed method study of the Centre for Excellence in Leadership (CEL), a public service agency that operated within the further education sector in the United Kingdom, revealed that CEL's CEO and her leadership team exemplified

spiritual leadership in action as evidenced by high levels of spiritual leadership throughout the organization. These findings were gleaned as a result of a two-phase longitudinal study on organizational effectiveness and well-being that included administering the spiritual leadership survey to all staff as well as conducting a vision/stakeholder analysis to establish a baseline and raise key issues for organizational development interventions (Fry and Altman 2013).

## Conclusion

Regardless of the current lack of consensus of the value of leadership in public administration, it should be clear that leadership and the importance of developing effective leaders in public administration at all levels is imperative given the increasingly complex administrative, political, and legal challenges they face. Forces such as generational turnover due to baby boomer retirements at all levels of government and nongovernmental agencies make it all the more critical that developing and nurturing the leaders that will follow them be given the necessary leadership models, methods, and tools to be successful. Most importantly, the current practice must be changed whereby leadership education and development resources are primarily deployed at the executive level with little assessment of the needs of public administrators throughout their careers before they reach such pinnacles of success.

Based on fundamental assumptions concerning the nature of spirituality and leadership, it is proposed that workplace spirituality implemented through spiritual leadership can serve as a model for public administration that will empower public sector leaders to more effectively deal with the daunting challenges they face in an increasingly unstable, chaotic, and frenzied task environment. Given the emerging research on public service motivation and the revelation that public sector employees are more altruistically motivated and have a calling to serve others (Bozeman and Su 2015), it seems logical to adopt a leadership model for public administration that reinforces these spiritual qualities.

# Spirituality and Health Policy

Gloria J. Billingsley
Jackson State University, Jackson, MS, USA

## Synonyms

Healthcare policy; Religion; Religiosity; Religious involvement; Religiousness; Spiritual beliefs; Spiritual commitment; Spiritual practices

## Definition

Spirituality is the search for relationship, meaning, and interconnectedness between an individual and a higher power, others, and nature as expressed through a set of beliefs, culture, and practices.

Health policy consists of all legislative mandates and public sector administrative and private sector policies and procedures that impact the health of a population.

## Introduction

The connection between spirituality and health is not new. Before there was organized medicine in the modern context in which we currently understand it, the family leader or some other culturally approved hierarchical structure determined appropriate healthcare treatment for its members. Prior to the twentieth-century push for more scientifically based medical education, medicine and spirituality were inextricably linked. Furthermore, many of the medical facilities and hospitals in the USA were birthed by religious organizations and groups. Additionally, most major religions (Christianity, Buddhism, Confucianism, Hinduism, Islam, Judaism, and Shamanism) have tenets, principles, or spiritual practices that focus on the relationship between spirituality and health. The focus comes in two spheres: (1) the healing properties of the spirit and (2) negative health outcomes being punishments resulting from a violation of religious practices/traditions. The very nature of man as triune being, body, soul, and spirit speaks to the centrality of role of spirituality in wellness and wholeness. While there is growing evidence that the integration of spirituality into patient care improves health outcomes, the relationship between the two is complex. The complexity in understanding the relationship between these two variables is exacerbated by variations in religious beliefs and practices and geographical differences in how religious tenets are practiced in healthcare settings. The lack of clarity is further complicated by the wide array of concepts that are used interchangeably in the

literature to describe or is used as a proxy for spirituality. Concepts such as religiosity, religious involvement, spiritual commitment, religion-based practices, and faith-based interventions all add to confusion and tension in understanding the role of spirituality and health policies.

## Creating a Common Understanding

The contemporary study of the impact of religion on health outcomes can be traced backed to the 1953 groundbreaking work of Moberg which looked at the impact of church membership on the ability of older adults to cope with issues of daily living (Moberg 1953; Krause 2011). Since the publication of this seminal work, there is considerable literature attempting to examine the relationship between spirituality and health and how the relationship between these variables impact health and healthcare policy. While there is a search for relational understanding, there are two major issues that tend to blur our understanding: the lack of a macro-level theory and lack of conceptual clarity on key concepts.

The lack of conceptual clarity on key constructs and concepts further impedes the development of a common understanding of the role each plays. First, there is a lack of consensus on the definition of spirituality. A review of the various definitions seems to suggest that the definition of spirituality is individual and context driven. The categories of definitions seem to revolve around five themes: (1) sacred relationship between individuals and a higher power than oneself; (2) acts or characteristics that denote spirituality, e.g., participating in organized religion, praying, meditating, reading scriptures, and giving to charity; (3) spirituality as synonymous with religion; (4) the domains of spirituality; and (5) the private search for meaning of life and one's existence.

Another construct that impedes our understanding of the relationship between religion and health is the use of religion as a proxy for spirituality. While religion is often used synonymously for spirituality, religion is a unifying set of doctrine, tenets and beliefs, and practices relative to a God or set of gods. These belief systems are expressed through social systems that often provide monitoring and oversight to ensure adherence to the tenets of the religion and often describe or enforce punishment for violators. The literature presents several dilemmas in defining religion that could have impact on understanding its relationship to health outcomes and health policy. Authors have posed several issues in trying to understand religion and its evolution in the research literature. One issue for debate is whether the belief in God or gods is necessary to categorize a belief system as a religion. Another issue is whether active involvement is a prerequisite for a person to claim membership to a particular religion. Lastly, there is the issue of religiosity or the level of influence or role of religion as a determinant in societal affairs and personal decision making. While many still see spirituality as connected to religion, the definition has changed and broadened to include secular spiritual manifestations outside of its expression in organized religion.

## A Need for a Unifying Framework

The research literature does not provide a clearly articulated macro-level theoretical framework but instead identifies a series of minor theories in a quest for deeper understanding. Theory building occurs either as result of a need to explain observed phenomena or as a prediction of a proposed relationship between variables that is then tested. According to Merton's 1968 work on theory building, the development of these minor or sub-theories should serve as a foundation for the development of a macro-level or unifying theoretical framework. It is important not to minimize the value of these minor theories in expanding our understanding of the relationship of these two variables. However, the current set of theories are more descriptive than prescriptive in that few clearly detail how research in this area should actually be conducted. This is one of areas in the literature where there is general consensus among researchers.

There is a need for empirical evidence on the relationship between religion, spirituality, and

health. Traditional empiricism is about building predictive models to explain the nature of relationships between two variables or constructs. Researchers in this area are grappling with the development of a grand theory that brings these two differing perspectives into a unifying framework. Systems theory, God-mediated control, Maslow's expanded hierarchy of needs which includes the need for self-transcendence, and Erikson's developmental theory are all theories that have been used to explain how religion impacts health outcomes (Krause 2011).

Authors have identified the ability to measure spirituality as a precursor to determining the relationship between spirituality and health. Spirituality has been described as the 4th dimension of health, and as such efforts to measure spiritual health has led to the development of tools to measure spiritual health. A comprehensive literature review was conducted in 2011 to identify instruments available to measure the relationship between spirituality and health revealing the earliest being developed in 1983. The instruments identified measured four different dimensions of spirituality: general spirituality, spiritual well-being, spiritual support or coping, and spiritual needs (Monod et al. 2011). Several measurement tools have been developed to advance knowledge in this area: spiritual health scale (Dhar et al. (2012) in which three domains of spiritual health are measured – self-evolution, self-actualization, and transcendence. The Fetzer Institute conducted a study funded by the National Institutes of Health (NIH) to examine the key dimensions of religiousness/spirituality as they relate to physical and mental health outcomes. Fetzer presented outcomes of the study in a progress report that highlighted the research on each of the 12 domains (Fetzer Institute 1999). Additionally, the working group at Fetzer Institute developed the Brief Multidimensional Measure of Religiousness/Spirituality (BMMRS). For additional information, see http://fetzer.org/resources/multidimensional-measurement-religiousnessspirituality-use-health-research). The Daily Spiritual Experience (DSE) Scale was developed to measure how spirituality is expressed in the daily lives of ordinary people. The goal was to capture all of the ways spirituality may manifest outside of the "religious" context including the language used to describe it (Underwood and Teresi 2002). Later, Hall et al. (2008) provide a robust discussion of various instruments that have been used to measure religiosity and spirituality. These authors identified a number of instruments designed to measure: religious attendance and participation in organized religious activities, private religiousness, religious motivation/orientation (intrinsic and extrinsic), multidimensional measures of religiousness and functional measures of religiousness, religious well-being, religious coping, and others. The authors also provide information on the various scales used to measure these constructs. Problematic though is a lack of consensus between authors on what these constructs mean.

The third area where a common understanding is needed involves defining health. There are two models used to define health: the medical model and biopsychosocial model. The medical model definition describes health as the absence of symptoms of illness and disease. This model largely characterizes the United States healthcare system (Shi and Singh 2012). Internationally, the World Health Organization (WHO) has developed one of the widely used definitions of health. According to WHO, health is "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (WHO 1948).

## Spirituality and Health Policy: United States Context

The literature indicates that the quest for understanding of the relationship of religion/religious activities in the USA began in the 1960s (Levin and Vanderpool 1987). Interest in this phenomenon increased dramatically from the 1980s to near the end of the twentieth century (Flannelly et al. 2014). Intractable health disparities in minority populations have pushed the medical profession and public health officials to seek ways to reduce risk factors and increase factors that protect individuals and populations from the adverse consequences of many preventable and curable

diseases. Health researchers also seek to understand why various groups do not engage in health-seeking behavior, do not follow treatment protocols or plans prescribed by their healthcare providers, and do not participate in research designed to find cures for diseases that plague their communities. The quests for answers to these pressing health concerns have resulted in the examination of not only individual-level and population-level factors that impact health outcomes, but also the role of the environment in determining health outcomes.

The World Health Organization (WHO) established the Commission on Social Determinants of Health in 2005 consisting of individuals with diverse expertise and experiences. The Commission collaborated with policymakers, well-respected researchers, and nongovernmental entities to examine the available evidence on the social, political, and economic factors that influence individual and group differences in health outcomes. The work of the Commission was presented as social determinants of health framework that could be used to assist countries in promoting health equity and equality (WHO 2008). Countries represented by WHO provide annual updates to WHO outlining progress made in the Commission on Social Determinants of Health Framework area. The English version full report of the Commission's 2008 report can be found at http://apps.who.int/iris/bitstream/10665/43943/1/9789241563703_eng.pdf. The report is translated into other languages as well and can be found on the WHO website. http://www.who.int/social_determinants/thecommission/finalreport/en/

The social determinants of health address a wide range of the structural social determinants of health such as inequalities in education, income, discrimination, and poverty. Despite the growing collaborations between religious institutions and public health organizations in addressing health concerns in local communities, the centrality of religious practices and institutions in the lives of people around the world is conspicuously absent as a social determinant of health (Idler 2014). Even when it is acknowledged as a social determinant of health, religiosity is still not clearly understood (Maselko et al. 2011).

The First Amendment to the United States Constitution provides that Congress makes no law respecting the establishment of religion. The separation of church and state doctrine was solidified in 1947 Supreme Court Case Everson V. Board of Education which ruled that the Constitution distinctly calls for a strict separation of government and religion. For over a century, the prevailing belief was that government should shun the appearance of favoring one religion by refraining from using taxpayer dollars to fund any religious activity.

Foundations and faith-based organizations have a long history of addressing issues that governments refuse to or are unable to address due to legal restrictions. "Religious institutions occupy important roles and positions of power and influence (e.g., economic, educational, civic, and political) in their respective communities. Therefore, they possess legitimacy in the eyes of their communities, as well as the organizational roles, structures, and mechanisms that facilitate the development and implementation of health programs (Chatters 2000: 352)." The Robert Wood Johnson Foundation, a nonprofit health research organization, began to operate a Faith in Action program in 1983 focused on childcare givers. The work of the Robert Wood Johnson Foundation with interfaith organizations laid the groundwork on which the first federal charitable choice provision incorporated into the 1996 Welfare Reform Act (P.L. 104–193) heralded by President Bill Clinton which opened the door for religious organizations treated the same as any other nonprofit organization in terms of competing for federal funding and providing services to specific target populations. President George Bush expanded the provisions of charitable choice in 2001 and established the Office of Faith-Based and Community Initiatives. Under the Obama Administration, the influence of faith-based organizations was strengthened by reorganizing the Office of Faith-Based and Community Initiatives and changing the name to Office of Faith-Based and Neighborhood Partnerships and centralizing the 11 agency-level partnerships was expanded. Establishing these Offices and partnerships capitalized on over four decades of a symbiotic

relationship between religious institutions and public health organizations in problem solving and advocacy, health promotion, and service delivery (Levin and Hein 2012).

In the past 25 recent years, there has been a renewed interested in integrating spirituality into patient care to improve health outcomes and quality of life. This renewed interest is evident in the Association of American Medical Colleges in terms of clinical research, medical education, and healthcare delivery systems. Policies that are culturally appropriate have been shown to be more efficacious in addressing a number of health issues such tobacco use, cardiovascular disease, diabetes, hypertension, low birth weight, and HIV/AIDS. A major advantage of utilizing spirituality is that it helps to make policies culturally appropriate and easily integrated into the lives of those impacted by it. A person's belief system can and often does impact health decisions regarding whether or not they believe adiagnois, choice of treatment options & treatment compliance.

In the 1990s, there was a reemergence and national recognition that the integration of spirituality into healthcare was just as important as the actual medical intervention being offered. The Joint Commission on Accreditation of Healthcare Organizations, the American College of Physicians, and the Association of American Medical Colleges all issued policies regarding the role of spirituality. Medical schools began offering courses in spirituality and health as early as 1992. In 1999 the Association of American Medical Colleges recommended six learning outcomes around spirituality and cultural beliefs that all medical students must demonstrate before graduation (Association of American Medical Colleges 1999: 26).

## Spirituality and Health Policy: International Context

The integration of relationship between spirituality and health outcomes is also of interest to researchers, public health officials, and medical practitioners internationally. The diversity of religion and religious practices further complicates efforts to reconcile the literature and our understanding of the relationship between spirituality and the outcomes of health policy. Several policy efforts to integrate spirituality in health policy in a comprehensive way to affect most people are discussed below.

First, the National Health Services of the UK put forth policy recommendations as early as 1991 in the form of a *Patient's Charter*. While the intermingling of religion and healthcare was pervasive through the healthcare system, the *Patient's Charter* was the first attempt at making this right explicit (Pattison 2013). A search of national archives of the UK governmental publications for policies on religion, spirituality, and health appears to focus on these constructs as it relates to mental illness.

Second, the Health and Social Care Act of 2012 calls for the Secretary of State to protect the health of the United Kingdom (Health and Social Care Act 2012). The National Institute of Clinical Excellence (NICE) in the UK has provided clinical guidance on how to improve health and the role of spirituality and spiritual care in healthcare. According to the National Institute of Clinical Excellence Guideline "spiritual care is the responsibility of all health profession, although some patients many have specialized needs (Yardley et al. 2009: 601).

The World Health Organization (WHO) has published several reports addressing the need for spirituality in the provision of healthcare. *People Centered Health Care*: *A Policy Framework* was published in 2007 as a policy statement promoting patient-centered care as a guiding framework for its work to improve global health outcomes. A number of target areas were identified, but the one that has the most relevance to this discussion is responsiveness of care which was identified by WHO in 2001 as an important issue in terms of population health. It is under this policy framework criterion that WHO is calling for healthcare providers, facilities, and research institutions to integrate social, emotional, and spiritual support for patient, their families, and the staff who work at their facilities (WHO 2007).

WHO, academic institutions, and other public health institutions did not initially embrace the

concept of involving religion and religious practices in health interventions and questioned the efficacy of doing. Recognizing that a person's culture, values, attitudes, and health beliefs are often inextricably connected to spiritual beliefs and religious doctrine, WHO and others have come to understand that the question is not whether religion and spirituality should be considered when delivering health services but "when" and "how" they should be integrated into health promotion, prevention, and treatment of various public health threats.

The integration of spirituality in healthcare is also evident in countries outside of the UK. In the international context, spirituality and religion-based interventions have been used for tobacco control interventions in Saudi Arabia (Jabbour and Fouad 2004; Saeed et al. 1996), health impact assessments in Thailand (Chuengsatiansup 2003), and suicide in Buddhism (Keown 1996).

## Negative Aspects of Integrating Spirituality into Healthcare

While integrating spirituality and religion into health interventions ensures that service provision is culturally appropriate and relevant to the target population, it is not a panacea. There are several issues that must be accounted for as the push for religion-based interventions gain more traction. Some of the issues to be addressed are:

- The lack of sufficient evidence of efficacy of religion-based/spirituality-based interventions may be a setback in the hard fought battle for the use of evidence-based practices.
- Many religions have precepts and practices that may conflict with the need for medical care.
- There are ethical considerations in terms of who, when, what, and how should spiritual care be integrated to healthcare.
- Religious beliefs that promote and reinforce shame and blame which interfere with health-seeking behavior.
- Competition between religious leaders/denominations and healthcare providers and public health officials could arise to be seen as the authority on health-related outcomes.
- The lack of expertise of healthcare providers/public health officials relative to religious beliefs of their clients/target population could inadvertently increase psychological harm.

## Conclusion

Globally, there is a growing body of literature that supports the need to integrate spirituality into health policy and healthcare practices. However, the lack of conceptual clarity on the constructs of spirituality, health, and health policy complicates the discussion on the need for intentional strategies to address the spiritual needs of patients as a part of routine care. There are documented methodological challenges that must be addressed before a clear hypothesis of the relationship between these variables can be substantiated. While there is a growing number of instruments available to measure the various domains of spirituality and religiosity, a macro-level theory to solidify our understanding of the relationship between spirituality and health outcomes continues to be an area for research focus.

# Spirituality and Public Administration

AbdelRahman Ahmed AbdelRahman
Department of International Relations, University of Sharjah, Sharjah, United Arab Emirates

## Synonyms

Connectedness with higher entity; Public service as a calling; Spiritual Values; Spirituality; Transcendental experience

## Definitions

**Spirituality**: This is an individual/experiential sense of being connected with a higher entity that transcends the individual. Spirituality is individually/experientially, rather than institutionally, based. The spiritually oriented individual may be imbued with such values/virtues as benevolence, love for others, justice to others, altruism, compassion, etc. Spiritually oriented individuals may go through transcendental experience or connectedness with a higher entity. This higher entity may or may not be religiously based.

**Instrumental Rationality:** This refers to finding and using the one best or optimal means or instrument to achieve a given goal(s). Efficiency and cost-effectiveness epitomizes instrumental rationality insofar as it means achieving goals with the use of minimum available resources.

**Administrative Efficiency**: This refers to achieving organizational goals with the expenditure of minimum resources. It is cost minimization in goal achievement.

**Administrative Effectiveness**: This refers to how well, as distinct from how cheaply, organizational goals are achieved. It signifies the quality rather than the cost incurred in achieving organizational goals.

## Introduction

The study of public administration has long been anchored in a secular intellectual tradition. This is probably the outcome of its focus on instrumental rationality which was closely associated with scholars in the Progressive Era who, in the second half of the nineteenth century, sought to find solutions to the problems of political graft and administrative inefficiency which had plagued public service in the United States. The focus then was on finding the best or optimal means to achieve public policy goals with efficiency/economy and integrity in public service.

Since the inception of the study of public administration, instrumental rationality has remained the principal intellectual foundation of several approaches to public administration that have emerged over the years. This is centrally true of recent approaches (e.g., New Public Management or Mangerialism). Currently, instrumental rationality is epitomized by the guiding principle of "doing more with less" in the actual running of government. In this context, the emphasis on efficiency in government has resurfaced. Burgeoning fiscal deficits and fiscal stress in Western democracies have bolstered up the case for the pursuit of the goal of efficiency in government. Recent approaches in public administration (e.g., New Public Management or Managerialism) underscore this new emphasis, inasmuch as they extol the adoption of market values, particularly cost efficiency, in the running of government.

Discussion of any perspective on or approach to public administration needs, in all probability, to refer to the issues of administrative efficiency and effectiveness and bureaucratic responsibility/accountability or responsiveness to their clients. This is so because these are perennial issues in the practice and study of public administration. In fact, the first scholarly work credited with ushering in the study of public administration dealt with these issues (Wilson 1887). Consequently, the discussion of any approach in the field needs to have some perspective on these issues.

These issues are in fact goals sought by both practitioners and scholars in public administration. Despite, however, a plethora of mechanisms for ensuring public responsibility and administrative efficiency and effectiveness, many public bureaucracies may still be unaccountable, ineffective, and inefficient. According to Haque (1994), there is a consensus and concern in administrative and academic circles that the degree of bureaucratic accountability has declined in both developed and developing countries.

Traditionally, the quest for administrative efficiency has been at odds with the interest of the public employee/bureaucrat inasmuch as it considers only the technical competence of the employee and leaves out his feelings, beliefs, and values. In the evolution of management thought, approaches sprang up to incorporate employee feelings, dignity, and respect. This is particularly the case with the humanistically oriented management approaches. However, his beliefs and values, whether they are religious or spiritual, are left out both in public service and in management schools of thought.

Quite recently, however, spirituality was linked to public service and to the study of public administration. At its core, spirituality in public service is conceived of as encompassing a set of spiritual values and virtues of the individual public servant. Those values/virtues are thought to instill into the public servant intrinsic self-motivations that propel him/her to perform at the workplace.

## Strands in the Spirituality Approach to Public Service

Two principal thematic strands are discernable in spirituality in public service. One strand addresses the relationship between spirituality and work-related performance outcomes, particularly employee satisfaction and happiness, productivity, stress reduction, organizational citizenship

behavior, employee compassion for clients, ethical decision-making, etc. (King 2007; Nur and Organ 2006; Garcia-Zamor 2003; Fawcett et al. 2008; Bisesi and Lidman 2009; kazemipour and Amin 2012).

This strand is not different from traditional management or organizational behavior literature in that it seeks to account for work performance outcomes. The implicit view embodied in this literature is that of instrumental rationality which sees the predictors of these outcomes as mere instruments. In other words, those predictors (whether they are employee perceptions, attitudes, religious/spiritual beliefs, personality traits, etc.) are simply tools to be manipulated by organizational leaders to bring about organizationally desired outcomes.

A hard core strand in the relationship between spirituality and public service is the emphasis on values and virtues, particularly among public-sector practitioners and faith-based organizations. Notable values and virtues stressed are generosity, thrift, compassion, justice, fairness, benevolence, public service as a calling, selflessness, moral courage, transcendence, connectedness with God, etc. (Bruce and Novinson 1999; Bruce 2000a, b; Cunningham 2005; Lowery 2005; Collins and kakabadse 2006; Nur and Organ 2006; Houston and Cartwright 2007; McConkie 2008; Reimer-Kirkham and Sharma 2012; Fairholm and Gronau 2015). Absent from this emphasis are the traditional values of administrative organization, notably efficiency and effectiveness. Some have proposed that benevolence be the primary value in the public bureaucracy (Frederickson and Hart 1985). This is a departure from the primary focus on the value of efficiency which was the product of the Progressive Era's quest for rooting out political graft and other forms of corruption in public service. This emphasis on values and virtues has even prompted some to suggest a new management approach dubbed Management-by-Virtues, defined as "a management philosophy and practice based on virtues derived from religious beliefs" (Nur and Organ 2006).

Several observations stand out from the emphasis on spiritual values/virtues in public service. First, the traditional values of public service or administration (e.g., efficiency and economy) are no longer the dominant goals sought by spiritually oriented public bureaucrats and by faith-based service organizations. Spirituality rather than instrumental rationality is the foundation for the work of the employee. In other words, work in organizations, according to this approach, transcends the instrumental value of efficiency, as it seeks to achieve transcendental values – values that are derived from one's spiritual/religious beliefs rather than imposed by workplace entities. Spiritually oriented employees do not see themselves as instruments to be used by bureaucracies to achieve organizational goals. For them, work is a calling and an opportunity for introspection and connection. Work also provides them with meaning and purpose that transcends the workplace.

A second observation is that notwithstanding the growing literature on the relationship between spirituality and public service, the study of bureaucracy has largely avoided paying attention to the epistemological implications of this relationship. This is particularly the case with the potential empirical and theoretical knowledge that could be acquired from examining spiritual/religious concepts or traditions. Grounded in an ontologically and epistemologically secular intellectual tradition, the discipline of public administration has since its inception eschewed embracing spiritual/religious concepts or traditions. This is true of traditional public administration scholarship, as it is of more recent approaches, notably the New Public Management (NPM) and the New Public Service (NPS). Both NPM and NPS eschew religious/spiritual values and embrace secular values: market values (e.g., efficiency) as with NPM and democratic values (e.g., citizenship and social equity) in the case of NPS (Denhardt and Denhardt 2015). This secular approach is not without its costs; some argue that the intellectual secularization of public administration has prevented us from benefiting from the wisdom embodied in religions and spirituality (Lynch et al. 1997).

A third notable observation is that the relationship between spirituality and public service is predicated on the implicit and at times explicit assumption that the driving force for spiritually

oriented public bureaucrats is intrinsic motivation. Extrinsic rewards and punishments are not motivators for such employees who are self-motivated.

The emphasis of spirituality in public service on intrinsic motivation is based, obviously, on its spiritual approach. This is at odds with orthodox management theories where employee motivation is largely considered extrinsic. Indeed, in the evolution of management thought, employee motivation is seen to be a factor external to the employee and, consequently, subject to manipulation by organizational leaders. This is certainly the case with Scientific Management and Administrative Management, as it is with more recent approaches (Jones and George 2015).

A fourth notable observation is that empirical support for spiritual values influencing employee work motivation and performance was found in social service areas where such values as benevolence, compassion, love for, and justice to others may be at work. This is particularly the case with such areas as healthcare (e.g., nursing, geriatrics, etc.) and social work. Empirical support for the spirituality proposition was also found among employees working in faith-based organizations. Spiritual values germane to work in those organizations include public service as a calling, connectedness with God, benevolence, love for fellow human beings, altruism, and justice to others.

## View on Human Nature

The spirituality approach to public service does not embody any characterization of human nature. The approach does not posit that spirituality or spiritual values are ingrained in human nature. To be sure, spiritual values and beliefs are acquired, not innate. This is consistent with the fact that spiritual values are experientially based. Individuals adopt values and beliefs based on their experiences in the real world.

Other approaches in generic management thought imply specific views on human nature. For instance, organizational humanism implies that man loves work and responsibility and that he is not indolent. Scientific Management and Administrative Management thoughts, to cite another example, assume that man is by nature acquisitive and materialistic.

## Propositions on Work Motivation

The spirituality approach in public service implies that its core values provide the basis for distilling some propositions on public service work. The values and virtues of thrift, generosity, compassion, justice, fairness, benevolence, public service as a calling, selflessness, moral courage, transcendence, and connectedness with God are expected to generate three types of employee work motivation. These encompass motivation for efficiency and effectiveness in task/job performance, motivation for work and diligence, and motivation for serving clients.

### Motivation for Efficiency and Effectiveness in Task/Job Performance

As previously pointed out, administrative efficiency and effectiveness are not core values emphasized in the spirituality approach to public service. Nonetheless, the spiritually oriented public employee is expected to be committed to efficiency and effectiveness or quality at the workplace. This is the function of thrift with which the spiritually oriented employee is imbued. It therefore follows that the expectation of hedonistic self-gratification or reward is unlikely to be a motivator for such employees. Those employees are, essentially, intrinsically motivated by their connectedness with a higher entity or by their transcendental experience and by, concomitantly, the desire to carry out their responsibilities and tasks as efficiently and effectively as possible.

Whether such commitment is instilled in spiritually oriented public servants and whether it leads to efficiency and effectiveness in task performance are, to be sure, empirical questions. As such, they are testable hypotheses which can be checked against empirical reality. For instance, are public service employees and employees in faith-based organizations more

committed to efficiency and effectiveness in task performance than their counterparts working in other types of organizations? Are they more efficient and effective in task performance when technical competence and work environment are controlled for?

### Motivation for Work

The spiritually oriented public servant is expected to be motivated to love work, not to be indolent, and to be diligent. This is the function of the virtues and values of justice to himself/herself and to others, fairness, benevolence, and public service as a calling. Consequently, indolence and aversion to responsibility are expected to be out of the question for the spirituality-oriented public employee. Such an employee is expected to love work and seek even more workplace responsibility.

### Motivation for Serving the Public

The spiritually oriented public servant is expected to be self-motivated to serve his/her clients and the public at large. This motivation is the function of the values and virtues of love for others, justice to others, selflessness, benevolence, and public service as a calling. These values are expected to instill in the character of the public servant altruism, charity, humility, compassion, sympathy, optimism, a sense of personal responsibility, conscientiousness, and enthusiasm which motivate the public servant to serve his/her clients.

It is worth noting that modern public organization theorists have suggested that some of these values may so influence the character of a public administrator as to enhance his/her responsiveness to clients. The internalization of these values by public servants, they argue, is likely to make them "public-spirited" and thus responsive to the members of the public who seek their services. However, these theorists have not indicated how these values find their way into the character of a public official.

In sum, the spiritually oriented public servant is expected to be motivated to be efficient and effective in job performance, to love work and responsibility, and to be responsive to his/her clients.

## What Does Spirituality Mean for the Study of Public Administration?

Calls have been made for spirituality to be treated as an approach to public administration as a field of study. As an approach to the study of public administration, spirituality is quite relevant to the field in several respects. First, it provides concepts that may enhance the comparative study of public administration. Rooted in American culture, the study of public administration has been characteristically ethnocentric, notwithstanding the fact that the development of and quest for cross-cultural concepts in public administration still continue. Embracing spiritual values and virtues may contribute to freeing the study of public administration from its idiographic character, thereby contributing to developing a nomothetic discipline of public administration.

The concepts of the spirituality approach (e.g., benevolence, public service as a calling, love for others, justice to others, etc.) may be epistemologically useful. Cast though they are in a normative thrust, these concepts can potentially contribute to the accumulation of empirical knowledge on public service. As previously noted, empirically testable hypotheses can be derived from these concepts. The formulation and testing of such hypotheses may lead to the accumulation of a fund of empirically-based nomothetic knowledge that may be applicable in varied contexts. In turn, this will be addition to the body/theory of knowledge on public administration.

As Fred Riggs (1991) long noted, in a globalized world system, the need for the comparative study of public administration becomes all the more important. In such a world, nomothetic theories and concepts that travel cross-culturally are needed. Concepts and theories developed to explain behavior in specific cultural milieu may have limited applicability in diverse cultural/national contexts that are being brought increasingly together by globalization. Public administration needs, in the words of Fred Riggs (1991: 473), a framework that focuses on

> ... explanatory theories that account for the continuously changing properties and problems faced by governments as they seek to implement public

policies. Its normative guidelines will be anchored in empirical knowledge of the institutions and dynamics of any society in which they are employed.

The quest for means to achieve public policy goals is likely to continue to preoccupy practitioners and scholars in the field. In view of the diverse national and cultural contexts in which public policies are formulated and executed, the study of public administration has no option but to embrace cross-cultural or cross-national concepts. The spirituality approach to public service provides a few cross-cultural concepts that are expected to implant in the character of the public servant intrinsic motivations to be efficient/effective, love work and responsibility, and serve the public. All this underscores the need for public administration scholars to be open to consider the knowledge and wisdom that may be embodied in spirituality and religion.

Second, the spirituality approach to public service touches on the old politics/policy administration dichotomy which was an important intellectual foundation for traditional public administration as a field of study. This is so because public service, in contrast to public administration, encompasses both the work of elected public officials or public policy makers and also the work of public administrators or public policy implementers. It may thus revive the old dichotomy in the study of public administration. Nonetheless, this may not matter much because in the real world of public policy making and public policy execution, policy and administration are quite inseparable. The imperative for the separation of policy from administration belonged to an era when the exigencies of riding administration of the deleterious effect of political graft provided a rationale for separating administration from policy/politics which was considered inefficient or instrumentally irrational.

Third, as an approach in the study of public administration, spirituality would be quite akin to organizational humanism in several respects. First, it shares with this approach emphasis on intrinsic motivation that propels employees at the workplace. Second, both approaches see individuals as seeking meaning and purpose in their work. Third, in both approaches individuals are not indolent; they seek work and responsibility. Fourth, in both approaches, the thrust of the proposition is that the workplace is the arena where the values (both humanistic and spiritual) of the individual employee can be put into practice or be actually experienced.

The basic difference between the two approaches is that in the organizational context or workplace setting, spirituality emanates from the individual employee. In other words, spirituality comes into play when the individual employee is propelled to perform at work by his own spiritual values/beliefs. In contrast, organizational humanism comes into play at the workplace when organizational leaders create a work environment that enables humanistic values (e.g., employee respect and dignity) to be experienced by individual employees.

In sum, at the workplace, organizational humanism begins with organizational leaders whereas spirituality begins with the individual employee. This implies that humanistic values and practices can be manipulated by organizational leaders with a view to achieving organizational goals. In contrast, workplace spirituality is independent of the actions or inactions of organizational leaders.

# Staff and Volunteers

Egle Butkeviciene and Egle Vaidelyte
Faculty of Social Sciences, Arts and Humanities, Kaunas University of Technology, Kaunas, Lithuania

## Synonyms

Paid and unpaid staff; Paid and Voluntary Work

## Definition

Staff refers to all the people employed by a particular organization who receive a salary or other financial rewards for their activities.

Volunteers are people who are typically engaged in activities that in some way contribute to the good of the public, act from free will, are uncoerced by necessity or social obligation, and, although obtaining some benefits from engaging in volunteering, do not receive a salary or other financial rewards for their activity.

## Introduction

The nature of nonprofit organizations raises many questions regarding the people working for nonprofits, their roles, differences in management, and motivation practices.

One of the major questions raised in literature and practice is the one about compensating the people who work at nonprofits. The answer to this question depends on the type of nonprofit organization. There are nonprofit organizations that may be entirely volunteer-driven. However, many nonprofits employ some staff as well. Some organizations have several hundred of employees, while others employ just a few of key people and then rely on volunteers who do most of the essential work. Every organization can vary in proportions of staff and volunteers depending on organization's needs, size, budget, or the type of service the organization provides.

The volunteering is a complex and multidimensional phenomenon. Volunteers might differ from the paid staff in their motivation to engage in activities and their commitment to organization. This entry provides an overview of the roles and functions of paid staff and volunteers in nonprofit organizations and differences regarding management and motivation of paid staff and volunteers.

## Roles and Functions of Staff and Volunteers in Nonprofit Organization

This section explains the roles and functions of board, staff, and volunteers in nonprofit organizations.

Usually nonprofit organization has several functional positions of people involved in its activity: a board of directors, an executive director (ED) or chief executive officer (CEO), paid staff, and unpaid staff. Every organization can vary in proportions of these positions. Usually, board of directors and unpaid staff are acting as volunteers, while CEO or ED and paid staff receive the financial rewards for their activities in organization. The exception is all-volunteer organizations (AVO) that are nonprofit organizations managed and governed only by volunteers.

A board of directors is responsible for the strategic governance of organization (see Table 1). It has specific legal and ethical responsibilities to and for the organization. Board usually elects chair, the leader of the board. Chair is the chief volunteer position in a nonprofit organization. Board is usually responsible for determining the mission and purpose of organization and advocating for them, selecting and hiring a chief executive officer, and monitoring and evaluating his or her activities. One of the most important board's responsibilities is to secure adequate resources for the organization to fulfill its mission.

Board members must meet certain standards of conduct. For example, in the USA, the standard legal responsibilities of the board of directors are described as duty of care, duty of loyalty, and duty of obedience (GLOSSARY of Nonprofit Governance 2016):

- *Duty of care*: requirement that board members be reasonably informed about the organization's activities, participate in decisions, and do so in good faith and with the care of an ordinarily prudent person in similar circumstances.
- *Duty of loyalty*: a requirement that a board member remains faithful and loyal to the organization and avoids conflicts of interest.
- *Duty of obedience*: a requirement that a board member remains obedient to the central purposes of the organization and respects all laws and legal regulations.

Board of directors in nonprofit organization also carries a fiduciary duty. Fiduciary duty refers to a responsibility of nonprofit organization board members and a board as a whole to serve as trustee of the organization's assets on behalf of the greater community, responsibility for financial viability, and proper handling of financial matters.

The chief executive officer (CEO) or executive director (ED) usually is hired by the board of

**Staff and Volunteers, Table 1** The roles of board, CEO, paid staff, and volunteers in a nonprofit organization

| Board of directors | CEO and administrative staff | Paid staff and volunteers |
|---|---|---|
| Primary role: strategy | Primary role: management and administration | Primary role: implementation of activities |
| Nature of involvement: on voluntary basis | Nature of involvement: paid staff or on voluntary basis | Nature of involvement: paid staff or on voluntary basis |
| As the ultimate responsible body for the organization, it develops the mission and vision of the organization, creates the strategy for long-term impact ensures reputation, and carries a fiduciary responsibility | As the administrative body for the organization, usually performs the daily management of organization and ensures administration of organization's activities | As the body, responsible for implementation of organization's activities, paid staff and volunteers conduct most of the essential work related to the primary services the organization provides |

directors and is responsible for the daily management of the nonprofit organization (see Table 1). Although the role and responsibilities of the chief executive office vary widely depending on an organization's size, structure, and history, usually they include supervising staff, monitoring daily activities, managing important partnerships with donors, public officials, and leaders of other nonprofits. CEO or ED is the top staff position of a nonprofit organization. Usually he or she reports to the board about the functioning of organization. In some cases, CEO or ED may serve as a board member; however, such a situation is not encouraged due to ethical reasons, as the conflict of interest may naturally come along with the pairing of these two positions. If CEO or ED belongs to the board, it is advisable for him or her to act at least as nonvoting members of the board.

The role of the nonprofit CEO has evolved over the years due to the growth, complexity, and professionalization of the nonprofit sector. Thus, there are several models showing the possible relationship between the board and CEO (Moyers 2012):

- *Strong board and subordinate CEO*. This model was mostly common in the past. It emphasizes the strong leadership of the board and its role to supervise and control the executive. The CEO is obviously below the board in the organization's hierarchy. The board is likely to be involved in all major management decisions.
- *Strong CEO and ornamental board*. This model is increasingly common when CEO is also a founder of organization. Professional, talented, and charismatic CEO has a clear vision for the organization and takes over the responsibilities of the board and holds almost absolute power.
- *CEO and board as equal partners*. This model is present where the board and the CEO work as partners or colleagues to achieve common goals. This is the most ambiguous partnership between the CEO and the board, emphasizing flexibility and cooperation, but at the same time providing much opportunity for disagreement.
- *CEO and board as partners with clear boundaries*. In this model board is expected to define in clear terms everything the CEO is or is not allowed to do. There are clear explanations of the roles of CEO and the board. This model sacrifices flexibility for the sake of clarity.
- *CEO and board as servant leaders*. The term of servant leadership appeared in the early 1970s. This model emphasizes collaboration, trust, empathy, and the ethical use of power. It is focused on the opinion that people should first seek to serve for the common good. Both CEOs and board members should be focused on how best to help each other and the organization.

It is common for nonprofit organization also to hire professionals that help to sustain daily operational activities of nonprofit organization: an accountant, a professional fund raiser, a professional marketing specialist, a volunteer coordinator, an IT specialist, and other professionals that the organization needs for providing its services. Usually national or state laws allow a nonprofit organization to pay salaries to its employees. Competitive salaries depend on the cost of living in the area, the size of organization's budget, or the type of service the organization provides.

Nonprofit organizations also rely on the work of unpaid staff. This is the most complex and the least defined position in nonprofit organization. Such volunteering can assume a diversity of forms depending on the organization in which volunteering takes place, the management approach and degree of support volunteers receive, and the cultural and institutional context in which volunteering occurs. Recently, the role of volunteers is perceived in a broader sense involving aspects of leadership of activities, coaching, teaching, tutoring others, etc.

Literature reveals three major theoretical perspectives or paradigms that can be employed for explaining the role and functions of volunteers in contemporary nonprofit organization (Rochester et al. 2010):

- *The dominant paradigm*: This view of volunteerism embodies a traditional understanding

of volunteer work and what it means to be a volunteer. From this perspective, the work undertaken by volunteers is defined in advance by the volunteer-involving organizations. In this case, people are recruited for specific roles. This process may involve selection, induction, and training.

- *The civil society paradigm*: This view emphasizes that volunteers are not seen as helpers who are recruited to implement specific roles within the organization. On the contrary, it sees volunteers as members of the association who provide it with leadership and undertake all of its operational activities.
- *Volunteering as serious leisure paradigm*: The "classic" role for the leisure volunteer is as a performer, practitioner, or participant, but there is a range of other functions to be undertaken. These include coaching, teaching, or tutoring others; acting as directors, conductors, or managers; officiating at athletic matches and judging competitions; and carrying out administrative and support roles such as painting scenery, stewarding, and "front of house" duties.

## Understanding Management and Motivation Differences of Staff and Volunteers

This section discusses the similarities and differences regarding management and motivation of paid staff and volunteers in nonprofit organization.

Explanations about volunteering are rooted in questions about *who volunteer*s and *why people volunteer*. Just few theorists have positioned volunteering as nonwork and consequently placed volunteers as inferior to paid workers for such reasons as their lack of formal organizational commitment and accountability. This view is narrow and does not suit the context of contemporary societies as it this leads to the situations where volunteers, like other low-status workforces such as temporary workers, occupy a marginal position having little organizational voice or ability to influence organizational policies or practices. The major part of research, on the contrary, shows that many organizations put effort into attracting volunteers and use different techniques to manage them efficiently.

The majority of definitions of volunteers or volunteering involve some aspect of free and unpaid work or activity. Volunteering is often described as an activity that is freely chosen, does not involve remuneration, and helps or benefits strangers. It is generally considered that the principles of unpaid work and the absence of remuneration are central to defining the essence of volunteering. The absence of financial rewards, leads volunteers to be motivated by other types of stimulus to engage into voluntary activities. Volunteering is often perceived as a normative behavior, often implying the altruism as a core value that motivates volunteers (Shantz et al. 2014). It might be assumed that the volunteers are motivated by the intrinsic rewards of their work itself, the job content, recognition, and responsibilities to others.

However, some authors also highlight rational choice as a reason to be engaged in volunteering. Wilson (2000) describes volunteering as an activity where time and expertise are given freely to benefit another person, group, or organization and emphasizes that such a definition does not preclude volunteers from benefiting from their work. Benefits from voluntary work can be perceived in different ways. There is much debate whether these benefits can include material rewards; however, there is much evidence provided about the nonmaterial rewards for volunteers: pride, respect, visibility and prestige, belonging to the group, group identity, etc. Voluntary activities produce both tangible and intangible benefits not only for its beneficiaries but also for the volunteers. Thus, people volunteer for a complex mix of altruistic and self-interested reasons, and volunteers are both "givers" and "takers." This aspect reveals a "duality of volunteering" incorporating altruism and egoism (Hardill et al. 2007). Thus, management and motivation systems in nonprofit organization should include both tangible and intangible benefits for their volunteers and paid staff.

The same as with paid work, the volunteer work requires commitment of time and other resources (Drucker 2011). People often have paid jobs and often volunteer at their leisure time. For example, a volunteer firefighter has a paid job as an engineer and is engaged in voluntary activities after working hours. Therefore, some of the theories, such as the role overload theory, point out a negative relationship between paid work hours and volunteer hours.

The many research findings in the USA emphasize that people with higher social and economic status tend to volunteer more than those with lower social and economic status (Wilson 2000; Hustinx et al. 2010; Wilson and Musick 1997) implying that volunteers have financial resources for living from elsewhere, not from voluntary activities. Surplus allows people to share their financial wealth, time, and expertise. It is also shown that as the professional status of a person increases, the likelihood of volunteering increases as well (Ariza-Montes et al. 2015). Some empirical findings show a positive relation between voluntary work and employment when voluntary work is associated with training for the workplace (Hardill et al. 2007). Volunteering has been interpreted as a way to show that person is ready for paid work or as a means of career progression as experience in volunteering resembles paid work contexts in terms of development of skills such as leadership, commitment, abilities to schedule, communicate, and many others. Thus, although volunteering can enhance employability of some individuals in some contexts, the relationship between these two is not always confirmed.

Another challenging question is whether being an active member of a voluntary association is the same as being a volunteer. There is to differentiate these two types of activities, arguing that a member of voluntary association "consumes the collective goods" the organization provides while a volunteer helps to "produce those goods." As such, it is useful to separate *associational volunteers*, who are working *for* their organization, from *program volunteers*, who are working *on behalf* of their organization (Wilson 2000). However, the line between these two categories is very thin. Thus, others argue for categorizing volunteering as formal or informal. *Formal volunteering* is conducted within or through a group or organization, and *informal volunteering* is conducted outside of group structures, on an individual basis. Clear distinctions are becoming even more complex in contemporary societies that witness processes of globalization and information technology development. These processes lead to the changes in volunteer practices, with the prevalence of short-term *episodic* volunteering.

The process of globalization produced a new type of volunteering called *voluntourism* that implies a combination of volunteering and tourism. This type of volunteering involves traveling outside one's country to volunteer abroad and combines service work with travel to an exotic destination, either domestically or, more commonly, internationally (McAllum 2017).

The development of information and communication technologies has enabled a new form of volunteering that can be called *virtual volunteering*. It provides opportunities for individuals to assist nonprofit organization without being physically present. Nowadays, nonprofits around the world increasingly rely on virtual volunteering for such tasks as managing online website content, conducting online research, organizing online campaigns, etc.

## Conclusion

Traditionally, staff refers to all the people employed by a particular organization who receive a salary, while volunteers are understood to be those people who are engaged in an activity of their own free will, contributing to the public good without earning a salary or other financial rewards. However, volunteers and staff in nonprofit organization compared to for-profit organizations are both theorized to be more motivated by intrinsic rather than extrinsic values.

Staff, through official affiliation to the organization, usually has a more stable position. The most complex and the least defined position in nonprofit organization is the one that is occupied

by volunteers. Volunteering can assume the diversity of forms depending on the organization in which volunteering takes place, the management approach and degree of support volunteers receive, and the cultural and institutional context in which volunteering occurs. Management and motivation systems in nonprofit organization are thought to be different as compared to business organizations. A motivational system can be based on meaningfulness and clearly communicated impact of one's work as much as it is on performance indicators by emphasizing intangible work-related benefits, such as the provision of trainings, seminars, recognition, and acknowledgment of their activity.

Work life, demographic, and technological changes have contributed to the prevalence of episodic volunteering in western societies. Thus, the issue of sustainable volunteering is an important one as short-term or *episodic* volunteering becomes increasingly more common than long-term volunteering.

# Stakeholder Analysis and Wicked Problems

Jeanne W. Simon
Universidad de Concepción, Concepción, Chile

## Synonyms

Ill-structured problems; Messy problems; Type III problems

## Definition

A wicked problem is a public problem that persists over time and appears unsolvable. It presents important knowledge problems resulting in conflicts over the nature of the problem as well as the optimal solution. Wicked problems have the following characteristics: (1) are unpredictable because they are nested in complex webs of relations; (2) are ambiguous due to multiple cognitive frames; (3) involve a large number of stakeholders with conflicting interests; and (4) cross multiple policy jurisdictions.

Consequently, these problems are resistant to technocratic solutions, are difficult to manage, are addressed by short-term solutions that only partially address the problem, and the institutional framework is inadequate for collaboration and knowledge coproduction. The most common wicked problems are climate change, asylum seeking, obesity, and natural resource depletion.

A common strategy to address wicked problems is a multistakeholder platform (MSP) based in deliberative dialogue involving a diversity of stakeholders, identified according to both their interests (stakes) and cognitive frames, and uses deliberation to develop durable solutions. Since the traditional definition of stakeholder refers to a group of people, organized or unorganized, with relatively homogenous interests (stake) on a particular issue, stakeholder analysis should also consider cognitive differences of policy frames.

Deliberative dialogue is conceptualized as an interactive process in which the different stakeholders reflect and negotiate on their frames in order to develop a shared language and possibly understanding of the problem and the best paths to take. Minimally, scientific experts, policy makers, administrators, and specific interest groups should be included. Based on collaborative analysis, different strategies are developed, including public-private collaboration.

## Introduction

With the increasingly complex and intertwined nature of public issues, there is a growing recognition that top-down, state-centered policies are unable to effectively address the most complex problems, including environmental, health, and safety issues. Within policy science and management literature, Rittel and Webber (1973) first identified 10 principal characteristics that complicate the "taming" of wicked problems, including that there are no easy solutions, they are difficult to manage, multiple stakeholders are involved, and possible solutions tend to create other problems. Further, even when most stakeholders agree that the present state of affairs is problematic, they cannot agree on the nature of the problem or its possible solutions because their analysis is based on different theoretical perspectives. Since then, diverse authors have proposed and analyzed diverse strategies and structures to address them.

## Characteristics of Wicked Problems

A wicked problem is unpredictable since it consists in a dynamic web of relations that changes over time rather than a stable entity "waiting to be fixed" (van der Steen et al. 2013). Indeed, due to limited understanding of their nested nature, every solution to a wicked problem is considered to be symptom of another problem. Consequently, linear solutions are considered to be unsuitable because they will likely produce undesirable results since possible solutions create new problems even when they may solve some issues.

Secondly, wicked problems are messy because there is no single definition of the problem but rather different stakeholders define it from different perspectives. Ambiguity and uncertainty are common (Roberts 2000; Head 2008) due to expert disagreement over the nature and causes of the problem as well as the proposed solutions. Since different explicatory frameworks identify distinct problems and each one scientifically studies its causes within its framework, there are multiple methods to identify solutions but no manner to identify the best solution or determine which explicatory framework is "correct" (Schön and Rein 1994). Consequently, problem boundaries are not given but need to be probed and the different frames must enter into dialogue in order to develop shared understandings with all relevant stakeholders.

Thirdly, due to the complex, nested nature of wicked problems, virtually everyone has a "stake" in the proposed solution. These stakeholders not only have different interests but also different perspectives on the nature of the problem. Consequently, conventional stakeholder analysis needs to be modified to assure participation of the multiple theoretical frameworks in the definition of the problem and solutions. This process should also contribute to trust building and facilitate public-private governance.

A fourth characteristic is the multidimensional nature of a wicked problem. Consequently, its solution will involve multiple policy jurisdictions and require intersectorial collaboration. However, the absence of strong institutional frameworks results in complex and highly undetermined

types of interactions (Koppenjan and Klijn 2004), complicating the possibilities of collaboration. Consequently, thus requires leadership to facilitate the environment necessary for social learning and collaborative capacity building. Further, Dewulf (2013) characterizes wicked problems as governance problems that must consider uncertainty and equity in addition to institutions.

Roberts (2000) differentiates between authoritative, competitive, and collaborative strategies to address wicked problems and argues that a collaborative strategy is more effective when power is dispersed among multiple stakeholders but not contested. Due to the complexity of a wicked problem, no single stakeholder (including the state) has sufficient knowledge to effectively address the problem. Further, a stakeholder's understanding of the problem tends to be limited to his/her perspective, and any solution based on a single perspective will produce undesired consequences. Thirdly, various stakeholders see the issue differently, draw on different knowledge sources, and propose different ways to address it. Consequently, multistakeholder dialogues/platforms are commonly established (1) to define the problem, (2) identify partial, short-term solutions, and (3) ideally a multidimensional, shared understanding of the wicked problem (Brugué et al. 2015).

At the same time, several authors such as Roberts (2000) argue that the multiple differences between stakeholders tend to be more visible than the common areas between them, creating important challenges for constructive dialogue. Consequently, in the case of wicked problems, the creation and functioning of a multistakeholder platform present challenges for technical knowledge, stakeholder identification, and deliberative methodologies.

## Ambiguity and Frame Reflection

In contrast with problems that are clearly delineated, wicked problems are ambiguous because more than two equally plausible interpretation possibilities exist. These should be understood as grounded in competing explanatory frameworks rather than arising from gaps in scientific knowledge (Schön and Rein 1994). Since experts and stakeholders use conflicting theoretical frameworks, the only way to build mutual understanding of the wicked problem and establish common actions is to visualize, acknowledge, and debate these cognitive differences, which requires intellectual flexibility. Consequently, the active participation of experts in multistakeholder platforms (MSP) is crucial for joint learning and an informed negotiation process among different actors.

These different cognitive frames tend to be closely related to experts' paradigms and stakeholders' interests. Consequently, "Some or all the parties will have to revise, enlarge or reframe the way they relate to the issues and to each other, in order to support mutual understanding and common action" (Dewulf et al. 2005: 122). According to Schön and Rein (1994), the way to address frame conflicts is to construct through deliberative dialogue a metaframe that builds on the conflicting frames of reference deployed by key actors. Through the discussion, they learn about the problem as perceived by different stakeholders in a process defined as "cross-frame reflection" (Koppenjan and Klijn 2004; Rein and Schön 1993). At the same time, in early stages of the discussion, the existence of a certain level of ambiguity may favor the identification of shared concepts that facilitate communication and can form the base of future collaborative learning.

In this way, the deliberative dialogue can be conceptualized as an interactive process in which the different participants reflect and negotiate on their frames in order to develop a shared language, greater understanding of the different dimensions of the problem, and certain ideas on the possible paths to take. Stakeholder participation can reduce conflict intensity through trust building and repeated interaction between conflicting interests. The objectives of the deliberative dialogue are to arrive to decisions considered to be "fair and reasonable" and to achieve a "shared understanding" of the problem, favoring legitimacy through the cocreation of solutions.

## Stakeholder Selection for Frame Deliberation and Problem Definition

When establishing a deliberative dialogue to address a wicked problem, participation of

multiple types of stakeholders is required: scientific experts, public managers, policy bureaucrats, public and private practitioners, political authorities, and civil society organizations are brought together to analyze the problem and search for possible solutions. These actors are characterized by their different backgrounds (experiences), disciplines, paradigms, values, and interests that need to be identified before building a shared understanding.

Even when stakeholder analysis is common place in public policies and programs to assure inclusion and adequate interactions with both public and private actors, the "taming" of wicked problems additionally requires constructive dialogue on interests, values, and cognitive frames, and consequently a distinctive approach should be used to identify participants in a multistakeholder platform.

Early literature on stakeholders is found in business ethics, where corporations have legal obligations to stockholders as well as moral obligations to stakeholders who are nonstockholders that can be negatively affected by the corporation actions. The term "stakeholder" refers to a group of people, organized or unorganized, with relatively homogenous interests (or stake) on a particular issue. Based in cost-benefit analysis and bounded rationality, each stakeholder (individual or group) is assumed to possess different capacities (resources) to protect their collective interests and to influence other actors' decisions. Thus, prior to the implementation of an important project, stakeholder analysis can be used to anticipate possible points of opposition or conflict, and in this way design (or negotiate) a plan that creates a win-win situation for all affected parties. In this way, stakeholder analysis forms part of strategic management in both the public and private sectors because any group affected by a project will eventually acquire the capacity to affect it, including actors in opposition (Freeman 1984).

In general, it is not necessary to include stakeholders with little interest in the issue and little power to support/oppose the solution. However, the public sector also uses stakeholder analysis to identify groups that will be affected but not the recourses needed to affect the final decision. Still, even when stakeholder analysis is inclusive, it is not necessarily democratic and participation is principally defined according to the program's goals. For example, Bryson (2004) presents a series of methods to identify the stakeholders to be included. The first technique is to perform a preliminary analysis identifying the power (resources) and interests of each stakeholder. These stakeholders should be invited to a first meeting where the principal objective is to identify the stakeholders that should be involved in future discussions, considering the advantages (e.g., is their support essential for success?) and disadvantages (e.g., will they try to dominate the discussion?) of including each stakeholder. For Bryson, the stakeholder identification process should be designed to gain needed information, build political acceptance, and address some important questions about legitimacy, representation, and credibility.

With increased conflict and greater governmental use of participatory strategies, stakeholder analysis is increasingly used in public-private relations. In the case of wicked problems, whose boundaries tend to be diffuse, the identification of stakeholders becomes a key element in the development of a solution. In most stakeholder analysis, the first characterization is according to type of actor (e.g., governmental, business, civil society, expert) because different types of actors are assumed to have different strategic interests.

However, in the case of wicked problems, there will be important differences in cognitive frames among actors of the same type even when they share the same interests. Further, they may even have different knowledge on the issue because they come from different organizations, administrative levels, and networks. At the same time, Cuppens (2010) recommends the inclusion of marginal perspectives in order to challenge invisible assumptions and trigger collective learning processes. The first step is to identify the different perspectives and select stakeholders to assure an adequate representation of the different perspectives. Consequently, for wicked problems, inclusion of a stakeholder should not be limited to their interest in the issue but should also be based on their relevant expertise/understanding based in

scientific studies or practitioner knowledge. Indeed, the principal question determining inclusion is: Who has relevant expertise and is willing to contribute to the discussion?

In this way, the preliminary characterization of stakeholders should be complemented by the participatory technique "problem-frame stakeholder maps" to identify the principal values, paradigms, and knowledge used by the most powerful and interested actors. The list can then be expanded by using a snowball sampling technique. Still, even with adequate stakeholder identification, there will be a series of complications since wicked problems will involve both negotiation and deliberation and take place in an inadequate institutional context characterized by low levels of interpersonal trust.

### Deliberative Dialogue

The role of deliberation is to arrive at decisions that participants believe fair and reasonable. It has the characteristics of communicatively rational deliberation based on the assumption that although it is not possible for all claims to be satisfied, it is possible for people's views "to be swayed by rational arguments and to lay aside particular interests and opinions in deference to overall fairness and the common interest of the collectivity" (Miller 1993: 76). In the design of the deliberative process, important efforts need to establish agreements over procedures to assure a respectful environment when stakeholders enter into conflict over issues that are discussed.

Since deliberative dialogue for a wicked problem is defined as a process of learning together, in addition to science-based knowledge, practice-based cognitive frames and knowledge (closely connected to identity and experiences) also need to be recognized on equal terms and integrated into a network understanding. Effective facilitation between diverse cognitive frames and types of knowledge is complex and must involve knowledge sharing. Cuppen (2010) argues that stakeholder dialogue can benefit from diversity through constructive conflict. To encourage new ways of thinking about solutions, the participants are invited to reflect on the policy processes and on possible values and assumptions that could be causing the stagnating patterns; at times, new actors, new rules, or even new contexts need to be introduced (Termeer and Kessner 2007).

Since distrust is common in wicked problems, discussion of many issues is often used to make claims and/or blame others. Due to these levels of conflict, successful deliberation requires trust in the process (Roberts 2000), where decision rules are crucial. Further, equal participation in debates on cognitive frames needs to be assured. Since participation is generally voluntary, the activities should be meaningful. Communication increases the likelihood of engaging in problem-solving behavior and identifying win-win solutions (Head and Alford 2015).

According to Faysse (2006: 220), an enabling environment for a successful MSP requires "well-organized stake-holder groups, few power imbalances, and a State that fully supports MSPs and their outcomes." In contrast, unfavorable conditions include high social inequity, a state that does not support the MSP process and decisions, and unrepresentative stakeholder groups (Warner 2006).

Stakeholders must also trust the facilitator (manager) as a collaborative-capacity builder who works to create trust-based relationships (Weber and Khademian 2008a, b). The facilitator's role in a deliberative dialogue needs to be highly flexible, reflexive, and adaptive with a capacity to coevolve in relationship to participants' needs and understandings (Roberts 2000). Authors like Termeer et al. (2015) emphasize the importance of four network governance capabilities: reflexivity, resilience, responsiveness, and revitalization. Also, complementing the majority of the literature that concentrates on "acting," Termeer et al. (2015) also analyze two additional dimensions: observing and enabling. In this way, a network governance structure may emerge from the dialogue platform. Weber and Khademian (2008b) argue that network governance is more effective than market or hierarchy solutions, reflecting Roberts (2000) earlier conclusion.

## Conclusion

As can be seen, wicked problems involve complex conflicts over its conceptualization as well as

interests. Perhaps, the principal challenge is recognizing the ambiguous nature and the need to develop a shared understanding of the wicked problem before advancing towards solution definition. Consequently, technical experts need to reflexively analyze their understandings in order to participate in deliberate debates that are informed by both scientific and practical knowledge.

A first step in addressing wicked problems is the creation of a multistakeholder dialogue that will serve as a platform for future network governance. Considering low trust levels and inadequate institutional frameworks, the design of the deliberative process needs to contemplate strategies to strengthen participating organizations, balance power and knowledge differences, and encourage political commitment to the process and conclusions. Solutions should contemplate institutional frameworks that favor intersectorial collaboration and governance structures.

# Stakeholder Perspective in Nonprofit Organizations

Lisa A. Dicke, Abbey Heffner and Patrick Ratliff
University of North Texas, Denton, TX, USA

## Synonyms

Allies; Collaborators; Partners

## Definition

Nonprofit stakeholders include individuals, groups, communities, governments, and others,

that affect, or are affected by, one or more nonprofit organizations or the sector as a whole.

## Introduction

In the diverse nonprofit sector, it is difficult to generalize about its organizations, characteristics, and the perspective of its stakeholders. Nonprofit stakeholders include individuals, groups, communities, governments, and others, that affect, or are affected by, one or more nonprofit organizations or the sector as a whole. Thus, stakeholder perspectives reflect a myriad of interests. By definition, nonprofit stakeholders are affected by, or affect, the activities conducted in the nonprofit sector. Most nonprofit stakeholders are vitally concerned about the mission of a nonprofit organization and in influencing its success.

## Nonprofit Organizations

Nonprofit organizations in the United States are primarily mission-driven, private sector organizations that exist to serve both public and private interests. Influential universities and hospitals may be legally organized as a nonprofit to serve local or regional communities, or their service reach may extend to entire nations that are far-flung across the globe. Small grassroots associations may serve the interests of only a few members or enthusiasts. Religious and faith-based organizations occupy a large segment of the nonprofit sector in the United States and internationally. These organizations serve the spiritual interests of members but, through their efforts across widespread policy arenas including humanitarian aid, education, and health, have had profound effects. International and relief organizations are nonprofits that operate around the world. Although many US relief organizations may engage in domestic programming, "the bulk of their work is carried out overseas, in poor or war-torn countries" (Stoddard 2016, p. 401). In these instances, stakeholders include a diversity of entities including governments, national or subnational authorities, military officials, influential residents or dignitaries, displaced parties, and local residents and organizations. The knowledge, skills, and abilities required to negotiate, partner, and collaborate with sets of multiple stakeholders require attention to existing institutions, cultures, and, above all, the ability to understand the needs of others in order to serve and provide services with care and respect.

Theories suggest that the more heterogeneous the culture, the larger and more diverse the scope of the nonprofit sector. The complexity and size of the nonprofit sector and the degree to which nonprofit missions vary create difficulties in generalizing about specific variations in stakeholder perspectives. One definitional distinction that has been made with regard to the nonprofit sector is useful for articulating some generalities, however. These distinctions include (1) nonprofits do not distribute profits to stakeholders, (2) they exist without simple and clear lines of ownership and accountability, and (3) they do not coerce participation (Frumkin 2002, p. 3). Taking up each of these points is instructive in considering nonprofit stakeholder perspectives.

To understand the first point, a comparison with for-profit businesses may be useful. Freeman and Reed (1983) and Freeman (1984), for example, note that stakeholders are groups upon whose support a business depends. In business, a manager is called upon to satisfy the needs of various constituents to be successful. Among these constituents are owners and stockholders who invest time and resources, suppliers of materials for production or transport, and customers who purchase the products and services produced. Thus, *stockholders* are one principal upon which a business organization depends for investment and financial support, but they exist "among a host of varied principals or *stakeholders*" (Abzug and Webb 1999, p. 419). In the for-profit world, a customer is necessary for a business if it hopes to generate a profit. Thus the customer becomes a significant primary stakeholder upon whose satisfaction the business is dependent for survival.

For nonprofits, whose missions are not primarily for profit, the composition, roles, and obligations of stakeholders extend well beyond

those who supply parts or purchase services or products. In many cases, the client of a nonprofit organization has no ability to pay. And donor stakeholders or those making financial investments are not directly benefitted through profit sharing. Nonprofit stakeholders include those individuals and groups who affect or are affected by the nonprofit organization. Although nonprofits must be fiscally sound to remain viable, they are barred from distributing profits to stakeholders in the same ways that businesses do.

A second precept of nonprofit organizations is that they exist without simple and clear lines of ownership and accountability (Frumkin 2002, p. 3). Although boards of directors and trustees have legal responsibilities and obligations, they are not owners. Nonetheless, as with all organizations, nonprofits require leadership, resources, and managerial acumen in order to carry out their stated missions. A board of directors will certainly have considerable influence on the mission and direction of a nonprofit, and in so doing, they are not only an important stakeholder, but indeed, by their actions, they create stakeholders. Boards hire and fire nonprofit executives, recruit volunteers, provide linkages to the outside environment, and seek partnerships. The policy direction of a board of directors can create both friends and foes. Policies that promote environmental advocacy, for example, may attract new, like-minded members to an organization. At the same time, such advocacy may threaten the interests of entrenched industries willing to fight new regulations or turf battles.

Stakeholders of nonprofits include both internal and external actors including volunteer board members, paid staff, program directors and volunteers, congregants, and association members. Broad communities and governments are also stakeholders as are clients and the families of those served. Partnering organizations, suppliers, or businesses may also be considered stakeholders. Given the vast collection of nonprofit stakeholders, upholding expectations can be difficult as the goals of various stakeholders may be similar or at cross-purposes. Although most stakeholders have a direct interest in the success of a nonprofit, some stakeholders may be adversarial or inclined to eradicate a nonprofit's efforts. It is up to each nonprofit organization or association to recognize their stakeholders and respond to their needs and inquiries appropriately. Based upon the analyses of the needs and perspectives of their stakeholders, the responsibilities and obligations of a nonprofit will then take shape. Nonprofit stakeholders and some challenges and benefits in managing relationships among them are topics that are discussed shortly.

Finally, a third distinction regarding nonprofits is that they lack the ability to coerce participation (Frumkin 2002, p. 3). Here, they are differentiated from governments which may levy taxes or require fees or other payments to ensure that sufficient revenues are generated to carry out their purposes. The lack of the ability to coerce participation means that nonprofits are highly dependent upon their success in attracting members, volunteers, and donors to their causes. The sector relies heavily on public trust. In recent years, stakeholders have become increasingly demanding with regard to transparency and the documentation of mission-related outcomes. Nonprofits have become much more adept in providing stakeholders with this needed information. The result has been a strong effort to provide data that can be used to show positive results to help cultivate new stakeholders and promote trust among current supporters.

## Classifying Stakeholders

In contrast to private businesses, nonprofit organizations lack a narrow group of owners or investors to whom they are expected to benefit. Instead, nonprofit organizations face a long list of potential stakeholders who are interested in the success of the organization to varying degrees. Stakeholders with conflicting interests or degrees of involvement can lead to organizational confusion and difficulty in making decisions. Thus, nonprofit organizations must develop a way to classify and prioritize the perspectives of stakeholders to make decisions that serve both the mission and the interests of their stakeholders.

One means of classifying stakeholder groups arranges them based on their similarities rather than focusing on their differences. However, the nuances of dealing with many stakeholder groups have given rise to many approaches of stakeholder classification. One widespread approach involves differentiating groups as internal and external stakeholders, with interface stakeholders as an occasional third category (Van Puyvelde et al. 2012, p. 434).

Internal stakeholders function within an organization and are connected to its inner workings. These stakeholder groups provide the manpower and resources an organization needs to achieve its mission. They directly influence the success of an organization and hold a vested interest in the outputs and outcomes of the organization because of their contributions. The main internal stakeholder groups include managers, employees, volunteers, and, in some classifications, funders.

External stakeholders do not work directly within an organization but collaborate or interact with it. These stakeholders are beneficiaries in some way of the work the organization does. They are affected by the behavior of the organization and depend on its success. Examples include clients, collaborative organizations, government entities, and community groups.

While many stakeholders of a nonprofit fit neatly into the category of internal and external stakeholders, such a binary categorization system does not allow for much distinction when considering so many groups. Another category that is sometimes included is interface stakeholders (Van Puyvelde et al. 2012, p. 434). The functions of interface stakeholders resemble those of both internal and external stakeholders. This term may be used to describe the board of directors – a group that represents an organization, is privileged to organizational information, and sets the organization's direction. Yet, a board of directors also functions as a governing body, providing oversight for the organization, which requires a critical, unbiased approach. Additionally, a board of directors serves as an intermediary between the nonprofit organization and the public.

## Nonprofit Organizations' Obligations to Stakeholder Perspectives

Nonprofit organizations prioritize their obligations to stakeholders in order to be efficient with limited resources. Some obligations apply to all stakeholder groups, such as pursuing the mission efficiently, acting ethically, communicating information, and considering an array of perspectives in decision-making. Some obligations apply to narrowly defined groups, such as the financial reporting obligations to stakeholders who donate resources or oversee their financial activities.

All nonprofit organizations have an obligation to its stakeholder groups to pursue its mission efficiently and effectively. Clients, the community, and government entities depend on nonprofits to address the needs for which they were created. Nonprofits with related missions depend on competent partners to work effectively alongside them. Nonprofit organizations enjoy tax benefits, and government entities expect these organizations to carry out activities that are consistent with their stated purposes. Foundations, businesses, individual donors, and volunteers give money, in-kind donations, and time with the expectation that those resources will be used wisely. Further, the organization's employees, management, and board of directors, due to their positions, are committed to work toward that same mission. In accepting contributions of time, money, effort, and support, a nonprofit organization has the responsibility to utilize contributions for the stated purposes of their mission.

Much like the obligation to pursue the organization's mission, nonprofit organizations also have an obligation to operate ethically. Unethical behavior hurts stakeholder groups. It harms an organization's reputation, reduces incoming funds and resources, taints partnerships, and reflects badly on the image of the nonprofit sector as a whole. When donations or grant funding is used dishonestly, clients are at risk of losing services and nonprofit employees are at risk of losing their jobs. From a broader perspective, allegations of unethical behavior hurt all nonprofit stakeholders as the sector relies on public trust to exist.

Stakeholders have a right to be informed, although not all stakeholder groups require the same type of information or level of detail. Communicating with stakeholders can be time-intensive and costly. Organizational staff must compile information, assemble it in understandable and appropriate formats, and distribute it accordingly. Funders have a right to an accounting of how their funds are being used. It is a waste of time and resources to distribute every bit of information to every stakeholder, however. Program managers, for example, may need information about the availability of supplies or the number of volunteer hours necessary to get a job done, but a funder not need be concerned with such operational information. A client of a nonprofit preschool does not need information about delivery schedules but needs information about the quality of care provided to children and policies to protect their safety.

Volunteers are stakeholders who need to know that their contributions are valued in order to stay motivated to serve. A board of directors has access to sensitive information including financial and fundraising data, strategic plans, and reports that identify threats to the organization. The board's role in providing oversight and direction necessitates that such information be available.

External stakeholders, including clients and community groups, need to know the mission of an organization, what services are offered, when, and to whom. This information needs to be readily accessible to potential clients to best serve the organization's target population. General financial information should be publically available on annual tax documents, on websites, and in annual reports to maintain transparency and public accountability. Collaborative organizations need to be well informed in order to make decisions about partnerships with other nonprofit organizations. How well a nonprofit responds to the information needs of each of these stakeholder groups depends on their resolve and their capacity to do so. Government entities are one exception to an information divide as they can require thorough information to be provided in order to ensure legal and regulatory compliance.

The perspectives of all stakeholders should be considered in decision-making, but not all will carry the same weight. Without some means of prioritizing the input of stakeholders, the organization courts chaos and gridlock as each stakeholder group competes for influence. Generally, internal stakeholders are more actively involved in providing input into the day-to-day decision-making that occurs than are external stakeholders. Because the board of directors sets policy and long-term direction and is responsible for authorizing significant fiscal decisions, the perspectives of this group are crucial in nonprofit decision-making. Board members are seated based upon their expertise in finance, law, fundraising, or other considerations and all contribute in decision-making. They serve as the interface for their organization and provide a channel through which multiple perspectives become known. Employees, likewise, interact with clients and observe the reception and effects of an organization's services. They also receive input and feedback as they interact with clients and other members of a community.

Front-line employees and managers occupy different positions in the organization and each may hold a unique perspective regarding organizational functions and their efficiency or effectiveness. Volunteers, likewise, are situated to offer opinions. Another sometimes internal stakeholder group, funders, exercises their perspectives when they decide whether to donate, either to the organization in general or in support of a specific campaign.

External stakeholders including clients provide feedback about what the organization does and whether it is helpful to them or not. Community demographic changes and other nonprofits may reflect shifting needs more quickly than a single organization may recognize on its own. Thus, knowledge and shared information are crucial for establishing conditions favorable to buy-in from both internal and external stakeholders. Funders are more likely to give or invest when they feel that their perspectives, as well as those of the community, have been taken into consideration. By being open to the perspectives of stakeholders, nonprofit organizations can ensure that

they maintain adequate resources to offer appropriate and effective services.

Some nonprofit obligations are specific to singular stakeholder groups. For example, a nonprofit organization may have a contract to deliver services on behalf of a government entity. Financial support is provided with the understanding that it will be used to further both the government's program goals and a nonprofit's organizational mission. Government entities offer tax incentives and other benefits to nonprofits based on their missions, thereby foregoing revenues that would otherwise be collected. In turn, nonprofit organizations have the responsibility to meet the conditions for which the tax benefits are provided and for upholding the stipulations in legal contracts.

## Stakeholders' Obligations to Nonprofit Organizations

The obligations of nonprofit organizations to its stakeholders are not one sided. A nonprofit cannot be expected to be omniscient and most are not self-sufficient. Nonprofit organizations must identify stakeholders' perspectives to acquire resources. Some stakeholder obligations apply to all stakeholder groups, but others vary based on the nature of the relationship and the characteristics of the stakeholder group. Stakeholder groups with specific obligations to uphold include boards of directors, nonprofit employees and management, and volunteers and members.

Obligations that apply to all stakeholders include behaving prudently and ethically in decision-making. The public perception of nonprofits, both in general and specific to each organization, is sensitive. If a nonprofit organization is perceived to be unethical, its reputation will suffer, followed by diminished donations and a limited capacity for pursuing its mission. A collaborating stakeholder's ethical reputation is tied to the apron of its nonprofit partners. Unethical behavior by employees, volunteers, donors, board members, and even clients has the potential to tarnish the reputation of all related nonprofit organizations.

A board of directors has significant obligations to the nonprofit organization it represents. This group does not simply serve as another tier of management but exists to provide oversight and support for the nonprofit. Each board of directors may have distinctive job descriptions, but there are consistent obligations and responsibilities to be upheld across all boards. First, a board is responsible for establishing a direction for the organization and ensuring that activities ultimately center on the mission. Second, a board ensures that the nonprofit has the necessary resources to fulfill the mission by raising funds and appointing an appropriate executive director. Third, they protect the organization by providing oversight and accountability and ensuring ethical and legal guidelines are followed. Finally, they advocate for the organization and its mission by utilizing connections within the community and representing the organization to the outside world.

Internal stakeholders, including managers, employees, and volunteers, observe the inner workings of an organization from a unique vantage point. These internal stakeholder groups have an obligation to communicate with the organization's leaders to provide opportunities for organizational improvement. This obligation requires each stakeholder group to take ownership of organizational processes and success.

Although the optional nature of volunteering indicates that this group of stakeholders does not have any inherent obligations, the act of volunteering actually establishes a social contract upon which the nonprofit depends. Volunteers extend an organization's capacity and are valuable resources and representatives. Once volunteers commit to serve a nonprofit in a particular way, they have an obligation to follow through with their commitment. Although, these obligations are self-determined, they are implied obligations nonetheless.

It is clear that nonprofit organizations have obligations to their stakeholders and each may present its own set of unique challenges. Yet nonprofit organizations that choose to include their stakeholders in decision-making and other activities enjoy many benefits from enfolding these perspectives.

## Challenges and Benefits in Stakeholder Involvement

Involving stakeholder perspectives in decision-making is a time- and resource-intensive process. A system is needed to engage stakeholders and assess their needs. Feedback should be both forward-thinking and responsive.

Working with external stakeholders, such as service recipients, funders, and partner organizations, often has competing goals, interests, and ideas of what a nonprofit organization should be doing. This dynamic leads to nonprofit managers having more ambiguous and diverse goals than their for-profit counterparts. Involving external stakeholders in activities, decision-making and information flows require dedicated resources. Nonprofits have become increasingly savvy in using websites, Twitter, Facebook, Instagram, and mobile features to obtain and share information, but each platform requires the capabilities to manage and to keep the information fresh and timely for stakeholders (Ott and Dicke 2016, p. 190).

The perspectives of funders and donors can also create sets of challenges for nonprofit organizations. Individuals and foundations have specific purposes for which their donations or grants may be used. Restricted funds are welcome, but they limit the purposes for which the funds can be used. Although some foundations invest in capacity-building expenses, more often, funders seek to fund visible programs and brick-and-mortar projects. How to cover overhead expenses and other associated costs of doing business is left for the nonprofit manager to figure out.

Today, transparency with stakeholders means that information is electronically available. Outside organizations that exist to rate the administrative efficiencies of nonprofits (e.g., CharityWatch and Charity Navigator) provide charitable donors with easy access to online information. Thus, funders, donors, and other stakeholders with financial interests are able to use multiple means of gathering information to discern fiscal prudency.

Ultimately, nonprofit organizations cannot expect to satisfy each individual stakeholder

| Challenges and bene fits of stakeholder involvement, by type of stakeholder | |

**Stakeholder Perspective in Nonprofit Organizations, Fig. 1** Challenges and benefits of stakeholder involvement

affected by its work. Nonetheless, attempts to understand the needs and perspectives of stakeholders are wise practice. The main challenges associated with involving both internal and external stakeholders can be summarized as follows: identifying the various groups of stakeholders, learning about their needs, assessing the level of involvement each stakeholder group desires, prioritizing communications, determining the best methods of information flows, and deciding what resources to dedicate to stakeholder inclusion.

The benefits of involving internal stakeholders in decision-making include improved services, goal consensus, and organizational buy-in. Research on stakeholder theory confirms the benefits of communicating with stakeholders to ease change management challenges and improved overall organizational satisfaction (Haggroth 2013; Robertson and Choi 2012; Thomson and Perry 2006).

Involving external stakeholders offers other benefits. First, by including external groups in decision-making, the credibility, legitimacy, and trustworthiness of an organization are enhanced. The more transparent and inclusive the organization is, the more credibility it builds with stakeholders. Involving external stakeholders also maximizes an organization's opportunity for resource development. Because donors and funders account for a large segment of external stakeholders, including them in decision-making increases the likelihood that they will provide the organization with funding and other resources. A summary of the challenges and benefits of stakeholder involvement is provided in Fig. 1.

## Conclusion

As we have discussed, the variety of stakeholder perspectives for nonprofit organizations varies widely. Multiple stakeholders affect and are affected by the decisions made by the collections of organizations in the nonprofit sector. The reach of the nonprofit sector is growing. Although this chapter has dealt with organizations in the United States, the work of nongovernmental organizations is not confined to any country or region of the world. The impact of the work of nonprofits is truly a global phenomenon.

Finding ways to include stakeholder perspectives is challenging but is necessary for the benefit and the survival of most nonprofits. Without clear lines of ownership and accountability, the obligations of nonprofits are diffuse and obligations are not always backed by the force of law. Nonprofits cannot coerce participation and they are reliant on the public trust to attract members, participation, support, and financial commitment. Thus, there are incentives for nonprofits to be cognizant and respectful toward the needs and perspectives of stakeholders. Indeed, the nonprofit that ignores stakeholders' perspectives does so at considerable risk to itself and to the sector as a whole.

# Stakeholder-Centric Exploration of Health Insurance Subscription

Vincent Ekow Arkorful
Department of Government and International Studies, Hong Kong Baptist University, Kowloon Tong, Hong Kong, China

## Synonyms

Health insurance policy; Push and pull factors of insurance policy subscription; Social policy intervention; Theory of planned behavior

## Definition

Health insurance policy refers to a safety policy intervention measure devised to provide individuals and households from unexpected catastrophic health expenditures.

## Introduction

Given the global commitment to improving healthcare and well-being for all people regardless of race, religion, income, and geographical location (Kizito et al. 2012), issues of healthcare have in recent times become not only a sensitive but also an all-consuming discourse that has preoccupied the attention of stakeholders across both government and nongovernment divides. Essentially, healthcare is acknowledged as a conduit for advancing human development (Ferrer et al. 2005; Arkorful et al. 2018). At the heart of the global effort to advancing healthcare while tackling the nagging issue of inequality (a phenomenon that has perennially dealt debilitating impact on healthcare deliver) remains the pursuit to reduce to the barest minimum level incidence of treatable illness – to enhance freedom (Sen 1999) and at the same time ensure an extensive distribution of healthcare benefits.

It is therefore instructive to stress that equitable population-wide healthcare access constitutes a basic principle for the global health system. For this reason, the failure or inability of any healthcare structure to guarantee these benefits is likely to entrench inequalities and disparities (Weissmann et al. 1992). As much as equitable healthcare remains a global priority, the realization of the same is however a challenge, more particularly for governments in developing countries (Sulemana and Dinye 2014). Under this situation, it becomes worrying that health-related Sustainable Development Goals (SDGs) may not be achieved because of the potential difficulty that this hurdle may pose for vulnerable populations.

The hurdles confronting the capacity of governments to provide healthcare have largely been one embedded in policy lapses and deficiencies. Because this has been the situation, against the backdrop of health insurance efficacy to providing antidote to healthcare, delivery, and access, it has ended up as a tool deployed to countervail health-related uncertainties. Globally, health insurance has mainly and largely been incepted in binary folds, thus, private and public/government (Gruber and Simon 2008). Various countries around the world have adopted and are still operating various forms of health insurance schemes targeted at expanding and increasing healthcare access (Alhassan et al. 2016). The outcomes and impacts of these various schemes have been heterogeneous. Whereas health insurance schemes, after years of introduction in some countries, have witnessed substantial improvements in subscription, the same could not be said for others (Blanchet et al. 2012). Dalinjong and Laar (2012) recount the successful story of the health insurance scheme in Australia and Canada. Escobar et al. (2009) and Hsiao and Cheng (2013) also confirm the progress of the health insurance scheme in Colombia and Taiwan, respectively. However, some African countries who have successfully implemented similar schemes have recorded chequered experiences (Arin and Hongoro 2013; Kumi-Kyereme et al. 2017; Uzochukwu et al. 2015; Abuya et al. 2015; Dutta 2015).

The situation is not different in Ghana where the National Health Insurance Scheme (NHIS) has over the years witnessed a concatenation of challenges such as claim processing delays, and negative service providers' attitude, among others (Arkorful et al. 2018). As part of measures to countervail these challenges and render the policy effective, the National Health Insurance Authority (NHIA) (the body responsible for the regulation of the health insurance scheme), in concert with stakeholders like the Ministry of Health (MOH) and Ghana Health Service (GHS), among others, has instituted appropriate mechanisms comprising the introduction of a free maternal care service, biometric card issuance, claim processing and customer call center inauguration, etc.

Nonetheless, though the scheme covers about 95% of disease burden, scheme coverage stands at an unimpressive 38% (Amu and Dickson 2016; Amu et al. 2018). This sets Ghana far from the 80% + Sustainable Development Goal-related Universal Health Coverage target (Amu and Dickson 2016). Furthermore, though the insurance scheme is implemented to ease financial burden on vulnerable populations, reports of scheme inefficiencies abound (Mensah 2012; Kumi-Kyereme and Amo-Adjei 2013; Amu and Dickson 2016; Arkorful et al. 2018). In view of the pertinence of health insurance, vis-à-vis a rising global disease burden, healthcare research has gained an enormous prominence. Field-related studies employing varying approaches in diverse study settings have reported various significant and interesting findings.

Specifically, whereas some studies have essentially focused on subscribers, scheme managers, and service providers (Kumi-Kyereme and Amo-Adjei 2013; Amu and Dickson 2016; Arkorful et al. 2018), others have been conducted at the country level (Arin and Hongoro 2013; Kumi-Kyereme et al. 2013; Kiplagat et al. 2013; Muiya and Kamau 2013; Dutta 2015; Carapinha et al. 2011). These studies have largely been quantitative and stakeholder-specific in focus, to the neglect of non-subscribers. A juxtaposition of these against the general prior study findings underscoring policy challenges makes it obvious that investigating subscription intention across the various stakeholder divides would be desirable for ensuring policy coverage and efficacy, as this would help forge an appreciable comprehension of factors underpinning health insurance subscription.

On this basis, the study sets out to investigate "push" and "pull" factors regarding individual health insurance subscription intention. Findings generated from this study would help provide relevant pointers to policy makers and stakeholders. The remaining part of the paper is organized as follows: "Conceptual Framework: Theory and Literature" segment illuminates on theory and relevant study literature. "Materials and Methodology" part discourses on the research methodology. "Results" section covers the study results. Study discussion is captured in the "Discussion" part. The final part covers the conclusion, recommendation, and implications for policy, practice, and further research.

## Conceptual Framework, Theory, and Literature

The theory of planned behavior (TPB), a product of the theory of reasoned action (TRA) proposed by Ajzen (1991), was employed for the study. The TPB is one of the theories widely employed to probe human behavior. The theory is principally hinged on attitude, subjective norm, perceived behavior control, and intention. The TPB converges around the supposition that the performance of behavior does not occur in a vacuum but rather based on planned and deliberative factors driven and/or influenced by internal and external factors. Against this backdrop, the study conceptualizes health insurance policy subscription as behavior-based, and as such within the mold of the TPB (Ajzen 1991; Baker and White 2010) (Figs. 1 and 2).

With regard to the TPB theory, attitude represents the individual's negative or positive assessment or feelings to perform behavior. According to Martin et al. (2010), attitude comprises a set of beliefs and their evaluation and/or judgment, which could yield either a positive or negative outcome. To confirm the significance of attitude

**Stakeholder-Centric Exploration of Health Insurance Subscription, Fig. 1** Conceptual model of the theory of planned behavior (Ajzen 1991)

**Stakeholder-Centric Exploration of Health Insurance Subscription, Fig. 2** Conceptual framework

in predicting behavior intention, Ajzen (1991) avers that a stronger and positive attitude informs a stronger intention to perform behavior. Therefore, in generalizing this logic within the study context, it could be posited that the tendency to perform subscription behavior could either be militated against or facilitated by a strong attitude.

Subjective norm on the other hand refers to the individual's perceived social pressure or expectation to perform a behavior (Stone et al. 2010), which in this study is health insurance subscription. The pressure on the individual to perform behavior stems from expectations from important referent groups or individuals (Ajzen 1991; Cameron 2010; Stone et al. 2010). In this instance, the weight of recognition, value, and regard that an individual assigns to a referent group is likely to exert a bandwagon effect on the individual behavior performance (i.e., health insurance subscription behavior). On this note, the study puts forward that a stronger subjective norm is likely to have a contagious imitative effect on the performance of the same behavior.

Further, perceived behavior control refers to the individual capability, precisely, the perceived ease or difficulty to perform behavior (Ajzen 1991). Within the study context, behavior control is conceptualized as the individual control or otherwise over health insurance subscription – which is determined by factors which may be

internal and external to the individual (Ajzen 1991). This is such that the greater the individual control considerations, the more likely the tendency to perform behavior (i.e., health insurance subscription). To this end, the study concludes that certainty about individual control over behavior is likely to culminate in health insurance subscription.

Within TPB-related studies, efforts to strengthen the predictive potency of the model have informed the integration of variables like personal moral and descriptive norm (Manning 2009; Wang et al. 2016; Gao et al. 2017). Personal moral norm has been conceptualized as the responsibility to perform behavior based on individual's principle, responsibility, and obligation (Beck and Ajzen 1991). The study therefore presumes that individual personal resolve premised on certain internalized principles could substantially enhance the performance of behavior including health insurance subscription.

Descriptive norm refers to the individual's tendency to perform behavior under a given circumstance, depending on the prior or present behavior of the majority (Graham-Rowe et al. 2015; Jun and Arendt 2016). The significance of descriptive norm, relative to behavior performance, is underscored by Greaves et al. (2013) and De Leeuw et al. (2015). In realizing the study objective of health insurance subscription, the study goes beyond variable replication and posits that, while people with greater descriptive norm are likely to form subscription intention, the converse equally holds valid. Descriptive norm and subjective norm are classified as social norm. Nonetheless, they significantly vary in the sense that whereas the former represents the individual's perception about what important people in his or her life expect him/her to do, the latter captures the behavior performance of the referent group of important and what they have done, for which reason the individual feels obliged to correspondingly mimic. The foregoing discourse underlines the influence of a referent group on the behavior performance of others. The study anticipates both descriptive and moral norms to significantly inform individual health insurance subscription intention.

## Health Insurance Models in Other Jurisdictions

The attainment of Universal Health Coverage (UHC) goal (a cardinal component of UN-spearheaded SDG) has in recent times become the preoccupation of national policy pursuits across the world. Among other things, the goal is to ensure a wider population access to preventive, promotive, rehabilitative, curative, and palliative health services without financial challenges (Kieny and Evans 2013). The World Health Organization (2014) conceptualizes UHC as *"... where populations access health services without financial difficulties."* UHC is targeted at promoting the enjoyment of health rights, which are regarded as basic and inalienable to all people regardless of class, race, religion, political inclinations, or any social stratification benchmark (WHO 1948, 1978). The impetus for the extension of healthcare to populations and the realization of UHC goals may however be rendered weak and impossible without an efficient and effective health financing system like health insurance that extends health protection to poor, vulnerable, and under-resourced households (Alhassan et al. 2016; Abera Abaerei et al. 2017; WHO 2017; Dieleman et al. 2018).

As a consequence, tapping into the potency of the policy mechanism to drive unimpeded healthcare access has informed the adoption and further widespread implementation of health insurance in high-, middle-, and low-income polities. Australia and Canada, for example, have made substantial inroads through the implementation of a hybridized public-private health insurance scheme (Dalinjong and Laar 2012). Moreover, under the National Social Security System for health created by the 1993 approved Universal Health Insurance Scheme (Law 100), Colombia has covered approximately 95% of its population. Thailand's Universal Coverage Scheme implemented in 2011 has also enhanced 95% population-wide coverage (Health insurance system research-HIRSO 2012). The National Health Insurance in Taiwan ensured over 90% population coverage by 2001 (Hsiao and Cheng 2013).

These enviable health insurance policy achievements in other polities notwithstanding schemes in other countries have yielded malnourished outcomes. A typical example is the National Health Insurance Scheme (NHIS) in Nigeria which has aided a woeful 5% population coverage (Arin and Hongoro 2013; Kumi-Kyereme et al. 2017; Uzochukwu et al. 2015). The National Social Security Fund (NSSF) and National Health Insurance Fund (NHIF) of 1966 and 1965, respectively, have collectively enhanced a 10% coverage of Kenya's population (Kiplagat et al. 2013; Abuya et al. 2015). Moreover, the operation of multiple schemes, thus the National Health Insurance Fund (NHIF), Social Health Insurance Benefit, Community Health Fund (CHF), and Tiba Kwa Kadi (TIKA) with other private health insurance schemes like the National Insurance Corporation, MEDEX (T), AAR4 health insurance, and strategies insurance in Tanzania, is reported to have enhanced a 16% population coverage (Dutta 2015). The situation in Ghana regarding health insurance coverage is pegged at an unappealing 38%. As much as easing financial burden on the poor underpins the part of the reasons for the introduction of Ghana's health insurance, substantial evidence of discontentment (for both enrolled and non-enrolled) and subscription inability particularly for the poor is evident (Arkorful et al. 2018; Amu et al. 2018). This has provided the motivation to investigate the "push" and "pull" underpinnings of health insurance subscription in a developing country like Ghana.

### Health Insurance in Ghana

With the proximate reason of extending healthcare while saving poor households from catastrophic health expenditures brought about by the out-of-pocket payments, the government of Ghana implemented the NHIS under parliamentary Act 650 in 2003. Under a legislative instrument (LI) 1809, the National Health Insurance Law Act 650 received a legal backing (Arkorful et al. 2018). As captured in Act 852 (2012), the scheme obligates Ghanaian and non-Ghanaian residents to subscribe. The source of funding for the scheme is drawn from multiple sources including 2.5% of value-added tax (VAT) placed on goods and services as insurance levy and 2.5 deductions from formal public sector workers' Social Security and National Insurance Trust (SSNIT) pension contribution (Amu and Dickson 2016).

In addition to funds allocated to the health insurance fund of the NHIS by Ghana's parliament, the scheme is also funded by grants, donations, gifts, and other voluntary contributions (Boakye-Frimpong 2013). With respect to benefits and service coverage, though the scheme does not pay for all medical conditions treated at NHIS-accredited health facilities, it covers about 95% of disease burdens including malaria, diarrheal diseases, and upper and respiratory tract disorders (Alhassan et al. 2016; Arkorful et al. 2018). NHIS subscribers are entitled to medical emergency benefits such as road traffic accidents. Under a policy reform, pregnant women enjoy exemptions from NHIS premium payments. And more than 60% of NHIS-active subscribers are under premium exemptions. They include people under 18 years, 70 years, and above, pregnant women, indigents, and pensioners (Arkorful et al. 2018). Becoming an active member requires the individual to register and pay a premium fee after which a subscription membership card is issued. Presently, premium payment varies for SSNIT and non-SSNIT contributors. Whereas the former pays 6 cedis (equivalent of US$ 1), the latter pays 24 cedis (equivalent of US$ 4.2). In view of the benefits offered by NHIS (i.e., as a guarantor of securing healthcare), Ghana has experienced an acute improvement in healthcare accessibility, with an attendant elevation in population health outcomes (Alhassan et al. 2016). The National Health Insurance Authority (NHIA) is the body responsible for the scheme's regulation (Arkorful et al. 2018).

## Materials and Methodology

### Study Design and Context

To provide relevant insights into "push" and "pull" behavior factors relative to health insurance subscription, the research team undertook a qualitative descriptive study from 1 February to

20 April 2019 in the Tamale Metropolis of Ghana. As part of the data collection process, relying on the recommendations of Angen (2000), the study resorted to the interpretivist research approach. This helped in gathering information on participants' feelings, experiences, and beliefs. In addition to enhancing mutual interaction between the research team and study participants, it also helped in understanding participants' narrative from the experience of real-life perspective (Angen 2000).

### Study Participants and Sampling Procedure

Using a purposive sampling technique, the study collected data from 130 participants in the Tamale Metropolis. The study participants were categorized into two (2) groups: subscribers and non-subscribers. Given that the minimum age for self-subscription is eighteen (18), the use of purposive sampling method ensured the selection of participants. With these classifications as eligibility benchmarks, the study gathered relevant data for the study. To enhance classification, the study inquired participants' status of being either a subscriber or otherwise.

### Sociodemographic Characteristics of Key Informants

To intensify data gathering and enhance diversification in participants' responses to enrich the discourse, the study gathered information from key informants like health practitioners and scheme managers who are considered as important stakeholders. Among the health practitioner class, the study recruited five (5) males and females each. Scheme managers recruited for the study included nine (9) males and one (1) female.

### Data Generation Tool and Procedure

In eliciting data, an in-depth three-section interview guide with questions designed to suit the conceptual model (TPB) was used. The first segment of the questionnaire helped in gathering data about the sociodemographic characteristics of study participants. The second and third parts focused on the "push" and "pull" factors, respectively. Data collection prioritized the convenience of participants. In collecting data, participants were interviewed at their own convenience. The instruments used for data collection included a tape audio-recorder, a notebook, and a pen for writing. The 30–60-min interview was audio-recorded to enhance verbatim transcription. Before the commencement of data collection, a pilot test was conducted with a sample population of twenty (20) in the study area. This helped in validating and refining the instrument. Taking into consideration suggestions from the pilot, the instrument was refined and submitted to a team of academic researchers for final approval. The results of the pilot study were however not included in the final data. Study participants were assured of the anonymity and confidentiality of information provided.

### Data Analysis

The study made use of the inductive and thematic approach of data analysis to establish research themes and situate discourses within appropriate contexts. This offers researchers the advantage of capturing hidden and varying aspects of a subject matter under investigation (Dimitroff et al. 2005). The inductive and thematic approaches help researchers to draw original and reliable information for drawing themes (Srivastava and Thompson 2009). Following the recommendations of Morse and Richards (2002), data analysis steps involved interview transcription, listening to audio-recordings, gathering detailed insights, and developing and establishing data codes to generate themes. Finally, data gathered were subjected to content analysis. This helped in identifying, analyzing, organizing, and describing data results in a detailed and rich pattern (Braun and Clarke 2006). In presenting results, feedbacks of participants were presented as quotations to buttress expressed opinions.

### Study Settings

The Tamale Metropolis is one of the six metropolitan assemblies in Ghana, and the only Metropolis in the Northern region, namely, Upper East, Upper West, and Northern regions. The Tamale Metropolis was established by a legislative instrument (LI 2068). This elevated the then Municipal Assembly to a Metropolis in 2004. Tamale shares boundaries with the Sagnarigu District to the West

and North; Mion District to the East; East Gonja to the South; and Central Gonja to the South-West. The Metropolis with an estimated land size of 646.90180sqkm lies between latitudes 9° 16 and 9° 34 North and longitudes 0° 36 and 0° 57 West. There are 115 communities in the Metropolis. The population of Tamale Metropolis, according to the 2010 Population and Housing Census, is 233,252 representing 9.4% of the region's population. Males constitute 49.7% and females represent 50.3%. The population of the metropolis is youthful (almost 36.4% of the population is below 15 years) with a small number of elderly persons (60 years and older) representing 5.1%. Tamale has government and private hospitals, with the Tamale Teaching Hospital as the biggest (Ghana Statistical Service 2012).

## Results

Study participants (Table 1) were made up of males 58 (45%) and females 72 (55%). With regard to age, participants within the range of 18–25 were 25 (19%). Thirty-one (31) were within the range of 26–35. Other 13 (10%) belonged to the range of 36–45. While 39 (30%) participants were aged between 46 and 50; participants aged fifty (50) were 22 (17%). In terms of education distribution, apart from eight (8) participants (making up 6% of the study population) who have not had formal education, all had some form of formal education. Also, with respect to marital status, eighty-one (81) were married, 42 single, 2 divorced, and 5 widowed. Moreover, on religious distribution, study results revealed thirty (30) Christians and 85 Muslims; fifteen (15) belonged to neither of the divide. In terms of ethnicity, majority of participants were Dagombas (93). Overall, the study recorded a participation of sixty-five (65) subscribers and non-subscribers each.

### Emerging Themes

Interaction with participants revealed a gamut of factors underpinning health insurance subscription. From the analysis of data gathered, emerging highlights revealed two broad themes: "push" and "pull" factors. Thematically discussed below are the broad themes and their respective embedded subthemes (Tables 2 and 3).

### Push Factors (Health Insurance Subscription)

Push factors in relation to this study refer to factors that motivate health insurance subscription. The study revealed the performance of health insurance subscription behavior to be akin to consumer (i.e., subscriber or prospective subscriber) behavior in relation to a commodity and/or a

**Stakeholder-Centric Exploration of Health Insurance Subscription, Table 2** Characteristics of key informants

**Stakeholder-Centric Exploration of Health Insurance Subscription, Table 3** Emerging themes

| Push factors | Pull factors |
|---|---|
| Subscriber resourcefulness, e.g., affordability | Service quality perceptions |
| Perceived benefits, e.g., free medication | Restriction on medical supplies |
| Perceived safety net considerations | Service providers' attitude |
| Social network recommendations | Bad experience(s) of health service seekers |
| Personal principle/ obligation | |
| Decision of other masses | |

Source: Field data 2019

product (i.e., health insurance). In this view, the study further confirmed that subscription intention is based on a set of rational and regimental cluster of individual considerations and judgments. Among some of the specific items identified comprise subscriber resourcefulness, perceived benefits (e.g., free medication), social security guarantee considerations, social network recommendations, personal principle/obligation, and decision of other masses. Regarding subscriber resourcefulness, most participants emphasized affordability as a key push factor to subscription intention. Essentially, participants' responses confirmed that subscription goes hand in hand with resource availability. A subscriber emphasized that:

> *With the wherewithal to subscribe, I will. Ordinarily, who wouldn't want to subscribe to good things. That is motivating. So, in this case, with the needed financial resources, given the sensitive nature of health its certainly more than 100% to subscribe to.*

Another added that:

> *Per the benefits, I will surely subscribe and even ask others to do same since it would guarantee a year-round cheap and affordable access to healthcare.*

Interaction with scheme managers corroborated resourcefulness as another key push factor. A participant intimated the following:

> *Subscribers only get onto the scheme when there is money. It is largely out of affordability considerations that people get to register.*

Another push factor that emerged was perceived safety net considerations. It was obvious that, in addition to the provision that insurance package would take care of health-related emergencies while enhancing easy access to healthcare, individual expectation of the scheme as a safety net significantly informs subscription. A scheme manager had this to say:

> *You know our metropolis and region is widespread with poverty and illness. So, many people subscribe to the scheme because they think it would help care for them. So, they think it is a form of savings that would help them in critical times in future*

Another subscriber stated that:

> *Am a single mother with no sustainable source of income. if I don't register, who is going to help me pay medical bills? I registered because I am told it will cover me and my kids. With no support, we have no option than to subscribe. It is, our last hope.*

Moreover, the study revealed that individual subscription intention mostly stems from word-of-mouth recommendation from within social networks like family relations, friends, and other important people whose counsel they hold in a higher esteem. A participant stated that:

> *I went to hospital somewhere last year. My hospital bill was too outrageous. So, the medical doctor advised I subscribe. He explained the benefits and I was convinced. I have never regretted subscribing.*

Another medical practitioner echoed that:

> *Sometimes non-subscriber patients come to hospital and they are unable to pay their bills. So, myself and some colleagues ask them subscribe. And they do. Maybe they adhere to our counsel because they think we know best when it comes to issues of health care.*

A scheme manager also recounted that:

*Some people come here to subscribe based on recommendations of relations and other influential people. That happens. Even today, I can count not less than ten (10) people who came to register because they were asked to do so.*

Also, the study further underscored the theme of perceived benefits as very cardinal to subscription. Participants regard subscription as investments. For this reason, they think that higher dividends from such investments could be convincing to subscribe to the policy. On this score, a participant recounted that:

*I think subscription is like investment. Rationally, nobody makes worthless investments. Same applies to health insurance. If I would be assured and guaranteed medication, free drugs, laboratory tests and other clinical benefits, why not join?*

Another also stated that:

*I subscribed because I am told it covers medical needs. And truly I have benefited. Even though not all medications are supplied, basic ones are.*

The above resonated with what appeared in an interaction with a medical practitioner and a scheme manager. In a consistent response, the following was shared:

*In view of the low-quality life here, one thing that drives subscription is the free medication*

The personal principle or moral obligation of the individual to take measures to protect his or health was considered very cardinal to subscription. Participant responses revealed that some participants who had developed subscription principle were those who had experienced ill-health. This has made them resolve to maintain good health by subscribing to the scheme. A participant had this to say:

*After recovering from a long illness, I subscribed to the scheme as a means to protect my health*

Another stated that:

*From recommendation of doctors and others, like never before, I now have made it my principle to care for my health. So, I have subscribed to protect my health.*

Finally, study interaction provided sufficient evidence to the effect that the decision by the majority to subscribe could have a ripple and trickle-down effect on others to do the same. The interaction elicited the following responses from scheme managers:

*When people subscribe, there is the tendency for others to be pressured to do same. So, I think subscription by many people could further drive others*

*From experience as a scheme manager, I think there is a bandwagon effect. When many people subscribe, either on same or another day, other people follow up because they are under compulsion to do same*

*A participant said that:*

*I registered because many people in my family have. My father, mother, brothers and sisters all have. Am the only person left out. I have registered now.*

*Another participant also recounted that:*

*I have not subscribed; I think I should do so because most people within my social network have done that. I will subscribe.*

## Pull Factors (Health Insurance Subscription Behavior)

Regarding this study, pull factors are conceptualized as factors which have the potency to dissuade or demotivate individuals from subscribing, hence posing barriers. Some of the factors identified in this respect revolved around low service quality perceptions, restrictions on medical supplies, service providers' negative attitude, and bad experience(s) of health service seekers.

Concerning low service quality perceptions, participants were almost consistent in their responses. Expressing views on health service quality, study participants equated health service delivery to product brand which in their view is driven by consumer quality perceptions. It became obvious that, just as high-quality service may result into a huge patronage, the reverse could hamper patronage. Talking about the low service quality perceptions, some subscriber participants said that:

*Sometimes there is a difference in service benefits between insurance subscribers and out-of-pocket paying non-subscribers/health service seekers. Subscribers are mostly not given much attention at the hospital.*

Other non-subscribers reiterated that:

*When I go with money, I don't spend much time. I am quickly attended to. Those who have subscribed would still remain in long queues waiting.*

*I don't see the need to register for a scheme that wouldn't serve me well. Whenever we go to hospital with money, we seem to come home earlier than subscribers. Hospitals care much for those paying money*

Other participants also touched on the issue of restrictions on medical supplies. These were equally captured in the concerns raised by some key informants like medical practitioners. Some participants had the following to say:

*Mostly the medical supplies are substandard. On some occasions, the prescribed drugs are not supplied. And they ask us to buy the rest, which are expensive in pharmaceutical shops.*

Another also recounted that:

*A health insurance scheme that does not guarantee drugs? Could this be a reliable insurance scheme?*

Some non-subscribers also emphasized that:

*Stories about the low-quality drugs supplied is not motivating enough for me to subscribe. Rather prefer paying from my pocket.*

*My friends have always been complaining about the issue of non-availability of drugs any time they attended hospital with health insurance card. What's the need to subscribe?*

A medical practitioner recounted that:

*At the moment, I think there is general apathy to scheme subscription. Some think they hardly get the required benefits. I fear this could affect the sustainability of the scheme.*

The negative attitude of health service providers appeared as a key pull factor likely to substantially impair subscribers and non-subscribers alike. In the views of participants, this negative attitude kills the resolve to perform health-seeking behavior. Interactions yielded some responses as follows:

*The attitude of some practitioners is very bad and unprofessional to say the least. They easily get angry*

*Some of the nurses care less. Whether the patient is reeling in pains or not, that is none of their business. They are mostly obsessed with their phones and other things*

A medical practitioner also said the following:

*Actually, I think the attitude of some of my colleagues towards patients is uncalled for. As much as these attitudinal challenges discourage patients from seeking medical treatment, it also cuts a slur on our professional image and integrity.*

A scheme manager rehashed the following:

*Over the years, we have heard a lot of stories about the ill treatment subscribers undergo when they visit the hospital. It has been persistent. This is very discouraging. This isn't the best of news and experience for service seekers.*

## Discussion

The proximate behavior antecedents to health insurance subscription, to the best of the knowledge of the authors, have neither been sufficiently explored nor received adequate research attention, more particularly in Ghana. The reason for this study was to investigate "push" and "pull" factors relative to health insurance subscription in the Tamale Metropolis of Ghana. The researcher is convinced that this seminal research will make unique, valid, and reliable contributions to health insurance studies in Ghana and even beyond. Even though study findings revealed that health insurance plays a cardinal role in accessing healthcare in Ghana, it equally reveals insightful yet interesting findings.

Precisely about the push factors, the study revealed that subscriber resourcefulness which was in turn proven to have a significant correlation with affordability was a push factor that could enhance the performance of health behavior like health insurance subscription. Resourcefulness, which enhances individual's control over subscription, in so far as the study is concerned, is captured by perceived behavior control. This is in tandem with the findings of prior studies (Arkorful et al. 2018). In consistency with the research findings of Dalinjong and Laar (2012), the study revealed that the perceived benefits like quality drugs could be a motivator for performing subscription behavior. Within the conceptual framework, this significantly correlates with attitude.

Furthermore, the study demonstrated that the perceived expectation of both subscribers and non-subscribers to perform a health protection behavior like health insurance subscription was revealed as a push factor. Elucidating on this outcome, it could be said that, in the event when individuals do not regard health insurance as a potential safety net, the performance of subscription behavior could be hampered. This is consistent with the study findings of Malupi et al. (2013). Besides, the study proved that social network recommendations and social pressure (represented by subjective norm in the conceptual framework) could be a significant push factor regarding subscription. The plausible explanation for the relevance of subjective norm could be attributed to the collectivist and communal nature of the Ghanaian society where the entire society provides some form of social protection or social security for the other (Adu-Febiri 1995). This may equally account as a reason why decisions like health insurance subscription by the masses could sway others to perform same subscription behavior.

The significance of the attitude of the masses (descriptive norm) influencing others to perform behavior is in tandem with the generalization of Hogg and Terry (2000) who emphasize that individuals are likely to perform a behavior or possibly comply with certain behavior tenets of a group which they classify or align themselves with. By extension, given the social structure within which the individual finds him or herself, the individual in turn stands to develop the moral principle or obligation to form and subsequently perform a behavior (Hogg and Terry 2000).

On the other hand, the study revealed some pull factors that could negatively impact on subscription. Prominent among them include low service quality as evidenced in the supply of substandard quality drugs. This perception affects the individual principle or obligation (i.e., personal moral norm) to subscribe. The study outcome is consistent with prior study concerns raised by Arkorful et al. (2018). The foregoing discussion makes it apparent that intention to subscribe or otherwise is predicated on an assessment and consideration of certain internal and external factors. On this basis, subscription behavior is likely to be performed when the individual assessment points to an immense benefit. In the event of the reverse, the individual is likely not to subscribe.

At this point, it is important to stress on some of the strengths of the paper. To the best of the knowledge of the authors, this is the first seminal study on health insurance subscription employing a theoretical framework to explore push and pull (antecedent factors) in Ghana. The use of a theoretical framework to ground the research discussion from the varying perspectives of stakeholders involved in health service delivery will help unearth the subtleties underpinning the performance of health-seeking behavior (i.e., health insurance subscription). Interrogating dimensions of this nature will contribute to enriching the subject matter under investigation.

This would be relevant in addressing existing gaps such as behavior factors frequently ignored in health policy, most especially health insurance policy. The study findings could provide sufficient pointers to guide the formulation and implementation of health policies around the world. As much as the research strengths have been highlighted, it is instructive to state the research limitations. The limitation of the study to the Tamale Metropolis, and the use of a sizeable sample limits the generalizability of the study findings. Future studies should focus on increasing the sample size and expanding the scope of the study settings to undertake a large-scale study. Given the use of qualitative approach, future studies should endeavor to focus on employing quantitative methods. Actually, this is the next study to be commissioned. These limitations however do not in any way constrain the validity and reliability of the study findings.

## Conclusion, Recommendations, and Implications for Policy, Practice, and Further Research

In the light of the concerted global efforts by governments and nongovernment entities in pursuing UHC goals (geared toward removing barriers to healthcare access for all populations), the

stakeholder-centric study conducted in the Tamale Metropolis of Northern Ghana probes push and push factors regarding health insurance subscription within the context of grounded theory. The implication of the push factors is that while subscribers may be encouraged to continue subscription, non-subscribers will be encouraged to also subscribe. Conversely the consequence of the pull factors is that already subscribed members and prospective subscribers may be discouraged.

Summarily, given the pertinence of health financing mechanisms like health insurance to the attainment of health-related SDGs and the UHC goals, it would be prudent for policy makers and other stakeholders alike to capitalize on the push factors to drive subscription. At the same time, stakeholders should endeavor to institute measures that would help countervail all possible policy challenges inimical to the sustainability of the health insurance. While these would help boost subscriber and non-subscriber confidence, it would also help populations in general, and vulnerable populations in particular, to maximize benefits from the scheme and save them from unforeseen catastrophic health expenditures. Overall, Ghana could be said to be positioning itself in a much better strategic position to realize the health-related SDG by the year 2030.

Given the confounding confluence of perspectives shared by various stakeholders, the research recommends that efforts exerted toward enhancing efficiency and effectiveness of the health insurance policy in Ghana should take into cognizance the following recommendations:

- To help cure the negative perception regarding the policy, the NHIA, in concert with other stakeholders like the GHS and MOH, should help sensitize health practitioners to assign some modicum of decency and urgency in the exercise of their duties.
- Heads of health institutions must not only put in place but also enforce disciplinary measures to punish recalcitrant and unprofessional behavior.
- Health institutions must also put in place award and reward mechanisms to motivate workers who exhibit professionalism while in the line of duty. This would urge other workers to aspire to do the same and possibly win awards.
- To the issue of medication challenges experienced by health seekers, as part of measures to inject some dosage of efficiency and effectiveness in the scheme, health administrators, the NHIA, and stakeholders must prioritize keeping accurate records of medical supplies to be able to restock timely and avoid unnecessary shortages. Stakeholders must also endeavor to supply quality medications to health seekers.
- In view of the above, the NHIA as the regulator must strictly play its role as an able gatekeeper. By doing so, the authority must put in place mechanisms to assess and evaluate satisfactory or unsatisfactory health service provider institutions and, where possible, reward and punish accordingly.
- Regular organization of inter-stakeholder briefings should be made an integral part of an overall health system culture. Central to this should be a discussion about inherent lapses and challenges characterizing the scheme. This would help put in place measures to countervail them as and when they occur.
- Civil society organizations as neutral umpires, gatekeepers, and watchdogs in state-building enterprise have a role to play. CSOs may spearhead a public advocacy entreating health sector actors and other nongovernmental organizations to attach some degree of decency and urgency in ensuring the efficient operationalization of the health insurance scheme. To ensure the generation of reliable policy-based information about the scheme, CSOs should prioritize and encourage scientific health research.

# State Action Doctrine and Public Administration

Steven J. Macias
School of Law, Southern Illinois University, Carbondale, IL, USA

## Synonyms

Horizontal application of human rights; Horizontal effects of constitutional rights; Horizontality

## Definitions

Horizontal: refers to the relationship among private individuals where the state is not directly involved
State action: action attributed to the government or one of its agents, whether of a legislative, executive, or judicial character
Vertical: refers to the relationship between a government and one of its citizens

## Introduction

In most constitutional democracies, the state action doctrine is known as the problem of horizontality. In the United States, "state action" has developed as a doctrine of federal constitutional law designed to indicate the domain of action to which constitutional protections apply. If injurious action is not that of the state or one of its agents, then an aggrieved party cannot claim a violation of a constitutional right. In other countries, the question is usually phrased in terms of the extent to which constitutional guarantees have horizontal application, that is, application as between private parities rather than strictly vertical application as between the government and a citizen. In American constitutional law, the general rule is that constitutional rights have no judicially recognized horizontal application.

Turning to other constitutional systems, the situation is decidedly more complex, not only in

terms of the varieties of solutions to the problem of horizontal effect but also in terms of the light comparative analysis sheds on the American state action doctrine. If the United States stands at one end of the spectrum in that it provides for no application of constitutional rights to private actors, then South Africa stands at the opposite end with its constitutional provision that expressly binds private persons to compliance with the Bill of Rights. Lying somewhere between these two poles are the systems of many other constitutional democracies, including Canada, the UK, Germany, and Ireland. While none of those countries claims a direct effect of constitutional rights on private actors, they all engage in various indirect methods of application (Gardbaum 2003, 2006; Michelman 2009).

## The Problem of State Action

Scholars recognize the problem of state action as a very much contested and unresolved issue. The basic question is this: Who is bound by constitutional prohibitions? To say that a constitution has vertical application, as illustrated in Fig. 1, is to say that a government's sovereign relation to its citizens is mediated through the constitution. A governmental action must be constitutional in order to validly operate on an individual. If a constitution has only vertical application, then only a government or a governmental official can be named as a defendant in a lawsuit claiming a constitutional violation. In other words, a legal cause of action lies only against the state. This describes, at least formalistically, many constitutional regimes, including the United States.

By contrast, a constitution might have direct horizontal effect, meaning that it binds the actions of nongovernmental actors. For example, Chapter 2, Section 8(2) of the South African Constitution says, "A provision of the Bill of Rights binds a natural or juristic person if, and to the extent that, it is applicable, taking into account the nature of the right and the nature of any duty imposed by the right." Likewise, one provision of the US Constitution does apply to non-state actors – the prohibition on slavery contained in the Thirteenth Amendment (Rutherglen 2008). In principle, if a constitutional provision has direct horizontal application, then one private party can be held directly liable to another private party for what amounts to a constitutional tort. The uncommonness of direct horizontal application is perhaps best illustrated by Fig. 2, which depicts the usual citizen-to-citizen legal relationship. Most everyday interactions among individuals are governed by private civil law – contract law, tort law, property law – not constitutional law. If a constitution has horizontal effect, then it is the constitution that would supplant the usual civil law in governing interpersonal relations, as illustrated in Fig. 3.

It is the space between vertical application and direct horizontal application that has proven most interesting, yet most perplexing. A constitution

**State Action Doctrine and Public Administration, Fig. 1** Vertical effect of a constitution. This depicts a government's typical relationship to its citizens as mediated through the constitution

**State Action Doctrine and Public Administration, Fig. 2** Horizontal effect of nonconstitutional private law. This depicts the usual legal relationship among citizens as mediated through private law

**State Action Doctrine and Public Administration, Fig. 3** Direct horizontal effect of constitutional law. This depicts the unusual situation where a constitution directly mediates private citizens' relationships

might have, what some call, indirect horizontal effect. For a constitution to have indirect horizontal effect might mean several different things. It might mean that the constitution directly constrains the judiciary in its application of private law, what some call "hard" indirect effect. Hard indirect horizontal effect would occur if the judiciary explicitly altered the common law in furtherance of a party's constitutional right. A less severe form of indirect effect would be "soft" indirect horizontal application. This might occur if a court invokes constitutional values as background principles of common law adjudication or, as Eskridge calls them, "constitutional principles and background norms" of statutory interpretation (2016, p. 307). As Fig. 4 indicates, indirect horizontal effect means that private civil law is still the primary means of mediating citizen-to-citizen relationships. The constitution's indirect effect comes about through the impact that constitutional forces have on private law. One might further think of the hard/soft distinction in graphical terms, where the degree of the indirect effect is illustrated by the extent to which the constitutional force impacts the shape of the private-law box. The less recognizably rectangular the private-law box in Fig. 4 becomes, the more work constitutional law is doing, and the more difficult the private law is to recognize as private law.

Indirect horizontal effect is sometimes hard to identify in practice, but it is quite prevalent, even in the Unites States. For example, the Supreme Court has placed First-Amendment limitations on the common law of defamation and invasion of privacy due to potential interference with free speech rights (Nimmer 1968). The court's worry was that a potential defamer or privacy invader would be unconstitutionally silenced were a court (a state actor) to impose liability upon him. This "hard" application has resulted in the constitutionalization of this area of tort law. In addition, the Supreme Court's rule of "constitutional avoidance" in statutory interpretation might be thought of as a sort of "soft" indirect effect (Stephenson 2008). This canon of construction says that if a statute is susceptible of two interpretations – one clearly constitutional, the other constitutionally dubious – the court must select the interpretation that strays furthest from constitutional doubt. One could view this interpretive canon as a way of applying the legislature's work – the statute – against the backdrop of constitutional values even while adjudicating claims among private parties. In both examples, the tort of defamation or the statute must pass through constitutional constraints even though it is technically the common law or the statute operating among the parties. See Fig. 4.

Other nations have long been engaged in more conscious consideration of indirect horizontal effect than the Unites States. (Sajó and Uitz 2005). For example, in the UK, both judges and scholars have produced an impressive body of literature as to the horizontal effects of the Human Rights Act of 1998, which provided for domestic enforcement of European Convention rights (Phillipson and Williams 2011). South Africa, because of its unique direct horizontal provision, has also sparked much commentary (Bedi 2015; Chirwa 2006). Some have attributed the South African Bill of Rights'

**State Action Doctrine and Public Administration, Fig. 4** Indirect horizontal effect of constitutional law. This depicts how the usual legal relationship from Fig. 2 is affected by the indirect impact of a constitution on private relations

application to private citizens to the legacy of apartheid. That nation recognized the role non-state actors played in wide-scale oppression and very deliberately added the language binding private parties (Nolan 2014).

## History of the US Doctrine

The American state action doctrine can largely be traced to a Supreme Court opinion in the *Civil Rights Cases* from 1883. In that opinion, the court held unconstitutional the Civil Rights Act of 1875 as exceeding Congress's power to enforce the guarantees of equal protection and due process of law. The Act contained a basic public accommodations provision that prohibited private actors from engaging in race discrimination in facilities, inns, conveyances, and the like. However, the constitutional provision that Congress claimed to be enforcing, the Fourteenth Amendment, says, "No State shall . . . deny to any person within its jurisdiction the equal protection of the laws." The court concluded that, by its very language, only a state can violate the constitutional guarantee of equal protection. Therefore, the Act that prohibited private discrimination could not be said to be an enforcement of the constitutional text (Civil Rights Cases 1883).

The next important state action cases did not arise until the mid-twentieth century during the Civil Rights Era. In 1948, the Supreme Court decided *Shelley v. Kraemer*, where it held that a state court judgment enforcing a racially discriminatory real estate covenant constituted state action and was therefore subject to the constitutional prohibition on the denial of equal protection. Even though the covenant was the product of private agreement, the court nevertheless acknowledged that but for the trial court's actions, the private parties would be unable to enforce their discriminatory desires (Shelley 1948).

As the Civil Rights Era progressed, the court decided *Burton v. Wilmington Parking Authority*, probably the most far-reaching state action decision to date. In *Burton*, the court held that a privately owned restaurant, which leased premises owned by the state, violated the constitutional guarantee of equal protection when it refused to serve a black customer. On its face, this appears to be the sort of private conduct that the invalidated Civil Rights Act of 1875 attempted to prohibit. However, the court found that "the State [had] so far insinuated itself into a position of interdependence" with the discriminatory restaurateur in benefiting from the lease agreement that the state and the private party could be considered joint actors (Burton 1961, p. 725). The court thought that it was incumbent upon the state to include some sort of non-discriminatory clause in its contracts with private lessees in order to comply with the equal protection requirement.

As the Civil Rights Era came to a close and a more conservative era began to dawn with the election of Richard Nixon, the court reversed course as evidenced by its 1972 decision in *Moose Lodge*. There, the court held that a privately owned business that held a liquor license from the state was not bound by the constitution's equal protection requirement when it refused to admit black members. The court found that the state's liquor licensing laws were in no way intended to encourage private discrimination and thus neither the state nor the proprietor could be found to have engaged in a constitutional violation. Unlike in *Burton*, the court in *Moose Lodge* did not suggest that it was constitutionally incumbent upon the state to insist upon a non-discrimination agreement from the private citizen before in conferred the benefit of the liquor license upon him. To do so, the court thought, "would utterly emasculate the distinction between private as distinguished from state conduct set forth in *The Civil Rights Cases*" (*Moose Lodge* 1972, p. 173).

It is no surprise that Charles Black called the state action problem "the most important problem in American law" after reviewing the Supreme Court's 1966 term. Black claimed, "The amenability of racial injustice to national legal correction is inversely proportional to the durability and scope of the state action 'doctrine,' and of the ways of thinking to which it is linked" (Black 1967, p. 70). In other words, scholars have long recognized that the extent to which constitutional

goals and values, like equality and liberty, are realized depends a great deal on how actively the state insists that private parties conform their actions to those goals and values.

## Critiques of State Action

Critics of the state action doctrine abound, but so do defenders. As stated above, a court's conclusion that state action is absent most often harms those who face some sort of discrimination, especially racial discrimination. Two common arguments in support of a strong state action requirement come from theories of democracy and liberty (Nolan 2014). Critiques of the state action doctrine are both descriptive and normative.

From the perspectives of democracy and the separation of powers, judicial review, especially the strong sort that prevails in the United States, poses a countermajoritarian dilemma (Bickel 1962). When unelected judges give horizontal effect to constitutional rights through indirect means they subvert democracy in, perhaps, two ways. First, such a judicial decision removes responsibility for governing interpersonal relations from the legislative branch to the judicial branch. Second, due to its indirect nature, the judiciary's actions might not be particularly obvious to the citizenry, thus making checks and balances that much harder to function.

From the perspective of liberal theory, a state action requirement is necessary in order to safeguard a space for liberty of conscience, association, and privacy. This rationale is popular with conservative thinkers in the United States. Indeed, for those committed to a kind of libertarianism, the requirement of state action insures that private citizens will not be forced to conform their actions to constitutional notions of equality or fairness.

Many critics begin with the descriptive critique that the state's presence is felt even in so-called private actions (Sunstein 1993, 2002; Tushnet 2008). To take the most basic example, private property exists only because the state is there to protect it, legislatively, administratively, judicially, and if necessary, by force. Thus, perhaps the constitution, unaided by legislation, should constrain a non-state actor from using his property to discriminate against another citizen. The point here is, as Sunstein proclaims in the title of his article, "state action is always present" (2002). Some defenders of the state action principle do not deny this point; rather, they claim that the doctrine is fundamentally about controlling governmental agents. They see the state-backed power of state actors as more dangerous than the state-backed power of non-state actors and, for them, the doctrine is an "accountability mechanism" for the exercise of state power (BeVier and Harrison 2010, p. 1806).

Proponents of horizontal effect, both in the United States and elsewhere, regularly emphasize the particular rights at stake, especially economic, social welfare, employment, and equality rights (Bedi 2014, 2015; Nolan 2014; Seidman and Tushnet 1996; Tushnet 2008). They claim that the US state action doctrine reinforces a now-rejected laissez-faire understanding of the role of the state in American life (Sunstein 1993). Other critics have similarly foundational claims. Chemerinsky (1985) argues that the state action doctrine fails to adequately grapple with the concept of rights, whether that concept is approached from a positivist or natural law perspective. Hershkoff (2011) calls for the use of constitutional "penumbra and emanations" to inform private adjudication. She recognizes that this sort of indirect horizontal effect is already present in some areas of law and calls for a more expansive and conscious use of it.

## Conclusion

The state action problem is fundamentally about the exercise of government power. Those who believe that government power can be a positive force in securing individual rights naturally favor more widespread application of constitutional protections against non-state actors. By contrast, those who are suspicious of government power see the flourishing of individual rights in the absence of government constraint. As Tushnet (2008) has recognized, the ease with which a nation applies its constitutional constraints to non-state actors largely depends upon the extent

to which there is national agreement on substantive commitments, like equality or social welfare. In a nation like the United States, where those sorts of substantive ideological commitments are continually and vigorously contested, horizontal application appears to be a more intractable problem but a problem that can be greatly illuminated within a comparative framework.

Administrative reforms in Turkey

## Introduction

Turkey, with a population of 78.5 million, has undergone profound changes especially over the last two decades. Turkey will have a population of 85 million in 2023 according to TUİK's (2016) projections. Around 70–75% population is made up of the people of Turkish ethnicity but includes people from various ethnic, cultural, and religious backgrounds (i.e., Kurds, Armenians, Greeks, and Jews). This diversity has been used to justify a strong centralist state and administrative structure in Turkey, which, in turn, has been considered as an efficient method to build nation state and achieve national unity and administrative integrity, modernization, and economic development.

Turkish democracy is a relatively developed parliamentarian democracy with a system of free elections and several competing parties. Turkey ranks the 72nd out of 188 countries in the Human Development Index among the high human development countries up from the 79th in 2010 (UNDP 2015). According to the democracy index prepared by the Economist Intelligence Unit (EIU), Turkey is considered as a hybrid regime and ranks the 97th out of 167 countries in 2015 in the world down from the 88th in 2010 (EIU 2015). Turkish democracy also has some further shortcomings in the areas of basic human rights and freedoms and the rule of law and representation. For instance, some undemocratic characteristics of Turkish party system and party leaderships; limitations on the freedoms of the press, expression, and assembly (i.e., frequent social and news media blackouts) and on labor rights along with indirect restrictions on the political participation; and the 10% national threshold all deteriorate the existing problems of the democratic system in Turkey.

The history of Turkey, going back to the last century of the Ottoman Empire, is a story of strong reform initiatives, westernization, and increasing ties with Europe. Turkey has turned out to be one of the most, if not the most, democratic, secularist, and modernist country among the Muslim World (Aydın and Keyman 2004, p. 19; Friedman 2009, pp. 114–115) due mainly to the progress started by Atatürk, the founder of the Republic of Turkey, and the developments especially during the 1980s and after 1999. Turkey's integration efforts to the EU and economic relations with the EU since 1963 are a concrete example of her continuing aspiration for modernization and democratization. Turkey was officially announced as a candidate country for EU membership in 1999 and began full membership negotiations with the European Union in 2005.

The beginning of the neoliberal era and the related reforms started in the early 1980s, witnessing the army coup, the adaption of a new constitution, and the liberalization of the economy (Sallan Gül 2006, pp. 281–300). The policies in the 1980s were in general successful in reviving economic growth, achieving economic liberalization, and changing statist import substitution policies to export-oriented growth policies (Öniş 2004). In contrast to economic reforms, the political and administrative reforms were very slow. Thus, several problems continued to exist into the new millennium such as a centralistic and statist political and administrative system, undemocratic military influence on the political system, the Kurdish problem, human rights problems, and problems in the implementation of the rule of law and market principles (Heper and Keyman 1998, p. 266; Öniş 2004, p. 114, 130).

During the first half of the era of the Justice and Development Party (AKP or AK Parti) governments, Turkey has achieved a steady and high economic growth rate, political stability, and many reforms. Öniş (2006, p. 131) states that the AKP presented itself to the electorate as "a reformist and progressive force" that "could bring benefits from the positive aspects of economic globalism and the free market; and that could reform the state in the direction of a post-developmental regulatory model." The first wave of the reforms by the AKP governments focused on transforming the structure of the state and public administration (central, regional, and local) by enhancing the rule of law, human rights, and gender equality; improving market mechanism; increasing the functioning of public administration and participatory public policy making

processes; and meeting the EU norms, among others (Aydın and Keyman 2004, pp. 16–17; Çelenk 2009, p. 50; Sözen 2012).

However, the rate of economic growth and the pace of reforms slowed down after the financial crisis of 2008. This slowdown has continued and even worsened due to the consequences of the Arabian Spring, mainly the unprecedented influx of migrants from Syria and Iraq, and increased PKK insurgency after 7 June 2015 general elections in Turkey. The deterioration of the social, economic, and political conditions in recent years and failed July 15, 2016 coup attempt have brought the reform efforts to a halt. Yet, Turkey is still in need of realizing further institutional change and reforms to strengthen the sustainability of economic growth, administrative reform, and democratization.

The methods of the reforms have been various but could be considered to fall mainly under the paradigms of the new public management (NPM) and the new public governance (NPG) (Ferlie 2012, p. 237). The market mechanisms and principles were taken as the basic driver of change and development in the 1980s. In the 1990s, improving competitiveness and entrepreneurship in the market and in the public sector and fostering the capacity of public administration or the state as the facilitator of good governance became dominant among the methods of the NPM approach (Ferlie 2012, p. 243). A complementary "governance" approach based on more flexible, participative, collaborative, and bottom-up styles has also started to develop in the same period. "Governance" approach underlines interconnectedness of the world rather than increased fierce competition. In such a world, public administration is considered to promote the public interest, the equality of opportunity, the fair delivery of public services, and citizen participation (Frederickson 1997).

This chapter basically attempts to present the political and administrative structure, the transformation in these structures, and their consequences in Turkey. Accordingly, the recent reforms are reviewed and discussed, and their implementation and outcomes are evaluated. In this respect, state, democratic, administrative, and economic reforms and their policy implications are presented and examined.

## Political System in Turkey

Turkey has a multiparty parliamentary democracy based on the separation of powers between legislative, executive, and judiciary branches. Its roots go back to 1877 when the first parliament of the Ottoman Empire congregated in İstanbul. Before 1946, there was a single-party parliamentarian political system despite a couple of attempts to establish opposition parties in Turkey. The multiparty parliamentarian democracy started in 1946 when the first election involving two parties was held. One-party governments in Turkey were in general at the moderate right of the political spectrum and based on a consensus between the central elites and peripheral mass in the process of elections and government formation (Gül and Kiriş 2015). Apart from former single moderate right party governments, the AKP have refused to share power with the military, the supreme courts, and the civil bureaucracy, on the one hand, and initiated a reform of these institutions, on the other hand. Thus, the AKP have established a new type of political contra-elites, sympathizer institutions and newspapers, and socioeconomic groups. After the 2011 elections ended with the victory of the AKP again, the main topic of debate on Turkish politics has focused on the necessity to change the government system from a parliamentary to presidential democracy.

The Grand National Assembly of Turkey (TBMM) with 550 representatives is the heart of the political system in Turkey. The legislative power is vested in this unicameral parliament, directly elected by the people once in every 4 years. To avoid excessive political fragmentation and to allow the establishment of an effective majority government, only those parties winning at least 10% of the votes cast in a national parliamentary election gain the right to representation in the parliament. This 10% threshold limits the representation of relatively small groups in the parliament as in the 2002 national parliamentary elections when only two parties (i.e., the AKP

and CHP-Republican People's Party) formally entered the parliament. Currently only four political parties (i.e., the AKP, CHP, MHP-Nationalist Movement Party, and HDP-People's Democracy Party) are represented in the parliament.

The executive branch has a dual structure including the president and the government, which is made up of the prime minister and the Council of Ministers or the Cabinet. The prime minister and the Cabinet have the actual executive powers and are responsible before the TBMM. The president is elected for a 5-year term by direct popular vote since 2014 and can run for a second term. Before 2014, the president was used to be elected for a 7-year term by the TBMM and could not run for a second term. This change to an election of the president by popular vote made the political system in Turkey look more like a semi-presidential system. The current president feels further empowered by this shift, and thus, there are continuing pressures from the government for an amendment in the 1982 Constitution to change the current parliamentarian democracy into a semi-presidential system. The president is also a part of the executive branch and can exercise some administrative powers without political responsibility. For example, the president chairs the meetings of the National Security Council (MGK) and can preside over the meetings of the Cabinet if he or she chooses to do so. The president also appoints several high-ranking public officials (i.e., rectors, some members of supreme courts, and the Higher Education Council).

As in many other parliamentary governmental systems, the prime minister is a powerful political figure in Turkey. But currently, President Erdoğan is de facto the most powerful political leader. The prime minister is appointed by the president to form a government, and he or she is normally the leader of the party having the highest number of seats in the parliament. The central administration includes the presidency, the Office of the Prime Minister, the Cabinet, ministries, and consultative agencies. The Cabinet is formed by the prime minister, proposed to the president, and approved through a vote of confidence in the parliament. The prime minister (PM), as the chairman of the Cabinet, ensures cooperation among the ministers and supervises the implementation of the policies of the government. If necessary, the PM may take corrective measures including the dismissal of a minister through a proposal to the president. Each minister is responsible to the PM for the conduct of the affairs of one's ministry and for the activities of the subordinates in ministries.

The judiciary is, to a great extent, independent of the executive and legislative branches, and the Constitutional Court is charged with the duty of ruling on the conformity of laws and decrees with the Constitution. With the 2010 amendments to the 1982 Constitution, the issues regarding human rights can be brought to the Constitutional Court as individual cases before pleading the case to the European Court of Human Rights (ECHR). The Council of State is the tribunal of last resort for administrative cases and the High Court of Appeals for all others.

## Central, Regional, and Local Administrations in Turkey

The 1982 Constitution sets up a unitary state structure and a centralized administrative system in Turkey. The state and administrative system is based on the principles of centralization, decentralization, indivisible integrity of the country, unitary form of the state, and power of tutelage. Other constitutional principles shaping the political system and state structure in Turkey are republicanism, respectfulness to human rights, secularism, democracy, the rule of law, welfare state, the separation of powers, constitutional government, judicial review of administrative decisions and acts through administrative courts. According to Article 123 of the 1982 Constitution, the state and public administration system in Turkey should function in unity, coherence, and integrity at the national and provincial levels, resulting in a heavy domination of the state over the society and economy and causing administrative, political, democratic, and human rights problems.

Each ministry based in Ankara has the units in the provinces serving on their behalf in a hierarchical order and functioning according to the principle of deconcentration. For administrative purposes, Turkey is divided into 81 provinces on the basis of geographical situation, economic conditions, and public service requirements as stated in Article 126 of the 1982 Constitution. Provinces are the main geographical administrative units for central government activities, and they are headed by provincial governors. A provincial governor has the authority and responsibility for the supervision of ministerial field organizations, which also have their own provincial/regional directors. Provinces are further divided into districts, headed by the subgovernor.

The 1982 Constitution also recognizes the principle of decentralization as a basis for the organization and functioning of local administrations. Article 127 of the 1982 Constitution provides that the establishment and responsibilities of the local administrations are determined by the law in accordance with the decentralization principle. Thus, local administrations are autonomous decentralized units and responsible for the provision of local public services. Yet, the special provincial administrations and village administrations also carry out some of the duties of central government and provide assistance to the local branches of the central government, if needed.

There are four basic types of local administration units and a dual local administrative structure in Turkey since 2014. This dual system of the local administrations in Turkey was established by the law numbered 6360 and enacted in 2012 but became fully operational since 30 March 2014 local elections. The provincial special administrations, which is a province-wide local administration chaired by a governor appointed by the central government, town, district and city municipalities, and villages exist in 51 provinces. Mayors, local councils, and mukhtars (village headmen) are directly elected by the public. As of 2015, there are 81 provinces, 51 special provincial administrations, 397 towns, 400 districts, 51 city municipalities, and 18,331 villages in Turkey (İçişleri Bakanlığı 2016). In addition, there are 30 metropolitan municipalities, being the upper tier, and 519 metropolitan district municipalities, being the lower tier, in the remaining 30 provinces with a population over 750,000, which are the most developed and urbanized provinces having more than 77% of the total population in Turkey. According to the 2012 law, all the other types of local governments in those 30 metropolitan provinces were abolished after the 2014 local elections, accounting for more than 50% of all the local governments in Turkey. The metropolitan municipalities rest on a strong mayor model representing and managing municipal services in the whole province, not just urban area within the city limits. Besides, the governors in the metropolitan provinces are also assigned some new duties as the local agents of the central government regarding the coordination of economic development and distribution of central development funds in their provinces.

The municipalities are the most autonomous type of local administrations and headed by elected mayors and councils. The decision making and executive bodies of the local administrations are all elected by popular vote, except for the chair of the special provincial administration, who is also the governor of province. Yet, all local administrations are subject to close scrutiny and control of the central government exercised through the power of tutelage. That is the main reason why they are not called as local governments in Turkey. This close scrutiny has often been criticized for discouraging local initiative taking, civic activity, local autonomy, and local leadership. Accordingly, local administration reforms started in the 1980s first and then by the first AKP government in the 2000s have empowered local administrations and increased their resources and responsibilities.

Some sort of "regional" administrative units have always existed in Turkey, and they have been established as the branches of central government agencies because of some technical and service delivery necessities (i.e., road construction and maintenance, economic development, etc.). The law numbered 5449 was enacted in 2006 and provided for the legal framework for establishing development agencies (DAs) in the

26 NUTS II regions throughout Turkey. The DAs are defined as separate local-regional administration units, but national coordination among them is done by the Ministry of Development. Their main functions involve assisting the efficient use of public resources and local and regional potential for economic development and organizing and cooperating economic development and related research and education activities among different sectors. The members of the decision making bodies of the DAs include representatives from the public, private, and civic sectors, seen as a clear sign of a governance model. However, the word "regional" is not used in naming the DAs because of the centralist heritage. In addition to the DAs, there are also regional development administrations as the local branches of the Ministry of Development. They are established in only comparatively underdeveloped regions such as the Southeastern or Eastern Anatolia Regions in order to manage regional development projects stimulated and managed by the central government.

## Some Major State and Administrative Reforms in Turkey

The reforms by the AKP governments have continued with an increasing momentum, which were launched by the coalition governments at the end of the 1990s and during the early 2000s. The first wave of the reforms included the goals of restructuring public administration, establishing economic and political stability, shrinking the role of the state, and reducing budget deficits. Besides, public services at all levels were allowed to be provided in accordance with the principles of market, consumer orientation, efficiency, and competitiveness. With regard to the political reforms, some changes in the laws and the amendments to the 1982 Constitution were made to achieve compatibility with universal democratic norms. Several amendments in the 1982 Constitution have been made to improve fundamental rights, democratization, the rule of law, and the principles of the market and to meet the preconditions of the EU membership (Özbudun 2007, pp. 180–195).

Some improvements were also made in the judicial system. One improvement is the abolition of the state security courts and the special-authority courts and the transfer of their duties to the heavy penal courts. Another change involves the new duty assigned to the Constitutional Court by the 2010 amendments to the 1982 Constitution, providing that the human rights disputes are brought to the Constitutional Court before pleading the case to the ECHR. The Court has used this new duty functionally and allowed many prisoners of conscience and the press out for trial without imprisonment. A further improvement by the 2010 amendments is the establishment of an ombudsman system in order to provide confidential and impartial assistance in mediating and resolving complaints and disputes between individuals and the public administration.

However, there are some changes that cannot be seen as improvements in the judicial system. The most important of these changes is the 2010 amendments to the 1982 Constitution which provide the government to appoint several members in the Constitutional Court, the Supreme Court of Appeals, and the State Council. These specific changes increase the power of the government to oversee and influence the judicial system, supposed to function according to the principles of the independence of the courts and the security of tenure of judges. For example, the new changes allow the Ministry of Justice to sit as the president in the Supreme Council of Judges and Public Prosecutors (HSYK), a body with administrative, auditing, and disciplinary power over judges and public prosecutors after they are appointed.

Another major issue since the mid-1980s, Kurdish problem intensified in the 1990s. Kurdish demands for their ethnic and cultural recognition are considered as threats to unity of the nation state. Thus, a security-based approach was taken to resolve the problem, and the cultural and democratic demands by the Kurds had been neglected and even denied until the early 1990s. Aydın and Keyman (2004, pp. 34–35) state that security-based policies led to serious human rights abuses, a significant degree of mistrust between the state and the people in the

region, and mass migration to the cities nearby and in western Turkey. However, triggered by the emergence of EU conditionality, there has been a significant progress in the Kurdish problem over the recent years. For example, the Kurdish opening process led to the improvements in cultural and political conditions for Kurdish people. However, after 7 June 2015 elections, the process has collapsed and the conflict intensified between the state and the PKK.

Structural reform and adjustment programs promoted by the international organizations have been strictly followed and implemented by the governments in the 1990s and the 2000s. They have helped develop properly functioning markets without being interfered by the governments (such as the establishment of autonomous regulatory bodies) and increase efficiency, effectiveness, transparency, and accountability in the public sector. The new Penal Code was amended to provide for the prevention of unfair competition, and the right for civil servants to establish trade unions and right to collective bargaining without a right to strike has been introduced in 2001. Besides, a Consumer Protection Law was enacted in 2004, establishing a sufficient mechanism and penalties to protect consumers and help create a fair and competitive economic environment, and the disagreements on international public service deals were left out of the duty of the public courts in Turkey. Moreover, the laws on public procurement, public financial management and control, and access to information law were enacted in 2002, 2003, and 2005, respectively, in order to ensure competition, transparency, accountability, and efficiency in the process of public finance and procurement and to provide access to the information about all administrative decisions and actions. Furthermore, there were reforms in the areas of health services and social security and public sector employment, making it easier to use market mechanisms and providers in the delivery of public services and to hire temporary and part-time personnel on contract. Finally, a comprehensive strategy for establishing an e-government system was set up and e-Transformation Turkey Project was adopted to coordinate information society activities.

## Conclusion, an Overall Evaluation, and Policy Implications

The recent state and administrative reforms before 2011 define new parameters for the state and public administration in Turkey mostly within the framework of governance. These reforms had helped to reorganize the powers and functions of the central government and local administrations, and of the state, market, and society. The local administration reforms until 2011 had expanded the responsibilities and powers of local administrations and clarified the limits of central government's power and influence over local administrations. They helped to decentralize the centralist system by establishing some local participative decision and policy making processes and mechanisms and by devolving some administrative and financial powers down to the local and regional administrations. Another major characteristic of these reforms is that they have introduced market principles into service provision processes in the public sector such as privatization, outsourcing, and performance.

However, since 2011, the strong state tradition and centralism seem to have revived due to the AKP government's lure for stronger executive branch and political influence over the judiciary and bureaucracy, low levels of civic democratic culture and participation, and relatively weak democratic structure of political parties. These reasons accompanied by continuing dominance of the center over the local and regional administrations have limited the success of the reforms. Similarly, some reform attempts (i.e., the recognition of the cultural rights of Kurds and Alevis, the establishment of the DAs, or new province-wide metropolitan municipalities) have been considered as harmful to the unitary form of state and steps toward separatism or a form of federalism. For example, the establishment of provincial metropolitan municipalities and the development agencies, as some argue, may be considered to create the risk of separatism, political patronage, and corruption.

Despite claims of a move toward federalism, the creation and implementation of real and

functional participatory and democratic governance processes and mechanisms at the national, regional, and local levels are still needed. The central government still is hesitant to devolve its powers (especially financial) down to local and regional administrations and civic organizations. Besides, on the part of local governments, there is an unwillingness to recruit personnel on a merit-based system. The remnants of the strong statist and centralist tradition and concerns about objective, efficient, and effective use of resources by the local and regional administrations or by civic organizations play a role in this unwillingness. Of course, the inadequate levels or lack of participation and cooperation habits among the local people worsen the problems. Thus, transforming mentalities and thoughts and focusing on successful implementation of the reforms require that the statist, centralist, and hierarchical structures and practices have been changed into a governance structure formed by pluralism, interdependency, and participation. For this purpose, Turkey has to expand the cultural rights of Kurds and Alevis and shift its traditional interpretation of the Turkish nation to a redefined and inclusive notion of political community. After 1 November 2016 elections, the new AKP government has started to work on a plan to meet some of the demands by Alevis.

The AKP governments' political reforms had continued without any major disruptions until 7 June 2015 general elections when the ruling AKP government lost its governing majority and swung toward the use of authoritarian state power to gain majority in the parliament again. However, there has been a slowdown in the speed of and a change in the contents of the administrative and democratic reforms since 2011, when a general election was held. Before this election, the AKP government passed some laws, centralizing some of the ministries and taking back some of the powers previously transferred to the local administrations. For example, the Ministry of Environment and Urbanization is given more discretionary and preemptive powers to regulate and use municipal lands, considered as steps toward more centralized, top-to-bottom, and less participatory and transparent administrative structure, which has increased corruption.

Regarding democratization, there is also a long way for Turkey to go. There are cases of continuing abuses of basic human rights and freedoms, particularly continuing pressures on the freedom of the press, assembly, and speech. Turkey had been ranked first in the appeals to the ECHR for many years, a great majority of whose were verdicts against Turkey for human rights violations, particularly the right to life, freedom from torture, and unlawful imprisonment (ECHR 2014). Yet, the Constitutional Court's new duty to see individual appeals of human rights violations before individual appeals to the ECHR for human rights violations is expected to decrease human rights abuses and thus the number of appeals to the ECHR. Another major problem regarding democratization is related to a majoritarian, rather than pluralistic understanding of democracy. The AKP governments have become more concerned with the Islamization of educational, cultural, and social life in recent years on the base of Sunni Islamist values by enlarging the number of elective religious courses in all secondary and high schools and by other means. Even though the courses are elective, all students are openly encouraged to take these courses as if they were compulsory. Similarly, all the students who are not enrolled in regular schools are redirected to religious schools. Besides, the president's and current AKP government's insistence on a presidential system despite already very strong executive branch and the heavy control of the government over the judiciary leads to concerns that the majoritarian and authoritarian and even totalitarian leanings in the political systems in Turkey will increase. For example, the Human Rights Association asserts that the new law on new security pack enacted in 2015 creates a fear of police state because of an increased discretion of and protections for the police, increased punishment for terror related crimes, etc. Moreover, the emphasis on ethnic and religious aspects may result in a resurgence of extreme manifestations of religious and ethnic primacy in social life and separatist and religious movements. The probability of such threats is higher now due to the influx of refugees from such countries as Syria, Iraq, and Afghanistan. The July 15 Coup Attempt proved

these threats to be real. Now, the most important tasks before Turkey are to establish political stability, and to improve social consensus, moderate politics, pluralist democracy, the rule of law and freedoms.

# State and Local Governmental Accounting in the United States

Odd J. Stalebrink
Public Policy and Administration, School of Public Affairs, Pennsylvania State University, Middletown, PA, USA

## Synonyms

Governmental accounting; Public sector accounting

## Definition

Governmental accounting is the process of recording summarizing, analyzing, and reporting financial transactions incurred by a government.

## Introduction

Similar to private for-profit and not-for-profit organizations, state and local governments in the United States (USA) are required to record financial transactions pertaining to their operations (i.e., governmental accounting). This process involves summarizing, analyzing, and preparing

and releasing an annual financial report. The resulting report is referred to as the comprehensive annual financial report (CAFR) and is prepared with three target audiences in mind, including the (1) citizenry, (2) legislative and oversight bodies, and (3) creditors and investors. Toward this end, the CAFR provides an account of a government's financial performance during a given fiscal year. For state and local governments, such performance information centers on providing the intended users of governmental financial reports with relevant and timely information about (1) whether a reporting government's transactions complies with legislative budget mandates (i.e., whether the government spent appropriated funds in accordance with the adopted budget?), (2) the extent to which it has been living within its means during the given fiscal year (i.e., whether the government was able to cover its expenditures?), and (3) the financial condition/health of the government (i.e., information about the value of a government's assets and liabilities).

Guidance on how state and local governments should account for and report on their financial transactions is provided by the Governmental Accounting Standards Board (GASB). The GASB issues such guidance through the adoption of accounting standards, referred to as generally accepted accounting principles (GAAP). The main goal of these standards is to yield information that assists users in "...making decisions about a government and to assist them in assessing whether it has been accountable for the resources that have been entrusted to it" (GASB 2021). Toward this end, the GASB develops standards aimed at ensuring that governments account for and prepare financial reports that are both relevant and understandable for the intended users of state and local governmental reports (i.e., citizens, creditors and investors, and legislative and oversight bodies). While GASB standards serve as recommendations, the large majority of US state governments have adopted statutes that require state and local governments to comply with GAAP.

Private for-profit and not-for-profit organizations are subject to a different set of GAAP, issued by the Financial Accounting Standards Board (FASB). Although FASB and GASB operate under the auspices of the Financial Accounting Foundation (FAF), the two standard setting authorities operate independently from each other. It should also be noted that the US federal government is subject to yet another set of GAAPs, developed and issued by the Federal Accounting Standards Advisory Board (FASAB). The scope of this chapter is limited to providing an overview of state and local governmental accounting in the USA.

## Key Content of State and Local Governmental Comprehensive Annual Financial Reports (CAFRs)

The key component of state and local government CAFRs is the basic financial statements. These provide information about a reporting government's in- and outflow of economic and financial resources during a fiscal year (i.e., accounting period), and the value of the assets (the entity's productive resources) and liabilities (what the entity owes) that a government holds at the end of the fiscal year. In comparison to private for-profit and not-for-profit organizations, state and local government CAFRs include a larger number of financial statements. The reason for this is that state and local governments serve a broader set of user groups, compared to not-for profits and private firms.

A second important component of state and local government CAFRs is the Management Discussion and Analysis section (MD&A). This section of the CAFR is prepared with laymen audiences in mind. It is written in a manner that allows nonexpert users to extract and comprehend key information presented in the CAFRs (Stalebrink 2019). As indicated by its name, it is prepared by the reporting government's senior financial manager. Given this, it is viewed as an opportunity for management to share their knowledge and insights about a government's financial performance (Stalebrink 2019).

In addition to these two components, the CAFR includes a report from an independent auditor, which comments on whether the basic

financial statements have been prepared in compliance with GAAP and accurately portray the financial performance of the reporting government. Given that the auditor's report only comments on the financial statements, the MD&A lies outside of the scope of the auditor's review. Finally, the CAFR also includes a statistical section that gives the reader access to contextual information, including demographic and statistical trend information. This information is included to help the user better understand the financial performance of the government as it relates to its unique context.

## An Historical Account of State and Local Government Accounting in the United States

Historically, state and local governmental accounting in the USA has primarily been based on a compliance and liquidity-oriented accounting model (CL-model). Under this model, governments account for their activities at a program or fund level, using a cash-based method of accounting, within which financial transactions are accounted for based on the receipt and payment of cash. The primary goal of this model is to ensure compliance with budget mandates and to uphold fiscal accountability (i.e., ensuring that the government is not overspending), by requiring entities to "...(a) present expenditures at a line-item or object level (e.g., supplies, wages, travel, etc.); (b) prepare separate sets of financial statements for each budgetary purpose (i.e., 'fund-accounting'); and (c) recognize financial resource flows based on the receipt or payment of cash (i.e., 'cash-based accounting,' often called modified accrual)" (Sacco and Stalebrink 2010). Given that government entities are not profit seeking, early proponents of this model argued that public sector activities should use an accounting model that allows users to assess how much government units are legally allowed to spend, how they may spend these funds, and whether they are in compliance with budget mandates (Morey 1927).

However, throughout the history of state and local governmental accounting there has been recurring calls for state and local governments to adopt an accounting model conventionally associated with private sector entities. This accounting model, often referred to as the accrual and consolidation model (AC-model), requires entities to account for and report on their activities based on in- and outflow of economic resources (rather than based on the in- and outflow of cash flows) during an accounting period. Moreover, it requires the reporting entity to consolidate all its activities into a single set of entity-wide financial statements (also referred to as whole-of- government financial statements). In contrast to the CL-model, the AC-model also requires the entity to disclose the value of all its short- and long-term asset and liabilities. Given these requirements, the AC-model attempts to provide users with a more complete and accurate picture of whether the reporting entity as a whole has been living within its means during a particular fiscal year (i.e., whether it raised enough resources to cover its economic costs).

In their historical analysis of state and local governmental accounting in the USA, Sacco and Stalebrink (2010) identify three distinct time periods where there has been calls for a particular accounting model. According to the authors, these periods are distinct because of the historical parallels that can be identified across the public and private sectors. They explain: "The progressive period of 1890 to 1920 was a time when governments, similar to private businesses, were looking for greater efficiency. The New York Bureau of Municipal Research and Taylorism were both aimed at improving efficiency via the scientific method. In the mid-century period, the administrative state and centralization of government paralleled the work on vertical integration (Chandler 1977) for the corporate community. The presence of neo-liberalism in the years before the 21st century affected both the government and the private sector. In particular, many in the business community and government wanted institutions such as the World Trade Organization (WTO) (Amsden and Hikino 2000) to facilitate fair trade."

The first time period that Sacco and Stalebrink (2010) identifies favor the adoption of the AC-model. It occurred at the turn of the twentieth century and was driven by the

development of large-scale international capital markets. During this period, progressive organizations, supported by private industry, such as the abovementioned Bureau of Municipal Research, lobbied for the adoption of the AC-model in government.

The second time period favored the CL-model. It began in the depression era and lasted throughout the 1970s and the emergence of the administrative state. Sacco and Stalebrink (2010) explains that the CL-model was favored during this time period, because it allowed more flexibility in borrowing and spending. This flexibility follows from the CL-model's lack of emphasis on providing information about debt, and the lack of information that a fund-based model provides about overall spending and available resources.

In the final time period, which began in the 1980s, there was a renewed interest in the adoption of the AC-model in government contexts. During this time period, the AC-model was not only considered, but also widely adopted on a global scale. These adoptions occurred throughout the 1980s and 1990s. In the USA, this was exemplified by the GASB's adoption of statement #34 (GASB 34) in 1999, which has been regarded as the most significant change in the history of US state and local governmental accounting (Patton and Freeman 2005).

## GASB 34 and Beyond

Consistent with the AC-model, the adoption of GASB 34 required state and local governments to account for and report on their activities at a government-wide level, using the accrual basis of accounting. The overarching goal of the changes was to increase the relevance and understandability of the information presented in the CAFR to the intended users of the reports (Stalebrink 2019). However, in contrast to most other countries that adopted the use of the AC-model for its governments, the USA adopted a model that combined the two models. This dual approach was adopted on grounds that it would better serve the diverse information needs of the intended users of the reports. The resulting dual model includes a model centered on providing information about current financial resources at the fund level and a model centered on providing information about economic resources at an entity wide level.

Since the adoption of GASB 34, GASB has issued more than 40 additional statements aimed at further improving the relevance and usefulness of state and local government CAFRs. Among other things these standards have centered on improving accounting and reporting on significant items such as derivative instruments (Statement 64), pensions (GASB 67/68) and other post-employment benefits (GASB 74/75). Efforts to improve state and local government accounting will continue as changes occur in the state and local government reporting environment and as new methods and opportunities to improve accounting and reporting emerges.

## Synonyms

Community policing; Decentralized security system; Local policing; Neighborhood watch; Non-state security actors; Paramilitary organizations; Security governance; Self-help Institutions; Vigilante groups

## Definition

Vigilantism: the informal mobilization of voluntary civilians to form policing team for the purpose of ensuring societal control and ordering; it involves partnerships, collaboration, and collective strategies for fighting crime and related vices at community level; it is a community-based approach in crime prevention, and protection of lives and properties; it is the involvement of local stakeholders, able-bodied civilians, community leaders, clergymen, market associations, and religious organizations in the security architecture for the purpose of ensuring lasting peace, sustainable security, and effective social order and control.

Community policing is concerned with joint efforts and ardent partnership of both the people and the police in the quest of safeguarding properties and lives at the level of neighborhoods (Ordu and Nnam 2017).

It is an ideology that propagates organized strategies that favor the systematic adoption of problem-solving techniques and partnership, which pragmatically address the immediate circumstances that result in safety issues of the public in form of social disorder, fear of crime, and crime (Okafor and Aniche 2018).

## Introduction

The mobilization of informal mechanism of policing has become increasingly fashionable, and in many countries, they assume large roles in their security architecture (Basiru and Olusesan 2019; Akani et al. 2020). The renewed interest in this security space calls for a more serious investigation in the direction. It represents an upsurge of primordially existent security mechanism in communities which has undergone conceptual modifications and operational transformations. A community constitutes either a rural and an urban area, while the former is the rustic, agrarian countryside usually associated with relatively lower population, lower income, and homogeneous and agricultural economy; the latter is characterized by relatively higher population density, higher income, and heterogeneous and industrial economy associated with cities and towns (Okafor and Aniche 2018). The rural or local communities appear to be a highly unreached group in the security distribution. Therefore, high tendency of informal security formation takes roots in these seemingly unreached communities (Nwokolo 2020), due to their vulnerability to criminal activities and related issues. However, because social problems erode boundaries, formation of vigilante group has become pervasive across different geographical distributions and areas.

The need of maintaining social order and organized lifestyle in the society necessitates social control and formal policing measures by the state in form of national police force. The primacy and contingency of security in governance is incontestable (Tyoden 2006) and is demanded in both developed and developing states (Ojo et al. 2019). However, informal policing becomes imperative in countries where the police service is seen as nonserious, inadequate, lacking, and politicized (Amnesty International Worldwide 2013). Ekeh (2002), for example, observed that with obvious lack of faith in the police, Nigerian communities do not rely on them but outsource or

resort to unregulated and violent reprisal against suspected sources of their collective endangerment. It becomes more pressing to employ this security architecture where there is unavoidable interplay of dynamics of social reality and disorder. Crime, for example, is an inevitable aspect of social reality. Hence, "criminality, though a negative phenomenon is a necessary part of every society" (Onwuegbusi 2017 p. 74) and cannot be extinguished from the same (Siegel 2008). Ugwuoke (2010) noted that it commands attention of all people and is interwoven with the society. Again, crime is observed as a social product that is caused by social conditions that is subject to control only in social terms (Durkheim, 1933, quoted in Onwuegbusi 2017). As for the case with Nigeria, crime trend has always been in an increasing frequency (Tyoden 2006).

Moreover, criminal activities are most likely visible in the neighborhood, and by implication there is need for their cooperation and support (Ordu and Nnam 2017). Criminal activities have been ravaging Nigerian communities for a long period of time, and this has been followed by proliferation of vigilante groups as formal policing measures appeared failing. In Ebonyi State, each community or villages in the local governments have vigilante groups or neighborhood watch teams. These oversea security issues in these communities. Some of them serve as a team of warriors and war lords who defend their host communities in communal conflict situations and can also be deployed as mercenaries to other communities during crisis. The recent surge of insecurity in the South East and Ebonyi State in particular has been greeted with state-sponsored vigilante groups. Hence, in this entry, we seek to examine the effectiveness of local policing and vigilante operations in Ebonyi State and Nigeria in general. First, we situate local policing in Africa and Nigeria in particular and locate its historical contexts. Second, we evaluate state and vigilantism to trace the experiences and the contradictions inherent in the practices. Next, we explore global perspective, justification, and practice of community policing. Further, we reexamine the experiences of vigilante operations in Nigeria whether it is a worthy option or an obnoxious ideology and practice, and finally, the conclusion follows, which stakes our eventual positions and recommendations.

## African Communities' Policing Regimes and Historicity

Community policing is older than Nigeria (Pratten 2008), and claims age positions with primordial and precolonial societies of the current colonial contraption. In every society of all time, there has always been a community life. Social order has always been the purpose of social organizations, and politics has, more often than not, been the instrument.

African society is identical with community life, encumbered by ethnic fragmentations and density of tribes. Prior to colonial experience, these communities have experienced peace and tranquility not because there was no crime or conflicts, but the rate was minimal and under effective communal control and policing. Criminals, offenders, and the good and the bad were all members of the local community, and the eyes of everyone were upon everyone. Hence, everyone treaded with care and succumbed to prevailing mutual social order of the time. Alemika and Chukwuma (2003) affirm that Vigilante groups' commitment and effectiveness was benched on their members being drawn from the same community and their shared interest in community security as well as their subjection to accountability and control by the same community. Community control was a role ascribed to all members of the precolonial Igbo society in Nigeria, as it was a responsibility of every adult male who were either members of age grade, masquerade society, or both (Okafor and Aniche, 2018; Onwuegbusi, 2017). Crime control and social life ordering were within the powers and responsibility of "indigenous social institutions and groups" (Onwuegbusi, 2017, p. 74).

Precolonial societies in the current geographical Nigeria have rich history of community-policing experiences. These societies utilized "self-help institutions" as we know today as vigilantism (Basiru and Olusesan 2019). There

existed "Ndiche" in Igbo land, "Olodes" (hunter guild) and the "Ian banga" among the Yoruba and Hausa-Fulani, respectively (ibid, 2019, p. 184). However, the adventure of colonialism distorted the African policing model and eventually dismantled and replaced it with colonial police (Onwuegbusi 2017). As scholars have noted, the new system was antipeople and proelite as it only tended toward protection of colonial masters' interests (Alemika and Chukwuma 2000; Rotimi 2001; Okafor 2006; Ikuteyijo 2009). It was this distortion and dismantling that created a dichotomy between the people and their rulers and increased enmity rather than amicability. Rightly, Rotimi (2001) pointed thus, the colonial police was a kind of strangers policing strangers. The later experience of the postcolonial era became a carryover of the colonial experience (Onwuegbusi 2017). Hence, the perpetuation of the prevailing order.

Nevertheless, some communities in Nigeria that have long history of communal conflicts and crisis still retained their security outfits. These exist as primordial heritage and embedded with cultural values of the people. They represent epitome of ancient historical conquests and celebrated victories and memorable losses. As communal crisis is a protracted case in Nigerian communities even in this current dispensation, these security outfits, which serve as community warriors, are often deployed to fight in crisis situations. One of the instigating factors for community crisis is the presence of warriors and warlords, which increase their morale to engage in combats. Though emphasis is on procedural factors here, it is not to deny that there are substantial factors that cause communal conflict, which is a subject of another research engagement. The kind of local military system employs two strategies: standing warriors and reserve warriors. Reserve warriors are dormant and can only be mobilized during an intense crisis situation while standing warriors are those who are in active service. The later are carriers of constantly rising community security burdens. They engage in day-to-day community policing. These have for so long engaged in active service from primordial African societies up till the current dispensation. The force is usually renewed and updated by periodic conscription of able-bodied men and highly spirited voluntary individuals in the communities. It is instructive to note that this system is operational in most local communities and is rare in urban ones. References can be made to communal conflicts in Ebonyi State recently namely, Ikwo (Nnoyo) and Izzi (Nweze) crisis 2021; Ezza and Effium conflict 2020/2021; and the protracted interstate, Ngbo (in Ebonyi State) and Igala (Benue State) boundary disputes 2021. These crises were not just starting by these dates, rather they are resurgence of existing unsettled or unadequately resolved conflicts. The community security or warriors are usually deployed to fight in these armed conflict situations between communities.

## The State and Vigilantism

The concept of state involvement in vigilantism is a contradiction and an indication of some silent facts. The state as an architect of formal mechanisms of policing maintains sole legitimacy of organized mobilization of forces for territorial and endogenous security. The state utilizes national police for safeguarding lives, properties, and maintenance of internal decorum. The state police were conceived as its instrument that serves its interests (Onwuegbusi 2017). Also, the formal policing mechanism was accused of partisan activities and politicization (Ikuteyijo 2009). This author further notes that the police instead of serving the masses were found as an instrument of oppression.

Moreover, the complications of societal issues and problems have also contributed to the brutal nature of the Nigerian police where they resort to mobilizing deadly weapons against perceived criminals. Nevertheless, this disposition exposes both the innocent and the real offenders to harsh treatments. Thus, the legitimacy of the police among the people becomes contestable in this kind of atmosphere.

The unhealthy relationship of the formal policing mechanism with the mainstream communities of people alludes to the colonial police

experience. The colonial police as has been established before now in this entry were used as instrument for serving the interest of their masters. All the same, the current police were just a transition of the former with its ideology, strategies, and management style. The state elites are seen as subjects of protection rather than the people. This stance causes constant rift between the people and the formal security architecture. Whereas scholars have agreed that incompetence of the mainstream security forces in carrying out their role has resulted to formation of alternative means (Basiru and Olusesan 2019), lack of trust and continual rift between them and the people also lead to the same drive.

The dynamism of the Nigeria configuration and interplay of political forces complicate vigilantism. Nigeria is a highly ethnicized community of people (Idike et al. 2019), and identification with the state as a whole in practice is not on the basis of individual citizenship but on the tribal whole. So, each tribe or ethnic group on the whole identifies with the country not the individual members of these tribes and ethnic groups, thereby representing the state-citizen relationship on tribal/ethnic level. This explains the existent and current formation of vigilante groups by various states that represent tribal or ethnic residents and uniformity. This also alludes to the incongruity among peoples of Nigeria and why unity has remained contestable since her political independence till date.

Southeastern Nigeria which is predominantly Igbo societies has been having protracted feeling of alienation from the national scheme of things (Ojo and Lamidi 2018; Idike et al. 2019), including adequate and reliable security services. This serves as one of the motivating factors of the state-sponsored vigilante groups in the Southeast coupled with internal security issues and crimes. The formation and mobilization of Ebubeagu Security outfit in the whole Southeast attest to this allusion. The encroachment of armed herdsmen and "unknown gunmen" in the region among other reasons has motivated the five states to inaugurate the states-sponsored vigilante group known as Ebubeagu. This security outfit is traceable to April 11, 2021, South-East Security Summit in Owerri, Imo State, where consensus for its formation was reached (BBC Login 2021a).

Ebonyi State, in particular under the leadership of Governor David Nweze Umahi, launched Ebubeagu vigilante group. The state security council also agreed to form what they called "Joint Youth Vigilante Committee" for all the communities that have experienced communal crisis (BBC Pigin 2021b). The distribution of Ebubeagu security personnel in the state is as follows: The total personnel is 2000; while 200 go for each 13 local governments, the rest were allocated to the capital city (BBC Pigin 2021b). There was the approved recruitment of commanders for each local government of the state. The recruitment process involved the Police officials, Department of State Security Service, traditional rulers, and Christian organizations. Though Ebubeagu is an armed security outfit, they were charged to detain no offender but were tasked to collaborate with the state police for information sharing and collective war against crime and associated armed attacks.

State-sponsored vigilantism is not novel in the Southeast. About more than two decades ago, there was the reign of Bakassi Boys formed by market traders and later sponsored by Anambra State to fight crime which later turned to a dreaded group that was proscribed by the Federal Government in 2001 (Basiru and Olusesan 2019). The same author observed similar formation in South West where O'Odua People's Congress (OPC) was formed in Mushin, Lagos State, to protect the interest of the Yoruba people. It later turned into a Vigilante group for the rate of crime in the host community. The group was later attributed with some inconsistent behaviors as was the case with Bakassi Boys.

Linkage of the state, with vigilantism that raises constitutional concerns as its stipulation that no parallel security force or operation should be created outside the police force and the army, has been eroded (Amnesty International Worldwide 2002). So, the interest of the state in vigilantism outside the formal security forces is an area that seeks serious research attention which may not be covered here. It can be assumed that the state has come to the understanding that policing

local communities cannot be effective through using of aliens in such communities. Also, it can be argued that mobilization of state-sponsored vigilante groups could be to drive the unlimited interests of incumbent leaders and other elites in the state who can use this medium to achieve some unpopular ends. Mobilizing new security outfit when there is an existing one could be seen as security governance contradiction or confusion.

## Community Policing and Global Perception, Perspective, and Practices

Current governance debates have favored people-oriented approaches. Security governance draws global attention as local rifts can actually trigger global impacts. The vandalization of oil pipeline in Nigeria caused or contributed to global oil fluctuations, which is an indication of the truism. This is why countries are keen over internal issues and security disruption of other countries. Notwithstanding, global policing regime experienced transition from the traditional to formalized and systematic community policing (Okiro 2007). As observed, it espouses democratic value of popular participation and collaborative efforts (Aniche 2018). Moreover, it has been recognized that maintenance of internal consistency of security and decorum demands engagement of the local people who are also the targets of security.

Great powers of the world have recognized this model of security governance including United States of America. Community policing is traceable to the USA in the 1970s where it was observed that neighborhood and individuals were capable of contributing to their security (Carney 1977). In the fact sheet of US security assistance policy, nonstate paramilitary organizations were recognized (see Obama White House Archives 2013). This implies that nonstate security outfit is not just for weak states. In tandem, Nwokolo (2020) has argued that nonstate security serves as a complement to existing state security strive in either succeeding states or failing states.

## Is Vigilantism a Worthy Option? Reexamining the Experiences

Cross-examination of vigilantism in Nigeria produces mixed results. This is given to the fact that various vigilante groups differ; while some are well organized with defined structures and roles, others are not (Ogbozor 2018). Therefore, some conceive vigilantism as illegal while others contest the opinion (Rosenbaum and Sederberg 1974). Peeler (2019), for example, insists that vigilantism should not be seen as illegal and criminal. Rather, the activities of the group lead to a reasonable crime control (Onwuegbusi 2017).

However, Basiru and Olusesan (2019) have submitted that a critical examination of vigilante groups balance sheet in the context of democratizing Nigeria shows that the groups rarely subject their activities and subsume them under the state order and law requirements. By implication, in a democratizing Nigeria, vigilantism has become an instrument of threat, intimidation, and other antisocial and political influences. Ordu and Nnam (2017) admit that community-policing agents tend to fall into being corrupted by the community when it is under their control. Carter (2002) agrees with this and further noted that the scenario makes community-policing agents to connive at the corrupt activities of the community. Okafor and Aniche (2018) in line with the above stance reveal that vigilantism has not created positive impact. To them, it has rather orchestrated insecurity and ridiculed development efforts in the communities.

The accountability system of Vigilantism is very weak, and compounding the whole situation, there is no defined or outlined principle/guideline on relationship with external monitoring agents (Ogbozor 2018). Quest for monetary benefits makes the group to divert from their original goal of community policing to some unpopular ends (Umeagbalasi 2012). Vividly, Laurent Fourchard painted the picture of vigilante groups that they protect lives and properties, defend ethnic groups, and work as thugs on behalf of elite political leaders (2008). It has been reported too that killings, unlawful detention, degrading and inhuman treatment of

citizens, and torture are attributed to vigilante groups (Amnesty International Worldwide 2013). Vigilante groups were formerly praised for recompensing to criminals their evil, but later, the people became disappointed and now fear because they also maltreat innocent groups (Elechi 2003). The foregoing is similar to the case in Mexico, where vigilante groups that were helping in preventing drug trafficking and kidnapping later engaged in the same (Knowland 2014). Scholars are concerned about many issues relating to the vigilante groups. These concerns were harmoniously raised by Onwuegbusi (2017) on the following areas:

Character of vigilante members
The manner of admission of members
The training they receive
The remuneration and upkeep
The power relationship between the members and the citizens
Allegiance to the authority
Level of cooperation between the groups and the conventional security forces of the state

Ogbozor (2018) observed that many vigilante groups are not trained or adequately trained on the law of the state and how to operate in their duty as security of the state. Lack of adequate remuneration leaves the vigilante groups to temptations (Alemika and Chukwuma 2003). They relied on charms and voodoo as alternative to absence of adequate arms and requisite training (Adejoh 2013).

A classification of vigilante groups made by Alemika and Chukwuma (2004, p. 3) helps to shade more light on the whole subject and its practice. They classified vigilante groups into the following:

Neighborhood or community: neighborhood watch and community vigilante groups organized by community associations.
Ethnic: vigilante groups organized along ethnic lines to defend ethnic interests.
Religious: vigilante groups with faith roots.
State-sponsored: These vigilante groups operate with both or either legal or financial support.

Vigilantism has no doubt received both approval and disapproval from varied sources. Notwithstanding the challenges, the people still exercise confidence on them as local and Indigenous security outfits and as an alternative to the failed/failing mainstream security system (Nwokolo 2020). Also, the people's preference of the security system rests on their quick response, readiness to service and effectiveness, and community presence as opposed to absence of state security outfits in remote communities when security needs arise.

## Understanding the Nature of Governance in Nigeria Political Economy

Both theoretical and empirical researches have been undertaken on governance and security situation in Nigerian democracy in recent years. Early research focused on defining the concept of security, democracy, principles, challenges, and strategies for good governance (Imobighe 1990). Thus, effective governance is one that is characterized by accountability, transparency in the management of public resources, rule of law in the conduct of public affairs, predictability of institutional performance and behavior, justice and equity and effectiveness in the management of economy, and the impact it has on the citizens (Ibodje 2012; Okpata and Ukeje 2017; Idike et al. 2020; Ukeje et al. 2020). These characteristics of good governance are also the elements constituting the environments for economic development. Here comes the problem of national development in Nigeria, which environment has not encouraged the flourishing of the above elements of good governance as a result of differing opinions, regarding the priorities accorded to those policy objectives. In fact, there is an even greater divergence of views on the means by which such objectives can be actualized (Olawunmi and Ayinla 2007).

World over, governance remains one of the major machineries through which the society is placed at global perspective. Ngboawaji (2011) asserts that the world is not peaceful as a result of so many security-related threats and

challenges. But it is difficult to admit that governance is involved anywhere in the world without its attended problems. Consequent upon this, when values and ethics of a particular society/nation is eroded as a result of ill-governance, it usually reflect on the economy of the country. Insecurity springs from the background laid by the contesting issues. National security is now being perceived as total security – cutting across the security of life and property, security of the economy and the economic resource areas of the country, security of food and raw materials resources, of general health of the people, of environment, and of national integrity, and preservation of all that society considers to be important and valuable (Imobighe 2000 cited in Ngboawaji 2011). Thus, the inability of African leaders to take leadership challenges as it were in western countries like the USA is one of the reason why we are quarantined whenever global governance assessments are instituted to review activities of countries of the world having in mind that Nigeria is the epicenter of the third world countries where insecurity, disregard for values, and disfigured ethics and neglect for rule of law and principles of the democratic system are sent into albeit for the interest of politicians that are bent on destroying the image of the country for their own selfish interest.

No region/zone in Nigeria is sleeping with their two eyes closed due to crises that are either politically motivated or systematically motivated. In the eastern region to be précise, security threats are recorded on a daily basis mostly as they are related to activities of our leaders that are in one political position or the other whose interest should have been on how to impact positively on the economy which in other hands will predispose empowering the citizens for peaceful coexistence but is now turned to target citizens that are at the receiving end of small and light weapons that are circulated by politicians in pursuance of their political ambitions. For example, this scenario has led to "endsars" and "end bad governance" protests including breaking into government warehouses to reclaim palliatives supposedly meant for citizens but being hoarded by the leadership for no tangible reason (Onele et al. 2021).

Adejumo (2011) asserted that governance/government institutions all over the world are accountable for the security of their countries and face the same challenges of insecurity within their borders on a daily basis. Tyoden (2006) observes that despite the fact that security is a primary responsibility for any government to develop, it is not given the attention it much needs in Nigerian democratic government.

Notably, the obligation of the state to ensure the safety and well-being of the citizens is enshrined in sect. 14 (1) of 1999 Constitution, and it states that:

> The Federal Republic of Nigeria shall be a State based on the principles of democracy and social justice and that the security and welfare of the people shall be a primary purpose of government.

By vesting in the state this power, Thomas Hobbes argues that the citizens or nationals have entered into a social contract with the state to protect them in exchange for its monopoly and control over all instruments of force and violence. The assumption of the contract here emphasizes that in the state of nature, everyone has the right to everything – there are no limits to the right of natural liberty. The social contract is the agreement by which individuals mutually transfer their natural right. Hobbes notes that we do not make these agreements explicitly because we are born into a civil society with laws and conventions (i.e., contracts) already in place. This implies adopting a state-human-centered approach that is anchored in preserving order and avoiding life-threatening violence of any kind in a democratic setting (Onoja 2013).

Thus, traces of injustice, discriminations, and inequality in economic empowerment programs by the poor in various communities and regions of the state have been a serious challenge to governance in Nigerian federal structure, and this has resulted in several agitations for state creation, revenue generation and control, and equal participation of all in the management of our common resources. Unemployment, political instability, faulty electoral system, bloated bureaucratic corruption, faulty institutional framework, weak state, insecurity, increase in crime wave, and

Boko Haram insurgence point to failings in Nigeria's federalization processes as a result of the faulty framework of governance on which Nigeria's federal structure rests.

Thus, considering the above instances, it is worthy of note that ill-governance remains the brain behind the economic ordeals of our nation today that have metamorphosed into what is popularly known as insurgency, terrorism, Boko haram, etc. that have breached in a strong term the societal ethics and values which promote political economy.

Thus, Albinus (2012) argued that the abysmal failure of successive administration in Nigeria to address challenges of poverty, unemployment, and inequitable distribution of wealth, among ethnic nationalities, ultimately resulted to anger, agitation, and violent crimes against the Nigerian state by some individuals and groups. Such crimes include militancy, kidnapping, bombing, armed robbery, and destruction of government property, among others. This problem has the damaging consequence of giving the signal to the rest of the international community that Nigeria is not a safe and secure place and as such not suitable for economic investment and activities. Good governance is therefore the ability of the government to live up to the expectations of the people and meet the needs of the generality of the citizens (Omololu 2006). Tyoden (2006) asserts that security has to do with the readiness and capability of a country to contain internal and external threats to its existence and well-being (the military dimension), and ensure the socioeconomic welfare of its peoples (the developmental dimension). For an understanding of the effectiveness of the developmental dimension of human security and governance policy direction, see: Ukeje and Chukwuemeka 2021, Idike et al. 2020. Thus, peace and security (socioeconomic) can also be achieved through stronger regulations and the institutionalization of public service charters and that which enhances citizens-state interactions (Ukeje et al. 2019), hence the need to work together to produce the desired public value. This no doubt will help in the course of achieving a kind of state-citizen interaction that has implication not only for scaling-up the governance ratings of the government but also for the overall reforms that improve the conditions under which the street-level bureaucrats do their jobs in social services provisioning (Ukeje et al. 2021).

## Conclusion

Though shortcomings and limitations have been attributed to the activities of the vigilante groups in the state, there is support by the citizens for a crime-free society (Onwuegbusi 2017). Residents of Ebonyi strongly support policing of communities (Ndukwe 2018). Remote communities find solace in and feel at home with local policing agents who are Indigenous people. Local vigilante groups tend to perform better and stick to their goals based on shared interest of community policing. These often volunteer to serve as night watchmen without pay. Some were victims of insecurity or related to a victim. The system survives and thrives in local communities due to the size of these communities. Small communities have apparent characteristics such as strong leadership, knowledge of members' identities and that of families, mutual solidarity, and communal living. Vigilante groups of this kind of community hardly go contrary to mutual goals and interests of the community. However, the opposite is the case with vigilante groups in townships and cities where mechanical solidarity thrives. Individualistic life that characterizes urban areas hinders mutual interests and passion for the common good. As a no man's land, urban life is highly personalized and monetized to make ends meet, earn a living, and ensure survival along with other competitive citizens. City vigilante groups are highly vulnerable to manipulation by wealthy people who use them as instruments of vengeance on their perceived enemies. They are also at the disposal of crude politicians and other elite groups. Most of the history of failed vigilante groups can be traced to urban origins and operational spheres. Vigilantism survives in its natural environment. Assigning of vigilante groups away from their original locations and Indigenous environments exposes them to opposition in the host community and invites negative reaction from

them. Vigilante groups are necessary in most highly unreached rural communities as mainstream police force is usually limited in number and capacity to attend to these communities. Self-help becomes an alternative to the shortcomings and challenges of state security gap. By and large, the ideology of local policing enjoys popular acceptance, but their challenges in operation and external pressures and manipulations lead to diversion of their golden goals and values.

## Synonyms

Budget Process; Budgeting Process; Public Budget

## Introduction

Public budget articulates the objectives of the government. It is the translation of the government's plans in which citizens' aspirations and priorities are reflected. Budget cannot be perceived as a technical document; however, it is imperative to understand its multifaceted dimensions. The economic dimension of the budget stems from its effect on economic growth through productive expenditures that focus on boosting the productivity of physical and human capital. This can be presented in expenditures on education, health, and infrastructure (Idrisov and Sinelnikov-Murylev 2013). The legal dimension of the budget is represented in the legal framework that governs the budgeting process, while the political dimension can be illuminated in the dynamics of the decision-making process regarding the allocation of resources, where different actors are involved.

After 2011, Egypt witnessed a political turbulence, which adversely affected the economic conditions of the country and led to a deplorable social situation. As a consequence, the budget deficit increased from 10.6% of the GDP in the 2012 to reach 13.7% in the 2013 with decline in 2014 to reach 12.8% of the GDP (MoF 2015). Such situation led a quite broad segment of citizens to direct their attention to the State budget and the extent of its efficiency and effectiveness in meeting their needs and priorities.

Citizens' aspirations for better lives, services, more transparency, and accountability led the government to resort to undertake a reform program in 2014 with the aim of enhancing the social and economic conditions as well as improving business climate. The reform program includes reducing energy subsidies, reviewing and adopting new laws and regulations to stimulate investments, enhancing governance, and building the capacity of government's institutions.

Furthermore, the efforts of the government boosted Egypt's rank in the Open Budget Survey, which measures the transparency and participation in the budget process. Egypt score hiked from 13 and 16 points in 2012 and 2015, respectively, to reach 41 in 2017 (IBP 2012, 2015, 2017). However, it should be highlighted that the existence of the Parliament and the improvements in budget documents due to the conditions of the International Monetary Fund are the main drivers to the increase of Egypt's score in the Open Budget Survey.

Yet, the price increases due to inflationary pressure remains a challenge, which requires the government to exert more efforts to overcome the various entanglements in order to achieve lower levels of economic inequality and higher economic growth. Budget is a key to realize these needs. Hence, the efficiency, effectiveness, and degree of control over each budget phase are imperative. This paper sheds the light on the budget cycle in Egypt. It provides an overview on the key actors involved and the challenges encountering each phase.

## Budget Process in Egypt

Usually, the budget cycle has four main phases: formulation, discussion and approval, implementation, and audit. The budget process in Egypt is governed by the State's General Budget Law No. 53/1973 and its amendments by Law No. 87/2005. There are different actors involved in the budget process in Egypt. Each actor has specific role and responsibilities that contribute to

facilitate the budget process. The following section explains each budget phase.

### Budget Formulation

Budget formulation is the process that witnesses the dynamics of decision-making and the trade-offs between different actors in order to allocate resources to achieve certain goals. Therefore, this process represents the cornerstone for reform, as enhancing the allocation of resources leads to meet citizens' needs and contributes to close the trust gap between government and citizens.

The State budget in Egypt has two main aspects shaping the formulation process. First, the State budget is of line-item type that focuses on outputs rather than outcomes. The allocation of resources based on line-item budget leads to poor results and has drawbacks on achieving the predetermined goals and objectives (Schiavo-Campo 2007). The line-item budget negatively affects the efficiency and effectiveness of the budget performance, as it is not connected with specific objectives.

Second, Egypt has a dual-budget system in which the Ministry of Finance (MoF) is responsible for the recurrent budget and the Ministry of Planning, Monitoring and Administrative Reform (MoPMAR) is responsible for the investment budget. The budget separation may lead to some tensions not only between the main two ministries but also in the line ministries as well (Schiavo-Campo 2007; Sarraf 2005). This dual system burdens the budget authorities with the negotiations between two entities, as well as it resulted in the lack of link between the consequences of fiscal changes in the investment budget with the recurrent budget, which weakens the oversight of the legislature, as they do not have an overall picture of the effect of medium-term investment (Allen et al. 2004).

In Egypt, the budget formulation process starts with issuing the budget circular by MoF, which includes all the guidelines and standards that should be followed by the budget authorities. Consequently, these agencies start to prepare their budgets and send the budget proposal to MoF and a copy of the investment chapter to MoPMAR. Additionally, budget authorities should send a copy of the wages and compensations chapter to the Central Agency for Organization and Administration (CAOA). This agency, according to its establishment Law No. 118/1964, is responsible for proposing wage, emolument, and compensation policies, as well as studying the proposed budgets pertaining to public service employees. Furthermore, the law states the role of CAOA in reviewing the proposed budgets before its submission to MoF. However, most of budget authorities do not enforce the law, as they do not send the proposals to CAOA.

After receiving the budget proposals, MoF starts a process of studying the proposals for discussion. Consequently, MoF Negotiates and discusses with budget authorities the budget in light of the expenditures of the previous year, the mandates of the spending agency, and some indicators such as the inflation rate.

In terms of the investment chapter negotiations, MoPMAR discusses the budget with the budget authorities with the absence of MoF representatives. Subsequently, both MoF and MoPMAR agree on the total envelope for the investment chapter (USAID 2012).

It should be highlighted that the budget circular does not provide budget ceiling. This means that budget authorities are not bounded with specific amount to prepare their budgets. With the lack of budget ceiling, budget authorities tend to exaggerate in their proposed budgets to be more of "wish lists" rather than well-prepared proposals, which in turn affect the effectiveness of the budget. Ironically, the budget authorities are aware that they will be subject to severe cuts by MoF in the negotiations process (European Commission and World Bank 2009; World Bank 2005; USAID 2012; Allen et al. 2004; El Husseiny 2016).

The public administration system in Egypt is complex, which in turn complicates the negotiation process. For instance, the great number of budget authorities complicates the negotiation process between MoF and MoPMAR from one hand and budget authorities from the other hand (A 'Spending Unit' is any public entity that is responsible for formulating its own budget, while a 'Budget Authority' has the authority to negotiate with the relevant ministries on their

allocations.). Additionally, it negatively affects the budgeting process and contributes to the absence of the concept of sectoral budgets since a sector's budget will be fragmented among different budget authorities.

Incontrovertibly, the power of those in charge of the budget authorities and their capability to negotiate with MoF to attain their needs are imperative to decide on the allocation of resources. Some of these agencies obtain their power from the leadership of the country, which set them in favorable position when deciding on their budgets despite their real needs. Such behavior emphasizes on that the power relations govern the decisions over the allocation of resources.

Moreover, the centralized system affects to a great extent the allocation of resources at the local level, especially with the tension between both central and local levels. Line ministries prepare their budgets in isolation from the local ones. According to El Husseiny (2016), line ministries are not always involved in the negotiations between governorates and MoF. Hence, there is lack of integration between budgets, which negatively impact achieving the overall objectives of the budget.

As a consequence, the negotiations on both recurrent and investment budgets end with an agreed upon preliminary proposal of the spending agency. The MoF submits the proposed budget to the Cabinet for discussion and then the President submits the final draft to the Parliament for discussion and approval.

### Budget Discussion and Approval

The parliamentarian ex ante scrutiny over the budgetary process is manifested in the discussion stage, as the Parliament tends to guarantee that the proposed budget by the executive branch is in accordance with the socioeconomic plan to meet the citizens' needs and demands (Abdullatif n.d.). After receiving the proposed budget, the Planning and Budget Committee (PBC) discusses it with the other sectoral committees in the Parliament. PBC negotiates with the MoF and requests clarifications. Additionally, other sectoral committees might negotiate with MoF on the allocated budgets for the concerned sectors.

The World Bank (2008) emphasized on that the PBC and the parliament officials both lack capacity. However, the current PBC members have various backgrounds such as commerce and taxes. Yet, it is vital to note that the budget document is complex and needs time to understand. This necessitates providing parliamentarians with the needed support to understand the budget.

Furthermore, the current PBC used to assert its regular follow-up on the government pertaining to the implementation of certain key issues such as the transformation toward program-based budget. Recently, the report of PBC on the budget of FY 20018/2019 submitted by the government was released. The report included some recommendations to the executive branch concerning reducing the budget deficit. The recommendations encompassed the completion of the transformation toward program-based budget and the exploration of alternatives for financing public projects, such as water and roads, and reforming the tax system (Salem 2018).

Subsequently, the BPC presents its final report to the general session of the Parliament for discussion. The Parliament has the right to adopt, reject, or amend the proposed budget. Afterward, the Parliament members discuss and amend the budget proposal in accordance with the law and constitution. After reaching final agreement, the Parliament adopts the budget and issues the Budget Law.

### Budget Implementation and Audit

Once the Parliament adopted the budget, all budget authorities start with the implementation phase. One of the main concerns on the budget implementation is that the State budget is subject to deviation from the projected numbers. Transfers to the previously allocated budget are commonly used during the implementation phase. The State's General Budget Law grants transfers within the same chapter in the same entity or within the same chapter between two entities, given specified limits. The MoF approves the transfers submitted by budget authorities. The main goal of these transfers was to ensure flexibility; however, they became a norm. Obviously, transfers represent an indication of the weakness

in the budget planning process. Additionally, the increased number of transfers shows the limited capacity of the Economic Forecasts Unit within the MOF.

Since 2014, the MoF is working on fiscal reform in order to enhance the public financial management to promote accountability, transparency, efficiency, and effectiveness, which are among the conditions of International Monetary Fund's loan to Egypt. Recently, the MoF launched the Government Financial Management Information System (GFMIS) with the aim of promoting accountability in implementing the State budget, controlling government spending, following up on the financial flows, and enhancing transparency and detecting irregularities in the financial system. The GFMIS would help the different administrative bodies to achieve their intended goals efficiently and effectively (MoF 2018). Introducing GFMIS by MoF is considered a positive step that would contribute to overcoming the budget implementation process. Yet, the results of its implementation remain unclear.

In terms of the audit process, the Central Audit Organization (CAO) represents the external audit body that is responsible for following up on the plan's implementation and detecting financial violations. The State General Budget Law stresses on the role of the CAO, which should provide MoF with its comments regularly on the budget implementation. Additionally, CAO should submit its report on the final account to the Parliament. The Parliament uses this report to hold the government accountable for any deviation or exploitation. However, CAO's report is usually delayed and when submitted the information is in most cases repetitive, which leads the Parliament to deal with CAO's report as a routine rather than an accountability tool. Furthermore, despite the fact that the constitution grants the disclosure of information, CAO reports are not published or disseminated to public. This could be a result of the perception of the government and Parliament of dealing with such reports as classified documents (World Bank 2008).

Regularly, governments tend to establish internal audit functions to detect the financial irregularities and misappropriations such as fraud in order to ensure effective financial performance (Association of Certified Fraud Examiners 2014). While internal audit plays a crucial role in the budget in many countries, Egypt does not have an internal audit system. However, it should be highlighted that the Egyptian government declared its intention to establish internal audit units in all ministries as part of its public administration reform agenda.

## Conclusion

Presumably, the State budget cycle in Egypt encounters numerous challenges that adversely affect the overall budget performance and, consequently, impact the achievement of economic and social goals. The need for structural changes in the budget is salient. Some transformations are needed in terms of continuing the shift toward performance-based budget, in addition to repealing the dual-budget system. Additionally, strengthening the accountability mechanism through capacitating the PBC and establishing the internal audit system is required to contribute to improving the budget process.

The bundle of reforms programs introduced by the Egyptian government cannot be neglected. The adoption of GFMIS and the intention of establishing internal audit function are considered positive steps toward enhancing budget process. However, the adequacy of implementing these efforts remains questionable.

# State Budgeting Practices

Vincent Reitano
Western Michigan University, Kalamazoo, MI, USA

## Synonyms

Budget; Budgeting

## Definitions

Budget Forecasts: A projection of a particular financial value such as tax revenues.

Multiyear Budgeting: An approach to budgeting that plans for more than 1 year.

Rainy Day Fund: A fiscal tool that states can use to accumulate reserves and then drain them to mitigate budgetary pressures.

## Introduction

Over time, states have adopted a range of budget practices (e.g., Rubin 2005; Wagner and Sobel 2006). There is growing evidence, for example, that states have adopted different and even hybrid budget models over the past few decades (e.g., Botner 1985; Reddick 2007). More so, while state forecasting practices can be categorized into three general approaches, some still have distinct practices (Mikesell and Ross 2014). States have also taken different approaches to budget stabilization over the business cycle, as well.

Despite this variation in state budget practices, researchers recommend that states adopt evidence-based approaches and even apply data analytics to budgeting (e.g., National Association of State Budget Officers [NASBO] 2019; The Pew Charitable Trusts 2014, 2018). Further, researchers have considered the implications of adopting a multiyear approach to budgeting (e.g., Hou 2006). Whether these approaches will make states financially sustainable given concerning projections from the United States

S

Government Accountability Office (2019) remains to be seen.

## Budget Formats

State budgets can use different types of budget models, also referred to as formats or approaches (e.g., Grizzle 1986; Reddick 2007). As a brief review, major types of budget models are defined below. Budget models have developed over time (e.g., Rubin 1993; Tyer and Willand 1997). Schick (1966), for example, argues that budget reforms follow three steps: control, management, and planning.

Incremental budgeting is defined as follows: "this year's budget is based on last year's budget, with special attention given to a narrow range of increases or decreases" (Davis et al. 1966, pp. 529–530). Rational budgeting models, such as program budgeting and zero-based budgeting, have evolved over time (e.g., Lauth 2014; Tyer and Willand 1997). A recent definition of program budgeting is as follows: "programs are the main unit of analysis, rather than departments or divisions" during the budget process (Kavanagh 2011, p. 28). Further, zero-based budgeting includes activity cost centers and decision packages so "that each program is required to justify its existence during each budget cycle, and every item included in a proposed budget needs to be justified" (Lauth 2014, p. 3).

Early survey research from Botner (1985) showed that states used different budget models, ranging from program budgeting to zero-based budgeting. Interestingly, Botner (1985) also provides evidence about hybrid budget systems. Under a hybrid budget system, multiple budget models (or formats) are utilized, potentially to reflect the unique budget context of each respective state (Also see Grizzle 1986).

A more recent study from Reddick (2003) provides further evidence of a hybrid budget model in states. Reddick (2003) groups different budget models by their level of rationality. The rational approach to budgeting, including zero-based and program budgeting, is followed by incremental budgeting (e.g., Davis et al. 1966) and then garbage can budgeting (Cohen et al. 1972). Empirical analysis provides evidence of "hybrid forms of budgeting" (p. 337). For example, total expenditures and educational expenditures are explained in part by incrementalism.

Reddick (2007) examines state survey data from 1989 to 1999 and finds that on average states use program budgeting the most, followed by incremental budgeting, biennial budgeting, performance budgeting, and zero-based budgeting. Empirical analysis shows that both rational and incremental models are associated with expenditures, reinforcing the notion of hybrid budgeting. Reddick (2007, p. 237) makes an interesting observation: "Incremental budgeting may not be the most popular approach in the recent academic debate, but state budget officers still seem to use it extensively."

## Forecasting

State revenue forecasts are an essential aspect of the budget process. Generally, revenues should be forecasted by source. For example, states may forecast particular revenues, such as sales tax and income tax.

Research has considered the role of political actors in the forecasting process and how they are related to forecast accuracy (e.g., Bretschneider and Gorr 1987; Bretschneider et al. 1989). Some have posited that revenues may be strategically underforecast, or conservatively estimated, to avoid the political and professional ramifications of projecting more revenues than are actually received (e.g., Tyer 1993). Underforecasting as a form of forecast bias can also be used to accumulate surplus funds during an economic upturn in preparation for a future economic downturn (e.g., Vasche and Williams 1987).

One early study of 23 states from 1978 to 1987 found that states conservatively estimated revenues 0.5% of the time (Cassidy et al. 1989) while another study finds evidence of underforecasting in three states (Feenberg et al. 1989). A more recent study from Rodgers and Joyce (1996) finds evidence of average

underforecasting by 2.1% and a standard deviation of 3.3% from 1975 to 1992. They also find that forecasts vary across upturns and downturns in the business cycle. Others have found no evidence of state revenue underestimation (e.g., Mocan and Azad 1995).

Researchers have examined the information set that forecasters use at the state level, to understand other factors that may be related to forecasts (e.g., Feenberg et al. 1989). Put another way, the information set considers the different internal and external factors that may be considered by state revenue forecasters (Jones et al. 1997). Economic, political (e.g., Gentry 1989), and institutional factors (e.g., Krause et al. 2006) are commonly considered.

Forecasting process is also important. Mikesell and Ross (2014) note that there are three general processes that most states follow. First, some states have employees in a legislative research group create forecasts while others in the executive branch also forecast. Second, other states only have forecasting from an executive agency (Also see Rubin et al. 1999). Third, states may pursue a consensus approach, to develop "a single forecast that emerges from cooperative work between legislative and executive branches" (Mikesell and Ross 2014, p. 192).

## Rainy Day Funds

States face a variety of exogenous shocks that may reduce revenues and constrain their ability to provide public services. Consider the impact of a recession. As unemployment rises and business activity falls, state tax revenues will decline, and they will have to address a potential budget shortfall. Expenditures could be cut, which might not be politically tenable, so an alternative is to use reserves accumulated in a rainy day fund (e.g., Joyce 2001).

A rainy day fund, in theory, is considered to be a countercyclical fiscal instrument (e.g., Hou 2003). In economic upturns, or when the economy is performing at or exceeding expectations, states may save revenues in the rainy day fund. Then, in the event of a shock such as a recession, the rainy day fund can be drained, to mitigate the impact on public service provision.

There are a few caveats to rainy day funds. Institutional rules regarding withdrawal and deposit may govern how states use these funds (e.g., Hou 2004). Further, Wagner and Sobel (2006) provide evidence that rainy day funds can act as a workaround to tax and expenditure limitations.

An extensive literature has evaluated state rainy day funds. It has evaluated questions such as what are the determinants of rainy day funds and if they operate as countercyclical fiscal instruments. Many of the findings in the literature vary due to different years being analyzed, alongside methodological debates (Maher et al. 2017).

One side of the literature examines the determinants of rainy day funds and their optimal size. Hou (2004), for example, finds that institutional rules and political factors are related to budget stabilization funds (Also see Rose 2008). Joyce (2001) challenges the recommendation that rainy day funds should be 5% of the general fund and argues for states to consider their unique context when accumulating reserves. More recent research applied Markov models (Wagner and Elder 2007) and filters (Zhao 2016) to estimate specific amounts of rainy day fund for each respective state in the context of the business cycle.

Another side of the literature evaluates the impact of rainy day funds starting with the early 1990s recession. Sobel and Holcombe, for example, find that states with institutional rules requiring them to deposit funds in rainy day funds have 17% less fiscal stress in their budget. Building on Sobel and Holcombe (1996), a later study from Douglas and Gaddie (2002) finds that other funds retained in the general fund balance can help to mitigate fiscal stress. Wagner and Elder (2005) also find that institutional rules influence the use of rainy day funds.

Research covering multiple business cycles, such as Hou (2003), finds that a 1% increase in budget stabilization funds as a percentage of general fund expenditures is associated with a quarter percentage point decrease in the expenditure gap from 1979 to 1999. Later research from Hou and

Moynihan (2008) including data for the 2001 recession shows that states drained their unreserved undesignated fund balance before their formal rainy day funds (Hou and Moynihan 2008). More recent research is summarized in Hou (2013).

Research including data from the Great Recession finds that a 1% increase in a lagged budget stabilization fund measure is associated with a 0.51% decrease in the expenditure gap (Wei and Denison 2019). Similarly, Boylan and Ho (2017, p. 356) "find that states with higher average rainy day funds experience smaller cuts in Medicaid spending". Rueben et al. (2018) also argue that rainy day funds helped delay the effects of the Great Recession on state budgets.

## Multiyear Budgeting and Fiscal Sustainability

As states address a variety of exogenous events, such as recessions or pandemics, their revenues will likely be constrained and their ability to provide public services may also be reduced. States must also address issues with public pensions, which have unfunded liabilities numbering in the trillions and face continued debates over potential policy solutions (e.g., Diebold et al. 2018; Novy-Marx and Rauh 2009). Collectively, such concerns are perhaps best reflected in United States Government Accountability Office (2019) projections of continuing state and local government negative operating balances for decades into the future.

Researchers and practitioners have argued for the use of multiyear budgeting to emphasize fiscal sustainability (e.g., Kavanagh 2007). This approach would potentially obviate short-term fiscal decisions that negatively impact state fiscal health in the long term. Hou (2006) and Zhao and Coyne (2014) provide rich theoretical consideration and are discussed below.

Hou (2006), for example, provides a detailed argument for needing to go beyond an annual perspective in state budgeting and finance. Even if managers can balance revenues and expenditures each year, "mere success at achieving annual structural balance is far from enough to eliminate cyclical deficits" (Hou 2006, p. 733). Instead, structural balance that goes beyond the annual perspective, and is held over economic upturns and downturns, is recommended. Zhao and Coyne (2014) also develop a theoretical model which considers state fiscal sustainability over the business cycle and apply econometric methods to test their model.

## Conclusion

Underlying the considerable variation in state budget practices are the rapid changes to budgeting and financial management. For example, Lee (1997) provides survey evidence that states considered more program information into their budget process from 1970 to 1995. National surveys even reflect that state bureaucrats have changed their preferences for budget minimizing from the 1970s to 2000s, as well (Arapis and Bowling 2019).

Amidst these changes, there are continued calls for state budget and financial management research and reforms. Evidence-based recommendations may help strengthen state budget development (e.g., NASBO 2019; The Pew Charitable Trusts 2014). Further, a focus on multiyear planning and budgeting, with long-term forecasts and greater attention to structural balance, is garnering increased attention from researchers and practitioners (e.g., Kavanagh 2007; Zhao and Coyne 2014).

# State Capacities for Public Policies in the Uruguayan Subnational Governments

José Raúl Rodríguez
University of the Republic, Montevideo, Uruguay

## Introduction

This entry presents a description of the types of subnational state capacities in Uruguay, applied to the second level of government, the *intendencias*. The document proposes a typology based on a combination of two dimensions: (i) political capacities and (ii) administrative capacities, resulting in different types of departmental state capacities.

In Uruguay, there are 19 departmental governments (*intendencias*) that constitute the second level of government. Under this level, there are 125 municipalities (third level), which are completely subordinate to the departmental governments from a fiscal and administrative perspective, despite having political autonomy. Although Uruguay is a unitary and centralized state, the departmental governments have assumed increasing functions and resources from the 1990s onward. In this regard, they have become privileged state organizations for the design and implementation of public policies aimed at regional and territorial development (Oszlak and Serafinoff 2011).

These departmental administrations have a system of government that can be classified as "hyper-presidential," meaning that the executive branch (*intendente*) imposes itself on the legislative branch (*Junta Departamental*). This institutional configuration makes the *intendente* and his or her administration (*intendencia*) the main actors in the administration of the departmental government (Koolhaas and Rodríguez 2006).

The document is divided into two parts. Firstly, a brief conceptualization and operational definition of the concept of departmental state capacities applied to Uruguay is given. Secondly, the typology is introduced, based on the crossing of political and administrative dimensions. Finally, types assumed by departmental state capacities in Uruguay are described: (i) patrimonialism; (ii) bureaucratic; and (iii) new governance; plus, the hybrid types that complete the classification.

## Definition of Departmental State Capacities

Departmental state capacities are the ability of the departmental governments (*intendencias*) to define policy guidelines and implement them. Thus, the concept of "state capacities" is defined concerning the concepts of autonomy and effectiveness (or efficacy) with the government and administration (Mazzuca 2012).

The problem of autonomy is relevant to the study of multilevel intergovernmental relations, where subnational governments are usually subordinated to central governments in the context of the distribution of government work (functional decentralization). At the same time, since they are agents seeking the socioeconomic development of their territory, they are in constant interaction with the market and local society agents, who seek to obtain advantageous conditions for the achievement of their objectives. Therefore, the problem of autonomy becomes a differential attribute of the capacity of the *intendencias* to set their policy objectives, both concerning the central government and private and social actors (businesses, civil society, the third sector, and private actors).

Efficacy, on the other hand, refers to the capacity of the departmental government to make its decisions effective and the extent to which these decisions contribute to the achievement of policy objectives. Thus defined, effectiveness is closely related to the performance of the government. In the case of the *intendencias*, this issue is directly linked to how their human, technological, and material resources are organized to carry out government administration within the scope of their competencies.

## Political and Administrative Capacities of the Municipalities

After defining departmental state capacities as the ability of the *intendencias* to define policy orientations and implement them, it is necessary to identify the conditions and attributes of the government to define policy orientations (autonomy) and implement them (effectiveness). Thus, an operational definition of the departmental state capacities of Uruguay can be defined as the set of political, administrative, and technical attributes oriented to the design and implementation of public policies that have been defined by the departmental government within the scope of its constitutional competencies and powers. This definition includes two dimensions: (i) political capacity and (ii) administrative capacity (Alonso 2007; Cabrero 2004; Huerta 2008; Mizrahi 2004). From both dimensions, different subdimensions and indicators emerge that complete the operationalization process (see Fig. 1).

### Political Capacities of the Departmental Government

Political capacities are how power is exercised by the departmental government in public policy processes. Some subdimensions can be inferred here, such as the type of leadership of the intendentes, the channels of communication and interaction

**State Capacities for Public Policies in the Uruguayan Subnational Governments, Fig. 1** Conceptualization of "departmental state capacities" in Uruguay

with the market and civil society, and the type of institutional linkage with the central government.

These subdimensions lead to a set of indicators related to the observable attributes of the government organization and its leadership, mainly the *intendente*, its ties with public and private agents, the models of government leadership, and administration and decision-making systems, which together constitute different categories or types of political capacities. Three categories are defined for this first dimension: (a) particularism; (b) hierarchical; and (c) managerial.

Particularism capacities refer to *intendentes* who use discretion as their main influence strategy, have no restrictions to favor particular interests, and are not accountable. They negotiate personally with the central government and are based on informal arrangements. In short, the departmental government depends clearly on the personal capacity of the *intendente* to connect with actors outside the government.

The hierarchical political capacities rest mostly on systems of formal rules. The *intendentes* delegate their powers to reliable officials and the administration but always in compliance with the law. Decision-making is bureaucratic and hierarchical, and no alternative channels are allowed. There is no promotion of the participation of actors outside the government in decision-making. In political terms, it is a form of administration based on the unity and centralization of command, typically bureaucratic.

Finally, management capacities are characterized by results-oriented leadership that favors articulation, coordination, and collaboration with public and private actors. The decision-making model is less hierarchical and more horizontal. There are nondiscretionary administration contracts that offer greater transparency and accountability.

## Administrative Capacities of the Departmental Government

Administrative capacities are defined as how the departmental government organizes and orients its human and material resources to implement public policies. Some of its subdimensions are the functional organization of the government (organizational chart of the departmental government); the mode of administration, organization, recruitment, and promotion of human resources (administrative career and performance systems); and the budget and financial structure.

Three categories are defined in this second dimension: (a) informal, (b) formal, and (c) innovative.

The former is characterized by an informal and discretionary form of organization, derived from the absence of norms or the systematic failure to comply with them. The administration of human resources is equally informal, increasing the discretionary power of the *intendentes* to establish particular conditions. There is no administrative career or performance system. Budgetary systems have low internal and external controls, which increases the *intendentes*' discretional power over the origin and destination of expenditures. Formal administrative capacities, on the other hand, are characterized by the development of a complex system of rules that precisely regulates all interactions between the organizational, human, and material resources of the departmental government. Organizational roles and functions such as human resources and budgetary systems are clearly established by specialized systems of rules, which are complied with.

Finally, innovative administrative capacities involve greater flexibility in the formal regulatory system and the promotion of collaborative and associative arrangements. There are incentives for the coordination and combination of functional units, including with organizations outside the departmental government. Horizontal and decentralized decision-making systems are promoted. Human resource systems are flexible, allowing for greater mobility at the horizontal level. Public–private participation in the provision of public services is contemplated, and there is a greater capacity to contract with external resources. Finally, budget systems are results oriented and can include external financing mechanisms (public and private), which require greater transparency, monitoring, and evaluation of spending.

## Typology of Departmental State Capacities in Uruguay

From the intersection between these two dimensions, three types of departmental state capacities are identified: (I) patrimonialism; (II) bureaucratic; and (III) new governance (see Table 1).

The patrimonialism combines particularist political capacities with informal administrative capacities. The patrimonialism is a personalist, discretional, and informal modality. They are related to the presence of strong leadership, where the *intendente* monopolizes the links with the market, civil society, and the central government. The *intendente* is a political leader and the capacity of the departmental government depends on the *intendente's* personal capacity.

From the standpoint of administrative capacities, patrimonialism is characterized by high informality, noncompliance with regulations, and the absence of formal administrative procedures. The bureaucratic capacities are associated with departmental governments with high rationality and formalization of their political and administrative structures. They are organizations that are subordinate to the representative government and whose leadership responds to political orientations within the scope of a clear separation between political and administrative functions (Weber 1922). The democratic political leadership sets the strategic guidelines of the government, which descend to the administration through a precise system of rules and formal procedures. As for the relationship with the private sector, the bureaucratic modality does not promote it, but rather restricts it, considering private and particular actors as a risk (isolated state). As for relations with the central government, they are based on a broad regulatory capacity that precisely establishes the functions and margins for collaboration among government levels, as well as the sources of resources and financing for their implementation.

Regarding administrative capacities, the main characteristic of the bureaucratic type is the existence of an effective merit-based career system. Some of its main components are: (i) staff members are appointed based on competitive examinations; (ii) there are restrictions on the arbitrary mobility of staff members; (iii) the political neutrality of administrative staff is guaranteed; (iv) there is a civil service commission or office responsible for monitoring the career system; (v) there is a centrally established grade structure; (vi) salaries are set according to grades and not by performance; and (vii) entry to the civil service is promoted only by the lowest grades throughout the career and as a result of seniority and merit (Narbondo and Ramos 2001).

Lastly, the third type of departmental state capacities is new governance. This form combines managerial political capacities with innovative administrative capacities. It presents high levels of autonomy and effectiveness, within a context of broad political and social contestability, with high levels of transparency and accountability (Huete García 2010; Melo 2010). It combines innovative administrative capabilities (more flexible and

**State Capacities for Public Policies in the Uruguayan Subnational Governments, Table 1** Types of departmental state capacities

| | | **Administrative capacities** | | |
|---|---|---|---|---|
| | | **Informal** | **Formal** | **Innovative** |
| **Political capacities** | **Managerial** | External neo-clientelism | Hybrid 3 (In transit from II to III) – (Neo-weberian) | **III. New governance** (Networks – new public management) |
| | **Hierarchical** | Hybrid 1 (in transit from I to II) | **II. Bureaucratic** | Hybrid 4 (In transit from II to III) – (new public management) |
| | **Particularism** | **I. Patrimonialism** | Hybrid 2 (in transit from I to II) | Internal neo-clientelism |

adaptive) and political capabilities geared toward public–private participation and the generation of networks (Cunill Grau 2014).

Concerning political capacities, these are departmental governments that promote collaboration through the implementation of networks and horizontal (nonhierarchical) decision-making through public–private management arrangements. The generation of coordination spaces and comanagement areas with participation and social control is encouraged. The provision of goods and services by civil society is contemplated. Finally, for the relationship with the central government, coordination and multilevel articulation are promoted (councils, roundtables, and intersectoral programs).

In terms of administrative capacities, greater innovation is being developed as there is flexibility in the administrative arrangements typical of the bureaucratic model. At the level of internal organization, there is greater flexibility in the organizational structure and in the functions carried out by the *intendencia*. There are internal coordination areas (cabinets and cross-cutting departments) that design, implement, and evaluate policies and services jointly.

As for personnel systems, typical instruments of new public management are incorporated, such as performance evaluations and remuneration for productivity and management commitments for results at the management level. Finally, in the area of budgetary and financial management, results-oriented budgeting is introduced, monitoring and evaluation systems are developed, and systems of social and horizontal controllers for budget design and execution are promoted.

Finally, there are hybrid modalities that combine different types of administrative and political capacities. For example, there are two intermediate hybrids between patrimonialism and the purely bureaucratic type: in one case through the development of political capacities of a hierarchical type, and in the other through the development of administrative capacities of a formal type. Both types of capacities express an intermediate step between patrimonialism and the bureaucratic modality of departmental state capacities. The same occurs with the hybrids that arise from the combination of administrative and political capacities intermediate between the bureaucratic and new governance types.

At the extremes, there are antagonistic types that express two risky configurations in terms of state capacities. First (external neo-clientelism), the combination of informal administrative capacities with managerial political capacities results in a risk of co-optation of the state structure by the private sector. At the opposite extreme (internal neo-clientelism), there is a combination of innovative administrative capacities and particularism political capacities. This type entails the risk that administrative instruments in theory, oriented by results, are applied in practice for particularism purposes. In this modality, the *intendente* makes a distorted use of administrative instruments, rewarding or punishing the loyalty of officials to their leadership (through hiring, firing, performance evaluation, management commitments, etc.). Hence the name "internal neo-clientelism," as it operates at the level of the human resources structure of the organization itself.

## Conclusion

This entry aims to contribute to the identification and description of departmental state capacities in Uruguay. Departmental state capacities have been defined as the set of political, administrative, and technical attributes placed at the service of the design and implementation of public policies defined by the departmental government within the framework of its constitutional competencies and powers. This conceptualization is made up of two dimensions of analysis that are political and administrative capacities, which give rise to different types of departmental state capacities: (I) patrimonialism; (II) bureaucratic; and (III) new governance, which is complemented by other hybrid forms.

The value of this typology lies in the possibility it offers to study the complexity and heterogeneity of the departmental governments in Uruguay as an opportunity to think of strategies to strengthen their capacities for the design and implementation of public policies.

This work can also contribute to the study of sub-national state capacities in other countries of the region and the world that, like Uruguay, have a unitary and centralized institutional and territorial design.

In this context, the development of subnational state capacities is a challenge for the design of public policies for local and regional development, which contribute to a global sustainable development agenda.

# State Income Taxes and Their Impact on Migration

Whitney B. Afonso
University of North Carolina at Chapel Hill, Chapel Hill, NC, USA

## Synonyms

Impact of subnational income tax on in and out migration; State income taxes; Tax policy's impact on the locational choices of citizens

## Definition

Migration consists of movements of people's residences, in and out of a jurisdiction. In this case a state.

## Introduction

Income taxes are a major source of revenue for most state governments in the United States; however, it is still hotly debated by scholars, politicians, and citizens. Many states have discussed overhauling their income tax policies, or even eliminating them, since the Great Recession. For example, in 2013 Nebraska, Kansas, North Carolina, Louisiana, and Oklahoma discussed the potential of eliminating their state income tax. While, none of these states did – many made substantial changes to their income tax policy. North Carolina switched from a progressive income tax to a flat tax, lowered the rate for all income groups, and more than doubled the standard deduction. In contrast, some states are increasing their income tax rates, in some cases specifically targeting high income earners. For example, Minnesota added an additional tax bracket for high income earners and Alaska discussed adopting an income tax. As states will undoubtedly continue to revise their income tax policies it is critical to understand how that income tax effects the economy of the state. An

important aspect of the income tax and its relationship to the state is the effect that it will have on migration – both people moving in to the state and those that may leave the state.

The issue of the impact of income tax policy on migration is an especially difficult one to study. This is for many reasons such as: the changes that states make to their income tax policy are often small in magnitude which make their effects harder to identify, it is difficult to remove other confounding factors that may be in place that may or may not be independent of the change in income tax policy, and presumably the increase in income tax (or decrease) is met with a corresponding increase in expenditures which citizens should also value. This mixed effect is often referred to as the same sign problem. Despite these limitations there are studies that have identified effects of income tax policy on migration.

While the results are mixed as to the effect of income tax on migration, there are some themes that emerge. First, high income earners are more sensitive to changes in income tax and more able to respond to them. This means that the migration of high income earners is the most likely. Second, the immigration (moving into a state) is more likely to be effected than emigration (moving out of the state). Third, a lot of factors besides income taxes affect households' decision to move and where to move.

This chapter will cover expectations about the effects of income taxes on migration; it will discuss the relevant research relating to the effect of income tax and migration, and the other factors that play a role in household's location decision. It will conclude with takeaways and important considerations for policymakers and citizens alike.

## Expectations from the Theory

Neoclassical economic theory suggests that progressive, subnational income taxes will not be effective because they will cause high income residents to exit the state and low income people to migrate into the state (Oates 1968; Musgrave 1969). This will lead to a void of high income earners in the state which could even lead to greater inequity in the state, since high income earners will have to be compensated with even higher incomes to attract them to positions in a high income tax state. This is one reason that many argue that redistribution policies are more effective at a national level than a subnational one.

## Evidence from the Literature

The evidence on the relationship between subnational income taxes and migration is mixed. There is quite a bit of evidence from the United States and Europe that suggests that residents, especially high income residents, are more likely to move to avoid higher income taxes (Feldstein and Wrobel 1998; Feld and Kirchgässner 2001; Bakija and Slemrod 2004; Coomes and Hoyt 2008; Afonso 2015; Afonso 2016). While this is a difficult area to study because of all the confounding effects like weather, costs, and preferences – many of these are dealt with in the design of the model or the population being studied. For example, Afonso (2015) studies military personnel, a highly mobile population, and finds that they do immigrate to low income tax states and that the size of the effect grows with wages. Similarly, Feld and Kirchgässner (2001) study Swiss cantons, control for factors such as amenities and infrastructure, and find that tax burdens have an effect of migration decisions especially for the wealthy. A third study, examined the adoption of the Connecticut state income tax in 1991, taking advantage of a large policy shock, to study the effects on migration (Afonso 2016). The results suggest that the presence of an income tax did decrease immigration, but had no effect on emigration (or exit from the state).

On the other end of the spectrum, numerous studies have found little evidence to support the theory that income taxes will affect migration decisions (Day and Winer 2006; Liebig et al. 2006; Young and Varner 2011; Varner and Young 2012). Young and Varner (2011) study the strictly progressive millionaires taxes that have been implemented in New Jersey and find that these taxes do not cause wealthy residents to emigrate. Their study takes advantage of being

able to use earners within the top 5percent of earners in New Jersey as a control group for earners within the top 1 percent, who are subject to the new tax. They find no evidence for a relationship between emigration and income taxes for this population, which is the most migration elastic. This study, like the Afonso (2016) study, takes advantage of a region with fewer barriers to migration as evidenced by the great number of people who commute in and out of different states in the region. It is also worth noting that there is evidence on a closely related issue, the relationship between income taxes and economic development. In this area the literature suggests that state income taxes do not retard growth (Leigh 2008; Chernick 2010).

## Other Factors That Influence Migration Decisions

When considering and/or deciding to move there are many factors that may be considered. They include job opportunities, taxes, amenities, weather, and the literal and figurative costs to moving – including the cost of moving your things, selling your home and the psychological costs of moving. Due to the complex nature of these decisions, most scholars agree that migration is inelastic, meaning people prefer not to move, they are not particularly sensitive to changes in costs. The primary reasons that scholars have identified for this preference are: 1) it is costly to move, 2) it is costly and bothersome to find new employment, 3) given that you are not finding new employment, it is preferable to have shorter commute times, and 4) people are attached to their communities and value the relationships they have within their community (for more information on this please see Afonso 2016).

## Conclusion

There are many factors that need to be considered when assessing the relationship between state income taxes and migration decisions. Income taxes are far from the only factor that is considered when deciding where to (re)locate. Beyond that, if you are working in one state and avoiding those high income taxes by living in another state, you may just be increasing your commute time. That is because taxes are due to the state where the income is earned. Some states have reciprocity agreements. Reciprocity agreements are when incomes are taxed in the state of residence, even if that is not where the income is earned. These agreements are viewed as a way to decrease tax competition between states. New Jersey and Pennsylvania have a reciprocity agreement, so using this example. If you work in New Jersey and live in Pennsylvania you will be taxed by Pennsylvania. However, if you work in New Jersey and live in New York, you will still owe income taxes to New Jersey. So how do states without reciprocity agreements avoid multistate taxation (which would be in the preceding example being taxed by New York and New Jersey)? Largely through tax credits. Tax credits are given by the state in which you reside to credit you for any income taxes already paid to other states. These credits may or may not cover the entire tax burden owed to your resident state depending on the tax rates in question.

While states may consider changes to their income tax policies for many reasons including ideological ones, it is important to think through the potential unintentional consequences of those choices. Unfortunately, the literature has mixed findings with regard to the effect of income tax policy on migration. However, there is evidence (while not universal) that high income earners are more sensitive to high income taxes and that the presence of high taxes will deter residents from living in a particular state. This finding is very intuitive. High income earners will have a larger tax burden so the cost of living in a high income tax, especially progressive, state is greater. They, on average, have greater expendable income making the cost of moving more manageable. Thus, it should not be surprising that the findings suggest that this population is the most affected. Additionally, it is also not surprising that immigration is more affected than emigration. This is because often, when studying immigration, you are

studying a population that has already decided to move and the question is "where to"? Taxes may likely play a role in that decision. However, emigration and tax policy presumes you were not otherwise moving and have decided to because of taxes. That is a much more costly (both literal and psychic) move. Therefore states considering lowering or increasing their income taxes should examine what their peer and neighboring states are doing as well as carefully monitor the immigration of new residents into the state.

# State Strategic Planning System, Russia

Igor Khodachek
Nord University Business School, Bodø, Norway

## Synonyms

Long-range planning; Strategic governance system; Strategic management system

## Definition

The state strategic planning system in Russia is an integrated legal framework that regulates the design and the approval of long-range state planning documents.

## Introduction

The Soviet long-range planning system is known for great achievements like industrialization and mass engineering education, which enabled accomplishment of the nuclear and space programs just in 20 years since the end of the devastating Second World War. Thus, it would be natural to expect Russia to turn back to the Soviet model for new great achievements in designing its state strategic planning system. The Soviet governance was built on two pillars: the theory of the socialistic state, based primarily on Marxism with significant amendments, and the developed methodology of administrative planning (well-known

pyatiletki – five-year plans). This entry does not present any strong evidence to claim that Marx and socialism have returned. What is it then, if not communism, that Russia builds on while defining its national strategy and designing the state governance system? The entry tries to answer this question by connecting the revision of Soviet administrative planning and the commentary on the emerging Russia's state strategic planning system. The strategizing pattern that the Russian state is trying to pursue is complex and sophisticated – the emerging system of strategic planning indeed re-evaluates the Soviet planning methodological legacy, but, simultaneously, it accommodates Western ideas of the liberal market as well as rational planning (Ansoff 1965) in the design of state strategic planning.

This entry can be relevant for those who are interested in governance ideas outside the mainstream literature and also for those, who, in their research on national strategy, are trying to connect ideology and governance.

## Soviet Planning and How Russia Is Not Coming Back to It

In 2015, the Russian Federation celebrated 25 years of independence – the Declaration of State Sovereignty of the Russian Soviet Federative Socialist Republic was signed on June 12, 1990. Russia is generally recognized as the successor state of both the USSR and the Russian Empire. Unlike the case in China, the introduction of market mechanisms into the socialistic planned economy of post-Soviet Russia was rapid and dramatic. The reforms denied the possibility of a smooth transition, and the main planning institutions had been destroyed deliberately by the reformers as they constrained liberal market mechanisms. However, the market mechanisms alone could not instantly provide basic welfare. Only by the end of 2007, after a severe economic crisis when the economy contracted by up to 50%, did Russia reach the GDP (PPP) level it had in 1991 (RA Expert 2007). Although the liberal market paradigm of economic policy, proclaimed at the beginning of the 1990s, dominates both official and national academic discourse, there have been several attempts to re-evaluate the Soviet planning legacy. Soviet socialistic planning functioned for more than half a century and appeared to be extremely effective in concentrating resources on key directions like space and nuclear programs. Besides, it allowed the rapid recovery of the country to be achieved after the exhaustive Second World War, without external aid like that of the Marshall Plan. Even after the collapse of the Soviet Union, its merits still attract thinkers searching for alternatives to Western mainstream ideas (see, e.g., Cottrell and Cockshott 1993).

There were two pillars of the planning system in the Soviet Union: the theory of the socialistic state, based primarily on Marxism with significant amendments, and the methodology of planning. The key feature of this system was a heavy reliance on national science that provided both the theoretical background of Soviet socialism and technologies for planning.

Marx's theory was enriched by significant amendments, suggested by leading Soviet economists and Joseph Stalin himself: the so-called theory of the development of the socialistic state. The fundamentals of this theory had crystallized within the 15 years between 1936 and 1951 in the discussion on a new course of political economy for the Soviet education system. There were two main products of that discussion: the draft of a textbook "Political Economy of Socialism and a Famous Collection of Essays" by Joseph Stalin, named Economic Problems of Socialism in the USSR (Stalin 1952). While not denying the role of the market in the economy, Stalin suggested that the regulatory system in socialism should be twofold: the market and the state.

In the 1960s, the theory of the socialistic state was enhanced by the theory of optimal functioning of the economy, suggested by several Soviet economists at the Soviet Academy of Science: Albert Vainshtein, Aleksandr Lurye, Leonid Kantorovich (1975 Nobel Prize laureate), Vasily Nemchinov and Viktor Novozhilov. The main contribution of the theory of optimal functioning of the economy to the planning system was the econometric modeling of mass consumer behavior and linear programming. The theory

proclaimed the existence of an optimal point in mass production where the differential labor inputs are in proportion with the differential social effect. In their work, Aleksandr Lurye and his colleagues reflected on the ideas of the Russian imperial economist, Mikhail Tugan-Baranovsky, the scientific leader of Nikolai Kondratiev, known for his theory of "K-waves" (Kondratiev waves) or long economic cycles. The theory (or in later works – the system) of optimal functioning of the economy suggested the following principles:

- Combination of centralized planning with the autonomy of single production entities
- Coordination of the interests of production entities with general economic policy
- Wide-range use of economic instruments (prices, profits, interests, etc.) in the design and implementation of economic plans
- Application of mathematical methods, linear programming, and numerical engineering

In the 1980s, the theoretical framework of Soviet planning focused on the duality of the person in a socialistic economy, trying to balance his/her roles as a unit of production force and as a consumer. The issues of quality of life, social interaction, and spiritual development led to the concept of socioeconomic optimum, where these synthetic needs, sometimes of a nonmaterial nature, could be satisfied. Thus, the Soviet theory of the socialistic state shifted its focus to human needs and the ways in which the state could satisfy them.

The second pillar was the planning methodology based on numerical engineering and the balance method with its advanced version – the interindustry balance. The interindustry balance method is also known as the input-output method, further developed by Wassily Leontief (1973 Nobel Prize laureate). The idea of interindustry balance was applied in the first balance of the national economy in 1923. Although Leontief is the most well-known author of the input-output method, his Soviet counterparts, Mikhail Bor, Stanislav Strumilin, and Shamai Turetskiy, did much for the fully-fledged application and development of the interindustry balance method in the planning system of USSR in the 1950s. Gosplan (the state planning commission created in 1921) widely adopted the interindustry balance method in forecasting, industrial and spatial development, and strategic planning.

The system of complex planning and forecasting would be impossible without the application of mathematical apparatus, developed by Leonid Kantorovich and his colleagues, who, in fact, founded the Soviet school of mathematical modeling in economics. The models included three levels: industry (sector), multiindustrial complexes, and national economy. Through the integration of these models with spatial development plans, Gosplan tried to achieve the balanced and efficient use of the vast territory of the Soviet Union. The strategic planning system used the scenario approach and included several dimensions, such as:

- Quality of life
- Scientific and technical development
- Economic, industrial (sectoral), and spatial modeling

It used the most advanced, for that time, integrated computing and modeling infrastructure, named the Automated System of Planning Calculations. In the 1970s, the advances in calculation techniques allowed the use of the program-target approach to long-term strategic planning. Target programs set priorities and problems that required a special focus, apart from the five-year plans. The complex hierarchy of plans' and programs' targets challenged the calculating infrastructure, but, at the same time, it allowed their aims to be attached closer to the ground, making the planning system more flexible and realistic.

Smirnova (2013) mentions the following key achievements of the Soviet planning methodology:

- Continuity and steadiness of strategic planning
- Integration of strategic planning with scientific and technological progress
- Integration of spatial and industrial (sectoral) dimensions of economics in strategic plans

Vivid examples of effective application of those principles are the spatial-industrial complexes, created in Siberia under the supervision and assistance of the Siberian branch of the Soviet Academy of Science.

The reforms, conducted at the beginning of the 1990s with the aim of replacing centralized administrative planning with market coordination mechanisms, destroyed the main Soviet planning institutions such as Gosplan, applied economic research infrastructure, and computing machinery. However, the expectations of increasing efficiency in the economy and overcoming the pitfalls of administrative planning were not fulfilled due to the uncontrolled collapse of supply chains and social welfare. The inefficiency of the Soviet administrative system compensated at the higher level by its smart design, aimed at allocating industrial production according to the geographical conditions of the vast country. When national republics gained independence, there were no stimuli for new owners of industrial assets to cooperate through custom and administrative borders. So, all post-Soviet countries have lost significant shares of their GDP, creating catastrophic consequences for welfare.

As an element of Soviet heritage, today the Russian state has a huge and developed bureaucratic apparatus and an advanced, but obsolete, welfare system. Besides, the state is a significant actor in the national economy, directly or indirectly controlling in total around 70% of Russia's GDP (Federal Antimonopoly Service report 2016). The governance of the state, the public sector and the state-owned enterprise sector, is extremely sophisticated and faces continuous attempts to reform it by top political leaders.

In June 2014, President Putin signed a new law #172-FZ from June 28, 2014 "On strategic planning in the Russian Federation." This law binds together in a single huge governance system all three levels of public governance (federal, regional, and municipal): public sector entities, state-owned enterprises, and, although indirectly, private companies that have so-called "strategic significance for national security and economic development." The law defines key concepts of strategic planning, e.g., aim, task, result (outcome), forecasting, programming, monitoring, the system of strategic planning, etc. It also states key principles of strategic planning, describes the documents that are to be issued at all levels of governance for the implementation of the law, and regulates interrelations among the participants of strategic planning. The so-called system of strategic planning emerges as an extremely sophisticated set of forecasts, strategies, and plans, aimed at coordinating federal, regional, and local budgets with the socioeconomic development of Russia, its regions, and municipalities. The federal Ministry of Economic Development became responsible for creating the state strategic planning system.

In 2015, the Ministry of Economic Development initiated a comprehensive research project aimed at formulating suggestions on the implementation of the new law on strategic planning. The work was outsourced to the Institute of State and Municipal Management at the National Research University Higher School of Economics. Under the authorship of the head of the institute, Andrey Klimenko and his group, the 284-page report provides an overview of the theory and methodology of strategic planning on an international scale and suggestions on amendments to the federal legislation. Besides, the report analyses the law itself and concludes that the design of the system of strategic planning in Russia implies the rational planning model, developed by Igor Ansoff (1965) and reminiscent of the Soviet planning system. According to Klimenko et al. (2015), the key features of the design of the system are rigid hierarchy, direct through top-down planning and bureaucratic control. All these, as the report says, allow the emerging system of strategic planning to be defined as belonging to a "classic strategic management approach" (Klimenko et al. 2015, p. 15). Thus labeling the system, they refer to the following works: Strumilin (1932), Ansoff (1965), and Christensen et al. (1965). Klimenko et al. (2015) claim that the "classic strategic management approach" has many pitfalls, the main one of which is the inability of the planning system to cope with external turbulence. They also mention the lower level of the flexibility of the system, and the weaker forecasting capacity with higher costs. The conclusion of the analytical part of the report is that adopting a classic strategic management approach exposes the planning system to the relevant and well-known risks of uncontrolled increase of running costs. The latter, with the system's expected ignorance of the implementation issues, should lead to

bureaucratization of the strategic planning practices and reduction in the value of the strategizing system, making it in fact not a strategic, but rather a "technical planning system" (Klimenko et al. 2015, p. 15).

In order to cope with the mentioned pitfalls of classic strategic management approach, the authors of the report turn to the concept of uncertainty, claiming that uncertainty should be the key factor in rethinking of state strategic planning. They call for the introduction of corporate practices into the work of government organizations, suggesting that the most advanced techniques are developed in private companies. The authors mention the resource-based view, the dynamic capabilities approach, interorganizational relations, and knowledge management as the key ideas relevant for adjusting the emerging strategic planning system to uncertain environment and turbulence. However, they say that these techniques require adaptation to the government organizations' specificity. Klimenko et al. (2015) refer to the following works: Duncan (1972) and Collis (1992) for the conceptualization of uncertainty; Beinhocker (1999), Kaplan and Beinhocker (2003), and Doz and Kosonen (2008) reflecting on their call for "real-time forecasting"; Beinhocker (1999) and Kaplan and Beinhocker (2003) as a new approach to understand the multiplicity of the future; Doz and Kosonen (2008) who suggest externalization and explorative approach to the information management.

Klimenko et al. (2015) insist on complementing the classic approach with techniques and instruments, assisting to navigate the state in turbulent environment. Thus, they suggest the so-called "integral" system of strategic planning that in addition to hierarchical order of documents has a strong focus on interaction among actors involved in strategy formulation and implementation, stimulates the involvement of private companies in strategizing, and employs various techniques of quality and performance management (Total Quality Management and process management, Key Performance Indicators, etc.). Besides, they suggest adding accent to organizational culture, develop foresight and forecasting techniques, and such models as robust and fast strategies. All these, they say, should make the system more flexible and increase the capabilities of handling various kinds of uncertainties.

## Conclusion

A quarter of a century since the collapse of the Soviet Union and 15 years after the start of recovery from the harsh economic crisis, the strong centralized Russian state again plays the key role in Russia. The background of Russia's state strategic planning system is based on the idea of a rational planning approach, suggested by Igor Ansoff (1965). Although the focus of Ansoff and his successors was mainly on how to make a corporation compete more successfully, the main idea of rational decision-making, as well as the implementation of these decisions, corresponds to the main ideas of the law. While many thinkers and strategists acknowledge and re-evaluate the Soviet experience of administrative planning, both at the instrumental and at the ideological level, this experience is not seen as the panacea for handling the current challenges Russia faces domestically and in the international arena.

## Synonyms

Crown corporations; Government business enterprises; Government-linked companies; Government-owned companies; Government-sponsored enterprises; Public corporations or Hybrid organization; Public enterprises; Public organizations; Public sector undertaking; State ownership of public utilities

## Definition

The enterprises where the government has ownerships.

## Introduction

State-owned enterprises (SOEs) represent a significant player with growing importance in the global and local economies nowadays. SOEs have different roles, from internationalization through foreign trade and investment, to promote economic development as part of national development strategies. The importance of SOEs in the global economy in recent years is increasing and mainly driven by the growth of emerging economies but also the impact of the global financial crisis on views on the role of the state in the economy.

## State-Owned Enterprises' Definitions from Different Perspectives (Governance, Accounting, and Statistics)

Many international and professional organizations define state-owned enterprises (SOE) in various ways depending on the objective targeted.

The Organization for Economic Cooperation and Development (OECD) defines SOEs as "enterprises where the state has significant control, through full, a majority, or significant minority ownership" (OECD 2005, p. 11). In this definition, two critical elements of SOEs are mentioned: control and ownership. Even if it seems to be bright enough, different countries had responded in various manners when they applied the OECD definition in their national legislation. Some jurisdictions took over the conditions provided by OECD, adding or no other vital elements as the legal form or activity (objectives), like Australia, Austria, Belgium, Czech Republic, Bulgaria, Romania, and Italy; other jurisdictions modified the conditions provided by OECD, adding a percentage of ownership/votes. For example, Estonia and Greece require more than 50% of share capital, in Hungary, companies in which the state owned at least 10%, and, in Slovenia, the state owns directly or indirectly at least 25% plus one vote of the total capital.

In the 2014 new guidelines on corporate governance of SOEs, there is an enhanced approach to SOEs concept. An SOE is "any state-owned

corporate entity recognized by national law as an enterprise" (OECD 2014). This concept includes joint stock companies, limited liability companies, partnerships limited by shares and statutory corporations with particular legal form, and mainly commercial activities. Each government is entitled to choose the recognition or not of other enterprises as SOEs depending on the judgment, "including regarding their degree of market orientation" (OECD 2014). The new perspective of OECD concerning SOEs comprises, besides critical elements as control and ownership, legal form and activity.

The World Trade Organization (WTO) pays attention to SOEs due to government's influence on world trade. They refer to SOEs using the term "state-owned transnational companies," including in this category all state trading enterprises that deal with goods for export or import (WTO 1994). This definition is not restrictive, and it uses just two critical characteristics of SOEs identified in the literature: ownership and activity.

The most complicated approach among international organizations concerning SOEs definitions is provided by the World Bank (WB). In the glossary of key terms, SOEs' description is based only on legal form and activity (commercial) criteria. But they created through their toolkit "Corporate Governance of State-Owned Enterprises – a Toolkit" (WB 2014) an overview which comprises the most important issues related to SOEs: areas in which SOEs operate, their importance and role in economies, performance, and the ownership and control issues. The toolkit focuses on commercial SOEs at the national level in which the government has significant control through full, majority, or substantial minority ownership. The toolkit mentions the fact that, depending on the country, the SOE can be broadly defined. The SOE is defined as "government-owned or controlled and that generate the bulk of their revenues from selling goods and services on a commercial basis, even though they may be required to pursue specific policy goals or public service objectives at the same time."

The European Commission (EC) through EUROSTAT provides a definition based on control and ownership criteria, like in the case of OECD. SOEs are considered: "enterprises controlled by the government directly (through nominating its representatives on the board) or indirectly (through state-owned funds and agencies) that they control affiliates in another country" (EC 2012, p. 32). The EC Directive No. 80/723 defines a public enterprise (the term used is undertaking) as "any undertaking over which the public authorities may exercise directly or indirectly a dominant influence by their ownership of it, their financial participation therein, or the rules which govern it." The novelty of definition consists in introducing the notion of direct or indirect control and approach identified in the academic literature with the focus on accounting and accountability.

While OECD defines SOEs from the governance perspective, The International Public Sector Accounting Standards Board (IPSASB) approaches it from an accounting perspective. IPSASB refers to SOEs using the term "governance business enterprises (GBE)." IPSAS 1 Presentation of Financial Statements define SOE as "an entity that has all the following characteristics: has the power to contract in its name; has been assigned the financial and operational authority to carry on a business; sells goods and services, in the ordinary course of its business, to other entities at a profit or full cost recovery; is not reliant on continuing government funding to be a going concern (other than purchases of outputs at arm's length); is controlled by a public sector entity."

Throughout time, IPSASB developed some projects aiming to set the conceptual delimitation of the term. The first consultation paper idea arose in 2008, but IPSASB discussed and approved a brief project on SOEs in March 2012, which started in December 2012. Initially, IPSASB considered four approaches to SOEs (IPSASB 2012): "(a) Do not specifically define SOEs but provide the high-level characteristics of entities; (b) Clarify the existing definition of SOEs; (c) Narrow the current definition; or (d) Redefine SOEs using a different approach e.g. based on services provided by entities or the objectives of entities. But, because it received little support, it was decided not to develop

further approach (d).” Then, in 2014, IPSASB suggests two main approaches. The first approach does not define the term; it produces a list of characteristics for public sector entities, while the second approach is modifying or narrowing the current definition presented in IPSAS 1. Both approaches have two sub-options, the differentiating criteria for them being the use of statistical terminology (IPSASB 2014). It could be observed that IPSASB definition concerning SOEs was initially based mainly on control, ownership, and activity criteria. In 2014, the IPSASB decision was to define SOEs using characteristics and to acknowledge the role of regulators in determining other specific elements that could help them in establishing which entities should be recognized as SOEs.

From the statistical point of view, there are two international frameworks (European System of Accounts, ESA, and System National Accounts, SNA) harmonized significantly. Although terms like GBE or SOE are not used, they refer to corporations and quasi-corporations that can be similar to SOEs when controlled by public sector units (EC 2010; UNSD 2008). The concept of control, from a statistical point of view, is “the ability to determine the general policy or programme of that entity” (EC 2010). Corporations are “created for the purpose of producing goods or services for the market that may be a source of profit or another financial gain to its owner(s), being collectively owned by shareholders who have the authority to appoint directors responsible for its general management” (UNSD 2008; EC 2010). Quasi-corporations “are unincorporated entities engaged in the production of market goods and services, managed like a corporation, having their own set of accounts” (EC 2010; IPSASB 2014; UNSD 2008). SNA and ESA divide public companies into financial and non-financial, depending on their activity (UNSD 2008), and this approach is also identified by IPSASB. However, the approaches of these two international organizations also include, alongside key elements such as control, ownership, and activity, a common point of view that SOEs must have the power to contract in their name (UNSD 2008; IPSASB 2014) although in certain countries, this can’t be applied due to national regulations. National accounts statisticians use a comprehensive definition of SOEs, including in this type of organizations all autonomous government companies (ownership criteria) with an independent budget and balance sheet, which generate at least half of their income through the commercialization of goods and services (activity criteria). The national authorities apply a restrictive concept, which is in many cases braced for SOE-related legislation (OECD 2014).

The International Monetary Fund (IMF) uses this term in the Governance Finance Statistic Manual (GFSM) 2014 creating a link between IPSAS and GFSM: “the IPSAS equivalent of a market entity, that is, a GBE” (IMF 2014, p. 352). The IMF is urging international standard-setters to collaborate on the side of aligning reporting standards for budget, statistics, and accounts.

## Key Elements of SOE

Overall, the international and professional organizations approach the SOE topic from governance, accounting, or statistical perspectives, based on key aspects of ownership, control, and activities developed.

The concept of ownership is crucial for defining SOEs. Ownership implies the responsibility for actions regarding the entity, whose rights are usually protected by law. Based on our analysis, we identified different approaches related to the ownership structure. The first approach recognizes as SOEs only those entities that are wholly owned by the government. By introducing the restrictive criteria of state ownership (100%), significant enterprises that still meet all other criteria are not recognized as SOEs, and consequently, the whole picture of the sector is patently distorted. The second approach focuses on SOEs as companies partially owned by the governments, introducing the hybrid character of SOEs. Hybrid SOEs have elements of state ownership on the one hand and private participation in ownership on the other hand, generate significant revenues, and represent some of the world’s largest firms.

From our point of view is a more reliable approach, considering that it acknowledges both types of state ownership (entirely or partially).

Discussing another essential key element, the notion of control, we identified two approaches analyzed among international and professional organizations:

- Policy control – from statistical point of view, a government exercises control under a corporation if the government can determine the general corporate policy.
- Financial control – from an accounting point of view, a government controls a company if it has the power to manage its financial and operating procedures to benefit from its activities.

There are two different types of control: direct and indirect. The differences between direct and indirect control are that under the first, the government has the power to set the organizational, social, and political objective of the SOEs, while under the second, SOEs would not be (anymore) to government control. As a subject of indirect control, SOEs are transformed from an integral part of state bureaucracy into independent legal entities, entailing substantial delegation of decision-making rights.

Party-state control of SOEs is a puzzle to many researchers. For example, Bird (2015) highlights the influences of party-state control and how it works: governments still have the power to control the long-term policies of the subjected SOE, while the board is responsible for the short-term strategies. There is a belief that due to economic difficulties, the state often cannot adequately support these activities, resulting in a mixture of public and private ownership. However, it is crucial that the government remains in control, being able to intervene when deemed necessary to do so, to defend national interests. In other words, using control as the essential element, SOEs can be defined as enterprises either wholly or partially owned by the state, in which control is exercised directly by the government when it comes to significant policy changes or delegated to the SOEs board's members.

Also, market- and nonmarket-oriented activities are concepts used by international and professional organizations in defining SOEs. SOEs are performing commercial operations or noncommercial activities. Although SOEs were created to pursue goals other than profit maximization, they became much more but yet not wholly market-oriented.

From a legal point of view, the SOEs' legal form is a use of one specific regulation for this kind of enterprises or the use of the corporate law. In some jurisdictions, SOEs are regulated by the corporate legislation while in other jurisdictions are specific legal frameworks for SOEs tailored in accordance to their particular characteristics.

## SOE Concept in Academic Literature: At the Border of Public-Private Sector

Being at the boundary between public and private sector, SOEs were defined and described in the academic research in a variety of approaches: "public companies limited by shares and organised under the corporate law", "involved in international activities" (Wettenhall 2004) which "had to compete against the private sector" (Coates 1990). Analyzing the definition used by Coates and Wettenhall, it can be observed that government business enterprises are not (anymore) recognized as a part of the public sector. Due to the changes that arose through public sector reforms, they started to apply and to be organized under private law. But, even so, government business enterprises are public companies which act at the intersection of the public and private sector, because the public ownership requires more than in the private sector. It implies a social responsibility for their decisions, trust for their actions, and transparency for the use of public money.

Some authors are using the notion of "public enterprises" when referring to SOEs. But Thynne and Wettenhall (2001) state that the use of the term "public enterprises" is inaccurate in referring to a particular organizational category. Public enterprises are "established through regular

company formation procedures" and represent a "functional category conducted by the government (national, regional or local level) or another non-departmental-organization, with functions such as commercial, executive, regulatory, adjudicative, appellate or advisory" (Wettenhall 2004). By this definition, the interdisciplinary character of SOEs is underlined. Another essential aspect endorsed by them, but disapproved by others (primarily by researchers focused in accounting and accountability topics), refers to the fact that public enterprises are conducted by governments (national, regional, or local level). The first consequence of these contradictory statements leads to important gaps in identification, definition, and organization of these types of companies.

From another point of view, SOEs are considered "hybrid organizations that have elements of state ownership and control on the one hand and private participation in ownership and control on the other" (Bruton et al. 2015). Being created by the government and operating in both the market and public sector (Grossi and Thomasson 2015), these hybrid organizations are structured and managed according to the private sector but created to address public needs, in an attempt to increase the efficiency of the public sector. With a long history in the USA, they were designed to accomplish specific policy objectives while achieving performance requirements related to the policy objectives. The term "hybrid organizations" focuses and succeeds highlighting the position of these types of companies into the public and private sector. Moreover, through the term "hybrid," they recognize not only the positioning element but also the activity (split between market and public sector) and legal form element (created by governments but organized according to the corporate law).

## SOEs' Role in Economies

State-owned enterprises (SOEs) play a notable role in the economy representing an important part of the whole government activities, performance, and financial position.

SOEs are entities with a large number of social/political roles and obligations, with high strategic importance for national security, and domestic and economic livelihood (Chan 2009). SOEs could have different or a mix of economic, social and/or political objectives, depending on their holders' aspirations, promoting social and political unification, securing national defense and related to strategic considerations. SOEs are recognized as useful strategies to pursue social goals. The United Nations by the Department for Economic and Social Affairs considers SOE a public investment that can further enhance economic development especially if they are made in areas that complement private sector investment (e.g., road facilities for significant export crop region, investment in the training of engineers for a newly expanding industry, investment in the primary input industries that are too risky for the private sector).

SOE role in the economy is mainly linked with privatization and nationalization reforms but also with strategic domains. Privatization reform is seen as an improvement of SOEs' governance, as a step before private sector participation, and performance. Contrarily, others consider that privatization is not the sole right solution for restructuring public enterprises. They argue that services could be more efficient if provided by for-profit entities rather than subject to ministerial control and government interference (Luke 2010). The nationalization of some traditional public service activities is another topic of interests for researchers. Several governments temporary nationalized private companies (banks, manufacturers) to face the economic crisis better.

Additionally, there is the conviction that the externalization of public sector opened new accountability gaps, regarding decreased transparency on the financial performance and position of public services, as a result of fragmentation of activities, services, responsibilities, and financial statements as well as to

probable misalignments between governmental and service provider's expectations. An expanding concern related to what exactly publicly owned entities should be included in the reporting entities remains in debates. The controversy levitates around SOEs. Several authors from the public sector accounting and management area and, moreover, relevant international and professional organizations raised the issue of defining SOEs as a real concern.

In the majority of economies, the SOEs are highly concentrated in strategic sectors on which large parts of the private economy depend, and half of SOEs by value operates in the network industries (telecoms, electricity and gas, transportation, and postal services).

## Conclusion

Due to the importance of SOE in the economy, many international and professional organizations dedicated rooms in their agenda to SOE and developed projects on SOE reform area in different countries.

SOEs as companies established to pursue public policy and commercial objectives proves their ability to operate in many vital sectors, aiming to provide a variety of services and goods. But SOEs are not exposed to pressure from the stock market; we can deduce that even if a SOEs could have commercial activities, they still have a particular statute in the public sector, and their commercial characteristic doesn't imply the same obligations and rights like in the private sector.

The critical elements of SOEs are ownership, control, objective, activity, and legal form. Even if the definitions provided by authors usually approach the term by combining at least two of the identified critical elements, SOEs are non-uniformly understood and defined by researchers.

As a conclusion, we could acknowledge that SOEs serve as economic, political, and socio-economical spheres of society, reflecting the multipurpose reality of society.

## Strategic HRM Approaches

Cristal Beddeau
Department of Political Science, The University of the West Indies, St. Augustine, Port of Spain, Trinidad and Tobago

### Synonyms

Strategic management; Strategy and HR function; Strategy and HRM

### Definition

Strategic human resource management (SHRM) refers to the process of aligning an organization's overall strategy with its human resources practices to achieve the strategic goals of the organization. The concept identifies an organization's strategy linked to human resource processes that affect how people should be managed effectively toward the achievement of organizational strategic goals. The central idea is to tie the methods, tools, and functions of HRM to the overall strategy of the organization. SHRM describes that HR role is not only to manage recruitment, compensation, and other personnel matters but also to take on a more proactive, forward-looking approach to addressing the future needs of the organization and its employees.

### Introduction

An increasing interest in the strategic management of state enterprises has become more apparent in the last decade or so. The paradigm shifts first from traditional personnel management and then to human resource management, and now at length, strategic human resource management continues to have significant implications for strategic goals and practices in the development of public organizations like those of state enterprises. Changes in the historical development and evolution of HRM from old public administration to strategic management have therefore gained momentum for the public sector. State enterprises in particular are required to consider how their people are managed and need to be aligned with and in support of the organization's overall strategy (Sutiyono 2007). Consequently, a better understanding of SHRM and its effective integration into public management practices has major implications for managers, public officials, and other professionals to develop strategies for better quality performance and sustained competitive advantage in the country's public sector characterized by environmental changes.

This entry provides an analysis of SHRM approaches in relation to its potential impact on state enterprises in the context of Trinidad and Tobago. It considers the historical development of SHRM from the early stages of personnel management to contemporary practices in SHRM and presents a brief review of the composition of state enterprises in Trinidad and Tobago. The entry also identifies strategic themes that have emerged in human resources and have potential implications for public enterprises. The analysis will be based on a framework exploring three important dimensions of SHRM in relation to state enterprises: public leadership, ethical practices, and employee engagement. Research findings may help to improve knowledge about the strategic practices of effective public leadership, the administration of ethical principles, and the role of employee engagement as critical factors in enhancing competitive advantage and high-performance work systems in support of state enterprises' overall strategy.

## Definitions, Evolution, and Historical Background of SHRM

Despite being expansive in the literature, SHRM nonetheless faces difficulties in its own interpretation, clarity, and multiple use of meaning. This section focuses on defining the foundation concepts of SHRM. It will outline the historical perspectives in the development and evolution of SHRM from traditional personnel management to contemporary strategic human resource management. It will also present a definition of state enterprises in the context of the study.

### Personnel Management (PM)

Personnel management also commonly referred to as old public administration appeared in theory in the 1960s–1970s. It spawned from the human relations movement which began in the early twentieth century fuelled by the scientific management era, the Hawthorne studies, Weber's bureaucratic theory, and other motivation studies like those of Maslow and Herzberg (Obedgiu 2017). PM is generally referred to as the management of human resources. The aforementioned was based mainly on and strongly influenced by the ideas of Max Weber's model of bureaucracy grounded on principles of hierarchy and meritocracy. It was initially introduced as part of wide-ranging bureaucratic reforms in the United Kingdom and the United States in the late nineteenth century to overcome patrimonial systems of administration where patronage and favoritism dominated government decisions and public appointments. The PM approach had a number of distinctive characteristics. It relied heavily on centralized control, set rules and guidelines, separated policy making from implementation, and employed a hierarchical organizational structure (Osborne 2006; Dunleavy and Hood 1994). The watchwords were efficiency and effectiveness in the control, budgeting, and management of human resources.

Some writers show that the personnel function was never considered a part of the strategic management of organizations. During the 1960s–1970s, human resource managers were mostly seen as performing the administrative function; often its importance as a strategic partner was neglected (Aswathappa 2005; Khan and Mushtaq 2015). HR's role was essentially regarded as one of transactional rather than transformative. PM placed heavy emphasis on methods of supervision, maintaining the status quo and carrying out mundane organizational activities in contrast to measures used to enhance effective leadership skills, maintaining ethical standards, and engaging employees to achieve competitive advantage and high-performance work systems in support of the organization's overall strategy (Storey et al. 2009; De Souza Freitas et al. 2011). Historically, personnel management preceded human resource management.

### Human Resource Management (HRM)

In the last two decades of the twentieth century, the shift from personnel management to human resource management led to some changes in the conceptual framework of human resources. From the 1980s onward, the HRM function was mainly directed toward the needs of management for the provision and use of human resources (Aswathappa 2005; Durai 2010). HRM has been used to refer to the functions performed in an organization that facilitates the most effective use of people and its employees to achieve organizational and individual goals. It is in essence, a management function that helps managers plan, recruit, select, train, develop, remunerate, and maintain members of an organization. HRM's primary objective is to ensure the availability of a competent and willing workforce to an organization. Human resource management consists of numerous functions devised to maximize the most effective use of its employees and carry out its core objectives, namely, those that are societal, organizational, functional, and individual (Aswathappa 2005; Ivancevich 2013). These functions correspond to the four main objectives of HRM as outlined in Table 1.

Characteristics of the HRM concept are wide ranging and can be summed up as the belief that employees should be treated as assets; responsibility for human resources lie in line managers, management-driven activity, and better performance as overall objective; and the role of the

HRM area is to respond to needs and control through rules, policies, and position power (Armstrong 2006).

From the 1980s onward, HRM has largely replaced the term personnel management as a wider description of the processes involved in managing people with relative adjustments to the HR function. Table 2 highlights some of the key differences between PM and HRM. While the primary objective of HRM is to ensure the availability of a competent and willing workforce, the question arises as to whether public sector HRM measures have been used to promote better leadership, to administer ethical practices, and to engage employees in gaining competitive advantage and optimal performance in support of the organizations' overall strategy. The late twentieth century and earlier parts of the twenty-first century would see a growing recognition of the shifting role of HRM from a macro perspective to one more focused on strategy at the micro or sub-level fuelled by significant changes in the external environment.

| Individual objectives | Training and development<br>Performance evaluation and compensation<br>Safety, health, and wellness |

## Strategic Human Resource Management (SHRM)

The human resource management field has evolved with the development of strategic management of organizations. According to Wright and McMahan (1992), this led to the birth of the strategic human resource management (SHRM) discipline. The important defining characteristic of human resource management is that it is strategic, emphasizing on strategy in HR (Akhtar et al. 2008). The SHRM perspective advances that human resources not only manage recruitment, compensation, and other personnel matters but also take a proactive, forward-looking approach to addressing the future needs of the organization and its employees (Battaglio 2015; Wright and Ulrich 2017).

Strategic human resource management can be understood as a process of aligning the organization's overall strategy with its human resources practices to achieve the strategic goals of the

**Strategic HRM Approaches, Table 2** Differences between personnel management and human resource management

| Elements | Personnel management | Human resource management |
|---|---|---|
| 1. Approach | Reactive | Proactive |
| 2. Role of HRM area | Resource-centered (focuses more on managerial aspects of delegating responsibility) | Employee-centered (aimed at hiring, training, compensating, and maintaining the existing workforce) |
| 3. Objective | Better performance leads to job satisfaction and morale | Job satisfaction and morale as source of better performance |
| 4. Reward management | Use of autonomous work groups, challenging jobs, and creativity for motivating people | Monetary rewards and job design techniques like job simplification and rotation to encourage people to improve their performance |
| 5. Treatment of employees | Employees as assets. HRM seeks to develop employees' competencies on a sustained basis | Employees as tools. PM practiced a regular status quo administrative function of ensuring that employees serve the interests of the organization based on job evaluation and job worth |

**Strategic HRM Approaches, Fig. 1** A model of strategic HRM

organization. This process includes all initiatives involving how people are managed and aligned with and in support of the organization's overall strategy (Dyer 1984; Boxall 1992). The central idea is to tie the methods, tools, and functions of HRM to the organization's strategy. The SHRM process is presented as a series of five steps as outlined in Fig. 1 (Mello 2011).

To best understand HRM and its strategic role, it is important that to consider that the SHRM process operates from the strategic organizational level and incorporates all other levels of management, i.e., the tactical and operational levels within the organization. Figure 2 illustrates the three major levels involved in the SHRM process (Jofre 2011).

Characteristics of the SHRM approach as they emerged from strategic management theoretical frameworks are many and can be summed up as being closely associated with goal-setting, policy formulation, and allocation of resources performed at top management levels, fulfilling the long-term HR requirements of the organization, interrelating with business strategies to specific HR activities (e.g., recruitment, training, performance evaluation), and incorporating strategy formulation tasks with other supportive levels of management (tactical, operative), and employees are viewed as the strategic capability of the organization (Legnick-Hall et al. 2009).

The SHRM approach reinforces that HR has a strategic role in the performance of the organization. It is clearly a process of aligning the organization's overall strategy with its human resources practices to achieve the strategic goals of the organization (Boxall 1992). What differentiates SHRM from traditional HRM is its shift of focus from a macro approach (organizational) to one that is micro in nature or sub-field (strategic) (Wright et al. 2018). Table 3 highlights some of the differences between HRM and SHRM. Further research findings later hope to suggest that a clearer understanding of SHRM and its effective integration into public management practices has major implications for managers, public officials, and other professionals in developing strategies for better quality performance and sustained competitive advantage in the country's public sector context (Knies et al. 2018).

## State Enterprises

The mid-twentieth century saw the management and creation of state enterprises particularly in developing countries, fostered by the notion that state intervention was necessary and essential to fix market failures. This idea was based on the

**Strategic HRM Approaches, Fig. 2** The three main levels of management involved in HRM's strategic role

**Strategic HRM Approaches, Table 3** Differences between HRM and SHRM

| Elements | Human resource management | Strategic human resource management |
|---|---|---|
| 1. Major emphasis | Managing employees | Gaining competitive advantage |
| 2. Responsibility of management | Developing functional competencies relating to HR aspects | Developing overall strategic competencies from the HR perspective |
| 3. Time focus | Short term | Short, intermediate, long term |
| 4. Outcomes | Focuses on human resource-level outcomes | Focuses on business-level outcomes (competitive advantage) |
| 5. Treatment of employees | Employees as tools of production and headcount resources | Employees as human capital and precious resources to be strategically invested in |

belief that state enterprises form monopolies, which needed to be regulated by the state in order to effectively provide efficient public services (IDB 2015). The historical timeline indicates that since the 1930s and particularly after World War II, numerous state-owned enterprises (SOEs), also referred to as public enterprises, were created in both developed and developing countries to address market deficits and capital shortfalls, promote economic development, reduce mass unemployment, and ensure national control over the overall direction of the economy (Khan 2007). By providing capital and technology to strategic areas where the private sector either avoided or lacked the capacity to invest, most governments resorted to SOEs to increase capital formation, produce essential goods at lower costs, create employment, and generally contribute to the economic development of the nation state.

A state enterprise can be generally defined as an institution or organization which is controlled by the state or one in which that the government holds a majority interest, whose activities are business oriented, and which provides services and goods to meet the interests of the public. They operate on a full or partial self-financing basis, i.e., either whole or most of the investment is made by the government, and in which the government or public body/agency participates by way of having shares or representation in its decision-making structure (Nnamdi and Nkwede 2014). Drawing from the varying conceptualizations of public entities, some key elements of state enterprises comprise the following features: state ownership, financing from state resources, service objectives monopoly enterprises, and autonomous or semi-autonomous bodies (Shleifer 1998; Nnamdi and Nkwede 2014).

While state enterprises form an important part of the economic equilibrium of a state's macroeconomic policy, their significance to national development in recent times have begun to diminish. Although they promote economic development by providing society with public goods such as energy, water, telecommunications, finance, and transport, several challenges have emerged overtime reducing the significance and desire for the management of SOEs for which they were initially created for. Some of these can be identified as rising corruption, management inefficiencies, overstaffing, inflation, technological shortcomings, and excessive political interference (Shleifer 1998; Nnamdi and Nkwede 2014).

Despite the apparent challenges facing SOEs, there are public concerns for a re-examination of the influence and impact of state enterprises' performance on State economies (Owen 2018). Contrary to what has been commonly perceived, some studies suggest that SOEs are not stagnant state vestiges waiting to perish. Public concerns relating to the management and performance of SOEs are valid, especially since these enterprises provide an important segment of production and employment and they have enormous effects on fiscal accounts on the economies in all countries in which they operate (IDB 2015).

## Case Study: State Enterprises in Trinidad and Tobago

State enterprises have grown to play a central role in the national economies of many of the Commonwealth Caribbean territories after independence. The case of Trinidad and Tobago, for example, like many of the other former British colonies after a legacy of slavery, colonialism, and Crown Colony Government resulted in the adoption of alternative development strategies in the economic, social, and political development in the Caribbean region (Barrow-Giles 2002; Minto-Coy and Berman 2015). Governments created SOEs to carry out productive or service-based activities in sectors such as energy, water, telecommunications, finance, and transport. Several governments promoted specific industries to achieve social and economic development goals. For example, in the post-independence era, during the 1970s, the Republic of Trinidad and Tobago used its state enterprises to promote the spirit of nationalism. Nationalist objectives were the motivating forces in the government's economic and social development of the country (Barrow-Giles 2002).

Currently, at the national level there is a total of one hundred and sixteen (116) state enterprises as indicated in the Ministry of Finance – State Enterprises Board of Directors Listing as of September 2019 (Ministry of Finance 2008). Table 4 illustrates the composition of state enterprises in Trinidad and Tobago, the different sectors and spectrum of activities to which they embody.

The official closure of the Petroleum Company of Trinidad and Tobago Limited (Petrotrin), a state-owned oil company in Trinidad and Tobago and the country's largest refinery, on 30 November 2018 marked the end of its reign and operation of 101 years in oil refinery. The company's principal activities were the exploration, development, and

**Strategic HRM Approaches, Table 4** Composition of SOEs in the different sectors in Trinidad and Tobago

| Sector | Total number of SOEs |
|---|---|
| Public utilities (e.g., electricity, water) | 4 |
| Energy (e.g., oil, gas) | 34 |
| Telecommunications | 2 |
| Banking and finance | 17 |
| Public transportation | 4 |
| Infrastructure in transport | 4 |
| Radio and television | 1 |
| Manufacturing, trade, and industry | 20 |
| Research and education | 5 |
| Agriculture and land | 5 |
| Community development and culture | 2 |
| Tourism | 3 |
| Health | 2 |
| Housing and development | 8 |
| Rural development | 2 |
| Sport and youth affairs | 1 |
| Planning and development | 2 |

production of hydrocarbons in addition to the manufacturing and marketing of petroleum products.

Petrotrin reflected the embodiment of poor corporate governance, expressed in bad policy decisions, wastage, corruption, and nepotism across governments. The Oilfield Workers' Trade Union's power over the company due to consolidation of past state oil companies made it even more difficult for management to institute changes. On 28 August 2018, it was announced by Prime Minister Dr. Keith Rowley that Petrotrin would have to be dissolved because of the company's inability to generate a profit during a period of low oil prices where TT$8 billion was lost over 5 years. Also cited by the government was the lack of competitiveness, declining production, TT$12 billion in debt, and the loss of foreign exchange due to the importation of oil to be used together with locally produced oil to keep the refinery in operation. A cash injection of $25 billion would be required to refresh its infrastructure and repay its debt. On 30 November 2018, Petrotrin was officially shut down with approximately 5,500 permanent and temporary/casual employees losing their jobs.

Petrotrin has divided into four new companies that have become effective from 1 December 2018. These comprise Trinidad Petroleum Holdings Limited responsible for legacy matters such as settling outstanding financial debts by Petrotrin and the parent company of the following three companies: Heritage Petroleum Company Limited that deals with exploration, development, production, and marketing of crude oil; Paria Fuel Trading Company responsible for trading and marketing of imported fuel products; and Guaracara Refining Company that deals with the Pointe-a-Pierre refinery and related assets to be offered for sale. As a state enterprise, Petrotrin was under the direct control of the Minister of Finance acting as the corporation sole and the Ministry of Energy as the line ministry that provides specialized technical analyses and statutory approvals for the company's operations.

In an effort to reconsider the priorities of state enterprises such as Petrotrin and their capabilities in enhancing, if at all, their competitive advantage and high-performance work systems as public organizations, one must examine the strategic practices of HRM as they relate to the impact and performance of SOEs. Potential areas of interest in SHRM in aspects of public leadership, ethical practices, and employee engagement may well prove to be critical in understanding the context of Trinidad and Tobago's state enterprises and their ability in gaining competitive advantage and high-performance work systems significant to national development.

## Potential Areas of Interest in SHRM and State Enterprises

This section briefly identifies three potential issues that can have a significant impact on SHRM practices in state enterprises. It will highlight the important issues of public leadership, ethical practices, and employee engagement as critical factors in enhancing the competitive advantage and high-performance work systems in support of state enterprises' overall strategy.

### Public Leadership

The need for increased public leadership strategies in public organizations to achieve competitive advantage and high-performance work systems appears to be critical in today's context of state enterprises. Public managers are responsible for taking initiative for addressing large-scale challenges and opportunities (Berman et al. 2013). It is generally understood that effective leadership provides higher-quality and more efficient goods and service; it provides a sense of cohesiveness, personal development, and higher levels of satisfaction among those conducting the work; and it provides an overarching sense of direction and vision, an alignment with the environment (Van Wart 2003). The three-tier fold of management (i.e., strategic, tactical, operational) particularly the strategic top-level act as crucial players in strategically determining what needs to be done to achieve corporate objectives and more importantly, how these objectives are to be realized (Mello 2011). It is the intention of this study in future discussions to understand the important role of

public leadership in enhancing the competitive advantage and high-performance work systems in support of state enterprises' overall strategy.

### Ethical Practices

The importance of the administration of ethical practices is critical in enhancing overall organizational performance in public organizations. It is vital that organizations set ethical principles and moral standards for management and employees alongside providing an environment that fosters trust and commitment, provides leadership, and creates a high quality of workforce to improve organizational performance (Berman and West 1997; Hijal-Moghrabi et al. 2015). Further, setting ethical standards to match human resource strategies are critical to avoid or correct ethical wrongdoing (West et al. 2013). Additional work on this study intend to show that human resource professionals can play a greater role in contributing to organizational success if they are effective in developing and administering ethical principles and practices that are aligned with the organization's overall strategy and goals (Bowman and Williams 1997; Caldwell et al. 2011).

### Employee Engagement

Employee engagement is one of the key determinants fostering high levels of employee performance (Mohapatra and Sharma 2010; Anitha 2014). The engagement of employees, their level of commitment and involvement as critical human assets in the development of their organization, and its strategic goals are important in developing high-performance work systems and competitive advantage (Huselid et al. 1997; Saks 2006). It is the intention of future research to consider the relationship and significance between employee engagement practices and organizational performance in state enterprises achieving competitive advantage and high-performance work systems in alignment with the organization's overall strategy.

## Conclusion

To conclude, this entry provided an analysis of the field of strategic human resource management (SHRM) in relation to its evolution and potential impact on state enterprises in Trinidad and Tobago. It traced the theoretical development of SHRM from the early stages of personnel management to contemporary practices in SHRM. The entry provided a review of the composition of state enterprises in Trinidad and Tobago. The entry also showed how strategic themes in human resources have developed and what these approaches imply for public enterprises. The analysis was based on a framework exploring different dimensions of SHRM as it relates to state enterprises in aspects of public leadership, ethical practices, and employee engagement. Research findings later hope to suggest that the strategic practices of effective public leadership, the administration of ethical principles, and methods of increasing employee engagement are critical factors in enhancing the competitive advantage and high-performance work systems in support of state enterprises' overall strategy.

# Strategic Management in Public Administration in Russia

Alexandra Shubenkova
Laboratory for Political Studies, National Research University Higher School of Economics, Moscow, Russia

S

## Synonyms

Governance; Planning; Strategy

## Definition

Strategic management and strategic planning in public administration are taken as synonyms and

understood as a managerial procedure of formulation, implementation, and evaluation of strategic documents.

Strategic document is a text issued by executive authorities which includes goals and targets for a defined period of time, measured by some indicators, which are used to develop and implement public policies and development goals.

The current article describes the state of the art, institutional design, and a historical overview on how strategic management in public administration developed in post-Soviet Russia till 2017. Strategic attempts in public administration run contemporarily, and they evolve. After the 13th 5-year Soviet plan was revoked in 1991 along with the collapse of the Soviet Union itself, it took Russia 9 years to come back to the concept of planning as a governing procedure. Since then, Russia had several iterations in the development of a national long-term strategy and performed vast activity in introduction of strategic routines into public administration. As for the end of 2016, Russian system of strategic management in public administration is passing through an institutional reform.

The milestones which shaped the model of the Russian public strategic management and the key documents are as follows:

1995 – Adoption of the Federal Law №-115, dated July 20, 1995, on public forecasting and programs of socioeconomic development of the Russian Federation (later in the text – the Federal Law №-115).

1999 – The first post-Soviet strategy of socioeconomic development till 2010: it was announced but not adopted as any official document (later in the text – the Strategy-2010).

2008 – The concept of long-lasting socioeconomical development of the Russian Federation till 2020: a government order №-1662, dated November 17, 2008 (later in the text – the Concept-2020).

2009 – The Presidential Decree №-536 "About the foundations of the strategic planning in the Russian Federation," dated May 12, 2009.

2011 – Strategy-2020: an updated version of "the Concept-2020" developed within a public campaign of revision by a wide expert panel. Not adopted as any official document (later in the text – the Strategy-2020).

2012 – Presidential Order №-596 "On long-lasting state economic policy," dated May 7, 2012. It is one of the packages called "the May Decrees of the President": 11 decrees by President Vladimir Putin, which he signed immediately on the first day at his third presidency on May 7, 2012 (later in the text – the May Decrees-2012). Though formally the May Decrees-2012 are not strategic documents in the common sense, they play a strategic role, which is described below.

2014 – The new legal framework "On the state strategic planning in the Russian Federation" (the Federal Law №-172, dated June 28, 2014) which is the current principal clarification of the strategic management system (later in the text – Federal Law №-172).

Since the adoption of the Federal Law №-172, Russian executive bodies of the federal, regional, and municipal level systematize and update an existing corpus of their strategic texts to bring them into accordance with the requirements, settled by the Federal Law №-172. They also adopt their relevant legislation to establish executive processes in strategic management.

The above list of the milestones reveals that in the post-Soviet period till 2017, there are four times when Russia had national long-term strategies of socioeconomic development on public agenda. The strategic texts differ by their formal status. Only two documents became official: the Concept-2020 and the May Decrees-2012. And the other two remained as drafts: the Strategy-2010 and the Strategy-2020. Additional to these long-lasting national level planning texts, the corpus of strategic documents also comprise midterm and short-term strategies and state programs, implicitly formulated in accordance with the long-lasting strategic document, forecasts, plans of activities of executive bodies, territorial and budget plans, doctrines, conceptions, foundations, and some others. The question is how they are connected and what governing potential they possess.

## Legal Framework

The evolution of the Russian legal framework for strategic management in public administration evolves along with the praxis. Currently, Russia makes efforts in institutionalization of strategic management by the adoption of relevant national legislation and formalization of strategic management as a bureaucratic routine.

Since 1995 till nowadays, all the strategic management initiatives in Russia were implemented under three basic thematic regulative documents. Since 1995 till 2009, strategic management in public administration in Russia was shaped by the Federal Law "On public forecasting and programs of socio-economic development of the Russian Federation" №-115 dated July 20, 1995. The Federal Law №-115 had no clarifications on the legal place of strategies, plans, and concepts in Russian policy cycle. Importantly, it set annual presidential messages (*poslaniya prezidenta*) as a source for long-lasting development goals.

On May 12, 2009, President Dmitry Medvedev signed Presidential Decree №-536 "About the foundations of the strategic planning in the Russian Federation." The decree was restricted for publication (by a stamp "for staff only") and was not officially issued, though its text is available online (later in the text – the Decree №-536). The Presidential Decree №-536 regulated how the existing corpus of strategies, concepts, foundations, programs, and presidential messages are connected with each other. It redistributed authority in strategic planning between public stakeholders. Till 2009, the government and the prime minister had a key role in setting strategic goals. Since the Decree №-536, the authority of the goal setting was shared between "the President within the Security Council of the Russian Federation" and the Security Council instead of the government. Following that the Security Council is appointed by the president, it means that with the Decree №-536 the government lost its influence on strategic planning. Additionally, it became mandatory that strategic documents have to reflect strategic goals announced in the annual presidential messages and the strategy of national security. The presidential messages and the strategy of national security are technocratic documents formulated under the guidance of the presidential administration with neither prescribed involvement of other pubic actors nor transparent procedures of formulation.

The rigorous regulation of strategic management was created by the new Federal Law №-172 "On the state strategic planning in the Russian Federation," dated June 28, 2014. The Federal law №-172 abolished the previous framework and provided a comprehensive list of strategic documents, their hierarchy, and procedural clarifications. It specified the interconnection between strategies of federal, regional, and municipal levels and thus provided the integrity of the strategic objectives within the hierarchy of strategic documents. It obliged federal regional and municipal levels of power to formulate their strategies with the strategic goals sourced from the national level strategy of socioeconomic development. The Federal law №-172 simplified the distribution of authority and left the annual presidential messages as a single source of the national long-lasting goals which are stated in the state long-lasting strategy of socioeconomic development. Thus, in such or other form, the supreme authority in defining the strategic aims of socioeconomic development was passed to the president. The Federal Law №-172 reserved the period till 2017 for preliminary administrative changes and adaptation of the existing system to the new design. However, these deadlines were later postponed till 2019.

Therefore, along the time the control over strategic management in Russia was centralized under the presidential authority, and since 2014 the annual presidential messages normatively became a key source of long-lasting development objectives. But despite this integrative intention in the new legal framework, the normative force of strategic documents in the system of decision-making and policy remained weak. The Federal Law №-172 neither granted funds to strategy implementation nor clarified obligations of executive bodies to settle policies in accordance with the strategic texts. Also, no clear sanctions for policies which contradict strategic documents were introduced. Such placement of strategic

documents in the policy cycle leaves them low institutional autonomy, thus reducing the potential of strategic management to become an institution of development.

## Historical Evolution of Strategic Management in Russia

The Strategy-2010 was developed as a part of Vladimir Putin's first presidential campaign. In 1999 the Centre for Strategic Research got a request to develop a 10-year plan for a candidate to the Russian president post Vladimir Putin. By that moment Putin was a technocrat with a drastic career jump to the head of Federal Security Service (FSB) and later to the prime minister during Boris Yeltsin's presidency. Some claimed Putin's strategic initiative as a way to build coalitions with political elites in his preelection campaign and to create an image of a candidate with a strategic view. The Strategy-2010 remained unofficial and was not adopted.

Then in 2008 the Concept-2020 was approved (government order dated November 17, 2008 №1662-р). The Concept-2020 was a first official national level document of long-lasting strategic planning in the post-Soviet period. In connection with the 12-year strategy, a 4-year plan was adopted. Every 4 years the Concept-2020 expected a revision; thus, the first review was scheduled for 2012. The scheduled update looked reasonable in times of global economic downturn which affected Russia as well. In 2011, Putin, who was holding prime minister's chair at that time, publicly stated that the Strategy-2020 should be discussed openly for public and should be adopted. In accordance with the schedule, in 2011 a wide panel of experts assembled and organized 21 open parallel thematic subgroups to renovate pre-crisis version of the Concept-2020. After less than a year of open public expertise, the Strategy-2020 was announced. It was not a pure "strategy," rather an expert draft with scientific argumentation. The Strategy-2020 was neither officially approved and remained as a draft nor applied for the Concept-2020 revision. The Concept-2020 still remains in force in its pre-crisis version. Formally it remains the running version of Russian strategy till 2020. Meanwhile, a new version till 2035 is under development.

In May 2012 Putin started his third presidential term. At the first day of the term, Putin signed 11 presidential decrees (the May Decrees-2012), devoted to the long-lasting development of Russia in different spheres (social policy, education and science, and health care among them). The Decree №-596 "On long-lasting state economic policy" was an umbrella document for the rest ten sectorial ones. So, later in the text "the May Decrees-2012" imply only the Decree №-596. The Decree №-596 and the Concept-2020 rested simultaneously in force as formal official documents. But they had different normative power in the state document hierarchy. The Concept-2020 was signed as a government decree, the May Decree-2012, as a presidential decree possessing higher normative power. Thus, till nowadays the May Decrees-2012 remain at the highest official status among existing strategic documents. Can it be accounted as a strategy? Formally and institutionally, it should not. The May Decrees-2012 are adopted beyond the existed by the moment legal framework for strategic routines, i.e., Federal Law №-115 and Decree №-536. So although it brings a set of goals for midterm and long-lasting horizon, formally it does not belong to the corpus of strategic texts. However, the May Decrees-2012 possess high political power, so it can be classified as a "manual" strategic management.

In 2014 the new round of revision of the Concept-2020 was initiated with the adoption of the Federal Law №-172. As for the mid-2017, the Concept-2020 remains in pre-crisis version. The deadline for its update was postponed till 2018 for the national level strategy revision and till 2019 for sub-federal level documents. The Federal Law No-210 "On the amendments to the Federal law" "Đžn the state strategic planning in the Russian Federation," dated June 23, 2016 (later in the text – the Federal law №-210), provides clarifications of the new deadlines. The new strategy is being developed.

## Organizational Design and Implementation of Strategic Management

The Federal Law №-172 settled a legal framework which unified the standards and created single rules and procedures of formulation of the documents of long-lasting planning. The current corpus of strategic texts on the national level includes 16 kinds of strategic documents on the national level, 7 kinds on the sub-federal regional level, and 5 kinds on the municipal level, though the list of strategic documents remains open-ended (Klimenko et al. 2016).

In public administration theory, strategic management cycle is comprised of three stages: strategy formulation, implementation, and evaluation. The Federal Law №-172 suggests an alternative terminology for the order in the strategic cycle: (1) target-setting stage, (2) prognosis stage, and (3) planning and programming stage. Thus, the Federal Law №-172 divides strategic documents into four groups: goal setting, forecasting (prognosing), programming, and planning. Goal-setting group consists of strategies of socioeconomic development (the running one is the Concept-2020), strategy of spatial development, strategies of socioeconomic development of macro-regions (macro-region should not be equaled to federal regions), and schemes of territorial planning on federal, regional, and municipal levels. Forecast group consists of the forecast of scientific-technological development of Russia and forecast of socioeconomic development for long-run period. Strategic planning group consists of state (national) programs, basic directions of government activities of the Russian Federation, and executive plans of federal authorities. The corpus also comprises midterm strategies. The prescribed set of strategic documents is equal for national, regional, and municipal levels. The Federal Law №-172 was aimed to establish clear interconnection inside the enormous corpus of strategies and relevant documents. However, this integrative and clarifying intention leaves much space for development.

The methodology of strategy formulation defines the president as a source of goal setting. Every year the president announces an annual presidential message which sets strategic goals for the strategic development of the country. Once in the long-term period of 12 years (what is equal to two presidential terms), the government, namely, department of strategic and territorial planning in the Ministry of Economic Development of the Russian Federation, other agencies and relevant structures in regional and municipal governments develop strategic documents. These documents base on the goals announced in messages and scenarios of long-lasting prognoses. The national level documents are approved by the president. Then the documents for implementation stage are developed. On the implementation level, the system implies formulation of state programs and plans of activities for executive bodies. Documents on implementation level connect strategic goals with the specific plan of activities, budget resources, and clarified time plan. Regions and municipalities as subnational levels of power perform similarly: their strategies reflect supreme national strategy and national and subnational prognoses.

Then, the Federal Law №-172 also established a centralized register of all strategic documents ever adopted in Russia (*State automatized information system Management or GAS Upravlenie*, later in the text – *GASU)*. However, the GASU does not provide an entire snapshot of strategic document corpus yet. As for the end of 2016, or one year since the GASU was launched, GASU reported 16 national level sectorial strategies (including conceptions and plans), 12 state programs, 16 sectorial (ministerial) strategies, and 9 plans of activities of federal executive bodies. Meanwhile as for September 12, 2016, the real corpus of strategic texts accounted 32 national level strategies including 5 strategies of federal regions (macro-regions of Russia which consists of several subjects of federation), 703 regional strategies, and 6900 municipal strategies (Klimenko et al. 2015). Officially there are at least 42 state programs adopted since 2010, at least 56 ministerial and sectorial strategies, and 14 concepts. The full picture of the existing corpus of strategic documents is expected in 2018 for the national level and 2019 for the regional and municipal levels.

What happens on the sub-federal levels of power? The Russian Federation consists of 7 federal districts, 85 regions, and about 24,000 municipalities. The corpus of strategic documents on regional and municipal levels is comprised of the equal elements and should reflect the content of the strategic documents on the national level. Before adoption of the Federal Law №-172, it was not mandatory, rather it was recommended to develop long-lasting strategies on the sub-federal level. However, the experience of regions and municipalities in formulation of long-lasting plans is vast. But these documents drastically vary by procedures of formulation and implementation, their content, even time horizons of planning, and titles.

In November 2016, 5 federal district strategies, 56 regional strategies of socioeconomic development, 54 regional state programs, 22 plans of activities, 20 long-term forecasts (till 2027 or 2030), and 93 midterm forecasts (till 2019) were reported by the regions to the register. Municipalities reported 553 strategies of socioeconomic development, 313 plans of activities on implementation of strategies, 26,300 municipal programs, and 207 long-term and 1635 midterm forecasts. With the requirements of the Federal Law №-172, all the corpus of sub-federal strategies of socioeconomic development should be updated to fit the requirements of the new legislation. Initially the law set a deadline to submit the version of the national long-lasting strategy of socioeconomic development and new sub-federal strategies till January 1, 2017. But the Federal Law №-210, dated June 23, 2016, set the new deadlines. Till January 1, 2018, the new national strategy of socioeconomic development should be submitted, and the strategies of sub-federal level should be brought into accordance with this document till January 1, 2019.

The current organizational scheme meets sound critics. First, the prescribed obligation for strategic documents of long-lasting planning to reflect annual presidential messages contradicts the philosophy of strategic view as such. Then, despite a big corpus of strategic documents, their normative power remains not enough clarified. A redundant variability in the kinds of documents, titles, and standards makes the organizational intention highly challenging. Third, the absence of sanctions for noncompliance of policies with strategic documents can be taken as an indicator of the weakness of strategic documents in the system of state decision-making. Fourth, in practice public policies are implemented through a parallel competing system of target programs and national priority projects, including the May Decrees-2012 themselves. Among all kinds of public documents, strategies of socioeconomic development remain declarative and not connected to financial resources. Finally, though strategic management system is vast, only implementation of the May Decrees-2012 is somehow audited. Although a big amount of strategic documents was adopted since 1995, so far the system of strategic management in Russia remains rather short-term oriented. As an outcome, strategic documents are prepared, but almost all of them remain unimplemented. An additional line of critic is addressed to the lack of methodological support which could help better synchronize unanimous strategic activities in numerous authorities at all levels. This lack disorients and demotivates public servants who are responsible for strategic management.

## Strategic Management as a Public Consensus on Strategic Goals

Contemporary theories of public management imply that efficiency of public services increases with its transparency to the public and involvement of various social actors into different stages of public administration. Contrary to this, in Russia, commitments to involve the public into strategic management reduced along the time. So far, from the possible ways to provide transparency of the strategic process and involvement, an obligation to publish drafts of strategic documents and get a public feedback is a maximum to what was achieved. However, public administrators did not have obligations to admit this feedback.

The Concept-2020, which remains officially in force, was formulated by majorly technocrats from the federal executive authorities (50% of

the participants) (Shubenkova 2014). Experts and, among them, academia had smaller representation (47% and 16% accordingly) (ibid.). Business actors, state enterprises, and NGO hardly participated in the Concept-2020 formulation. In 2011 the process of the strategy revision was much more representative and open. The expert community was granted with major control over the working groups (78% of the members, 44% of them from academia) (ibid.). State corporations and NGO officially participated, and, by share in representation, technocrats with business actors concluded the list. The May Decrees-2012 are nontransparent: they are formal presidential documents which were prepared by the presidential administration without institutionalized public involvement. The Commission for Monitoring Targeted Socioeconomic Development Achievement Indicators of Russia appeared in July 2012 to monitor implementation of the May Decrees-2012. Since appearance, the list of members was changed eight times: some members were included, other excluded, and titles were amended. As for May 2016, representatives of the federal or regional executive power comprised 91% of membership in the commission (ibid.). Among them, 89% of members were appointed at their post directly by the president (ibid.). Thus, actor analysis reveals that strategic management was initially shaped dependent on the president. In 2014 the Federal Law №-172 excluded public actors from the strategic management procedures: since then strategic texts can be published without any commitments to communicate with public stakeholders regarding this issue.

Summing up, normatively strategic management on the federal level in Russia remains institutionally and methodologically weak. By several iterations of regulatory changes, strategic management was established as a practice controlled by the president. Despite the well-studied claim that public involvement and accountability make political decisions more reflective to the public demands, and that reforms are more successful in more accountable government, in Russian strategic management, there are no commitments to consider public feedback or involve citizens in strategic goal setting. Formulation of the officially running Concept-2020 and the Commission for monitoring was headed by incumbents of the federal executive bodies, and technocrats, appointed directly by the president. Another running strategic document – the May Decrees-2012 – was formulated by the presidential administration. The strategic texts, written with the wide and diverse public involvement (the Strategy-2010 and the Strategy-2020), remain without a formal approval. By content, strategic texts are guided by presidential messages, which are formulated by technocrats of the presidential administration. Following the theory that while making political decisions actors are driven by their desire to conserve their control over resources and maximize their rents [Bueno de Mesquita] (De Mesquita and Smith 2009), Russian strategic management is studied in terms of imitative political institution. The observation that national strategies of long-term development did not connect with financing from the public budget gives an additional argument to this claim, questioning the capacity of strategic management in Russia to be an instrument of development.

## Conclusion and Policy Implications

Institutional description of Russian strategic management reveals three features. The strategic texts have weak policy enforcement; the texts do not oblige officials to shape policies in accordance with the strategic texts. Then, technocrats and incumbents of executive powers define the content of strategic documents, while other public stakeholders do not have an institutionalized access to this process. Monitoring of strategy implementation is also exclusive for the wide public. Finally, long-lasting goals and the content of strategic documents are defined by formal presidential decisions: annual presidential messages. Orientation of long-lasting strategic management on the annual presidential messages contradicts the notion of "strategic" in the managerial approach. Long-lasting focus stays under a risk to be revised by powerful actors of strategic management for their momentary political benefits and interests.

This institutional design was changing along the time, but principal features remained similar. Strategic management in Russia was under-institutionalized in the early 2000s and gradually concentrated political power over the strategic goal setting under the president's control, despite an implied interest of various social stakeholders in long-lasting agenda setting. The strategic management was formed within the vertical of power, with a comprehensive dependence from the president. The administrative system of Russia might have some persistence to strategic management, because of a long experience as a planned centralized economy as a successor of the Soviet Union. However, the political role of this procedure in the contemporary political regime in Russia remains under discussion.

Numerous organizational issues are more to solve. Managers of the process face challenge to design the procedures, provide methodological instructions to public servants, and legally guarantee its implication. Additional problems arise with necessity to synchronize all activities in timing and cycle length and provide interconnection of the documents, indicators, legal basis, inheritance, and succession. The further milestones are scheduled for 2018 and 2019. Strategic documents should be brought in accordance with the current legal framework, and the new strategy of Russia till 2035 is expected to arrive.

## Synonyms

Adjustment; Happy aging; Pension; Retirement plan

## Definitions

**Adaptation** signifies a change which requires effort, resources, and knowledge about what to do when you retire or stop working in a school and begin working in the informal setting.

**Benefit plans** are a type of retirement arrangements in which employers promise to provide its employees with a retirement benefit based on a formula that takes into account the employee's age at the time of retirement, years of service, and final average earnings.

**Retirement** is defined as a complete and definite withdrawal from the labor market by older workers at a defined age.

## Background to the Study

Exit from formal employment is problematic yet employees are paying little attention to it in regard to their lives after formal employment. This has raised concern among individuals, organizations, and policy makers on how best to retire. Retirement is part of a life cycle and has been part of industrial society for more than a century. It is a real and inevitable stage in work life though it has been avoided and neglected thus affecting employees thereafter. Changes in life expectancy, changing attitudes towards age old and tenure in the labor market are worth taking note of from the argument of strategic retirement. A number of employees in the labor market does not have a clear understanding of their role in achieving successful retirement yet in spite of its importance to them including both schools (as employers) and teachers (as employees). Teachers are aware of these challenges related to their aging though they pay less attention to action plans towards living well after formal employment (Armstrong-Stassen 2008).

People are living longer than ever before and the number of older employees in the workplace is growing. It is projected that between 2005 and 2050, the share of the population aged 60 which is the average age of retirement and above is projected to increase in nearly every country in the world. The life expectancy for people aged 65 has increased by about a third in Europe since 1970 and is still on the rise (Will et al. 2010). As people tend to live longer, this necessitates preparing for successful retirement yet approximately a third of retirees find a number of challenges during life after formal employment. These challenges range from lack of housing facilities, paying bills relating to rent to medication and food for selves, family, and other dependents. The entire change in lifestyle from formal employment to life without paid work is not easy. This transitional process presents with mixed feelings of people looking forward to another stage in life and having some anxiety about the new life. It particularly disturbs the aging with socio economic challenges of modern times as retirees struggle to leave happily especially with the absence regular income.

Retirement is not an abrupt transition from a working to a nonworking life. People tend to continue participating in the labor market in some form or another after retirement. At the same time, however, there are signs that people embark on retirement long before they reach retirement age. This means that the day they retire constitutes the end of a gradual process of a mental withdraw from the active labor force engagement that began many years earlier. In this respect, a number of teachers fail to plan for this day in successful retirement in Uganda. As individuals age, exit from formal work becomes inevitable because they cease to be productive. They thus stop getting monthly earnings (salaries and allowances) that in most cases come with fringe benefits such as rewards. The savings in the long run get depleted rendering their survival hard. Their respect, self-worthy, praises from supervisors and colleagues, influence, and social networks diminish rendering survival in the informal sector hard. With limited resources, settling in the community and adjusting to the new unsalaried routine becomes challenging.

## Retirement of Teachers in Uganda

Uganda's education system is structured in a hierarchical order of 7-4-2-3 and comprises of pre-primary school education of 7 years; secondary education covering 4 years of ordinary level secondary, and 2 years of advanced level secondary; teacher education and business, technical and vocational education and training of 2–3 years; and tertiary education including university education for 3–5 years (Lugya 2017). The 2016 Ugandan Annual School Census places the total number of teachers in both government-aided and private primary schools at 202,617 and those in secondary schools are 58,100, bringing the total number of teachers in the country to 260,717. Uganda has failed the hard-working teachers who give all their service of teaching as some of them retire to nothing, simply because government and the ministry of public service has

messed up their pension. The Public Service pension scheme is the main retirement benefit scheme in Uganda that was set up to benefit employees in public service inclusive of public teachers who upon retirement are supposed to receive gratuity and life pension. It is not always rosy as cases of delayed pension or no pension, embezzlement of pension funds has become a common song, rendering many old retirees desperate and vulnerable to the unforgiving economic turmoil. Currently, the Ministry of Public Service has an outstanding pension and gratuity liability of Ugx 199 Bn. The rate at which gratuity and pension arrears continue to accumulate uncontrollably will soon be unsustainable. Relatedly, the National Social Security Fund (NSSF) covers all employers who have 5 or more employees between 16 and 55 years of age, with the exception of employees under the Government Pensions scheme. The NSSF Act requires a registered employer is required to pay contributions to the Fund for his/her employees every month during which he/she pays salaries. This includes teachers in private secondary schools who contribute to NSSF, though NSSF is equally poorly managed. Much as a number of retired teachers in private schools have benefited from NSSF, the Uganda National Teachers Union expressed concern over nonpayment of around 800 secondary school teachers' benefits and gratuity in 2018 without official explanation in different districts and municipalities.

## Theoretical Perspectives

The lessons derived from the action of retirement of Ugandan teachers from schools in the context of public administration calls for theoretical review. According to Reay and Whetten (2011), a good theory is one that explains practice or behaviors. There are a number of theories that could explain the action of transition of teachers from schools into retirement; Continuity theory, Development theory, Work Adjustment theory, and Role theory. A multi theoretical approach is adopted to explain strategic retirement in Uganda due to the inherent limitations in each theory.

The continuity theory (Atchley 1989) states that older adults will usually maintain earlier activities, behaviors, personalities, and relationships as they did in their earlier years of life so as to maintain their psychological well-being. According to the continuity theory of aging, individuals do not really change as they age, but become more of what they have always been. This theory holds that in making adaptive choices, middle-aged and older adults attempt to preserve and maintain existing internal and external structures; and they prefer to accomplish this objective by using strategies tied to their past experiences of themselves and their social world. The strength of this theory is that there is a continuity pattern of the activities currently performed by retired teachers which are closely related to their earlier tasks and duties they executed while in schools. These include counseling, chairing different community task forces, guiding the locals on different investment opportunities, and heading religious committees. This theory emphasizes maintaining similar pattern of activities to copy well with life in retirement which is not the case with some teachers who go into different livelihood like money lending and even end up succeeding. This theory has a weakness of failing to consider that retired people receive substantial reductions in resources during retirement. Again, this theory does not consider the multi-dimensional life of older people which include race, culture, multiple roles, and life events. The theory has a weakness of not explaining how teachers are prepared to leave schools and take on new sets of tasks and duties outside teaching institutions. In major life transitions of retirement, it is not necessarily continuity of specific activities that is important but rather that individuals achieve continuity in preferred levels of voluntary engagement in socially and cognitively meaningful activities that they regard as important of which the theory is silent about. The gaps in continuity theory are partially addressed by the theory of the Development theory.

The Development theory (Erikson 1968) is a comprehensive psychoanalytic theory that identifies a series of eight stages in which a healthy developing individual should pass through from

infancy to late adulthood. All stages are present at birth but only begin to unfold according to both a natural scheme and one's ecological and cultural upbringing. In each stage, the person confronts and hopefully masters new challenges. Each stage builds upon the successful completion of earlier stages. The challenges of the stages not successfully completed may be expected to reappear as problems in the future. However, masterly of a stage is not required to advance to the next stage. The outcome of one stage is not permanent and can be modified by later experiences. Erikson's stage theory characterizes an individual advancing through the eight life stages as a function of negotiating his or her biological forces and sociocultural forces. Each stage is characterized by a psychosocial crisis of these two conflicting forces. If an individual does indeed successfully reconcile these forces (favoring the first mentioned attribute in the crisis), he or she emerges from the stage with the corresponding virtue. Related to teachers, they are continuously trained and developed which lead them into their career growth. However, this theory is silent on the identity of a person after retirement. The Work Adjustment Theory comes in to address this weakness.

The Theory of Work Adjustment describes the relationship of the individual to his or her work environment (Rene 1964). The work environment requires that certain tasks be performed and the individual brings skills to perform the tasks. In exchange, the individual requires compensation for work performance and certain preferred conditions, such as a safe and comfortable place to work. The environment and the individual must continue to meet each other's requirements for the interaction to be maintained. The theory is applicable to people experiencing adjustments in their careers as is the case of teachers who struggle to adjust to the new life of unemployment. The theory does not explain the focus on the fit between the person and his or her new local environment without regular salaries/resources.

During career transitions particularly exiting from work, individuals deal with disruptions that involve loss of resources such as skills, relationships, and identity. They are tempted to minimize these losses through the use of different strategies. Role theory (Ashforth 2001) provides an explanatory framework of retirement intentions based on past work experiences. Role theory focuses on the role identity during the role transition process. Role identity is presented as a set of goals, values, beliefs, norms, interaction styles, and time horizons. Thus, identification is encouraged when the role occupant defines him or herself entirely or partially in terms of the perceived role identity. As passing from work to retirement can be viewed as a role transition, workers who identify themselves with their professional roles tend to take later retirements. This greatly affects teachers as they exit from schools into local communities. Therefore, if work role identity is central to an individual's identity, this person should be inclined to pursue a professional activity once retired from his or her career job, preferably in the dominant focus of identification. Otherwise, the transition should be oriented toward the extraprofessional roles that are valued at the time of retirement (i.e., associative activities or volunteering).

## Conclusion

This entry concludes that people who are happy; prepare, plan, set aside resources and facilities to assist them in transition to retirement life. It shows that enjoyable work and setting goals enhances strategic retirement of teachers into local communities. As teachers find their routine work interesting, they are remunerated and earn which income is used for investment in different ventures that they depend on after formal employment. The researchers also highlight the importance of educating children and close dependents who later on tend to assist retired teachers. For example, by the time the individual is retiring from teaching; those they spent on by schooling them are beginning to work thus taking care of the retirees who worked harder in educating them.

This study identifies that setting goals promotes successful retirement. Setting goals incorporates economic, social, environmental, and cultural features that enable individuals to live a meaningful and satisfactory life after formal

school employment lives. The individual avoids stress as he or she transits into the local community with home people. All in all, if a teacher planned and constructed his house and has resources to keep him or her moving; the local community will with easy be supportive in his or her adjusting in the new society thus leading to strategic retirement.

Conclusively, this entry demonstrates the relevancy of individuals striving to skilling themselves in possessing different attributes that are needed in life after exiting from university work. This entry demonstrates the need to have informal abilities other than technical and professional competencies so as to adjust in the local community. When people possess skills to survive in the local community, they will easily succeed in life during retirement because they can easily cope with the new life without formal employment. It can therefore be concluded that retirees find life interesting when they have required talents to survive on during retirement. However, scholars note that it is challenging for a number of older employees to have the talents to assist them in their new life as they begin living in a new society from schools.

The research observes that adaptation significantly improves successful retirement. While the study notes negative effects of leaving formal employment especially the monthly salaries and allowances, adaptation is still vital for successful teacher retirement. This entry concludes that coping with the changing world, like accepting to forfeit some privileges like free meals, medical facilities, transport, and other social amenities that are associated with teaching leads to successful retirement.

# Strategic Trade Policymaking

Suwastika Naidu
School of Management and Public Administration, Faculty of Business and Economics, The University of the South Pacific, Suva, Fiji

## Synonyms

International trade; National Export Strategy; Trade theories

## Brief Definition

National Export Strategy outlines the actions undertaken by the national government to achieve sustainable growth by enhancing the competitiveness of the trade sector.

National trade policy refers to policies governing the buying and selling of goods, mainly from the international markets.

## Introduction

Most people would agree that international trade is beneficial to the world economy. There are groups of individuals who argue that international trade has adverse implications on the world economy. Over the last century, numerous theories have been developed to examine why countries engage in international trade and the implications of international trade on the world economy (Krugman et al. 2020). The traditional trade theories assume that markets are perfectly competitive, with constant returns to scale and homogenous goods. The new international trade theory has challenged these assumptions (Krugman et al. 2020). This essay aims to discuss the new theory of international trade and its implications for designing and implementing trade policy in Fiji and Samoa.

## New Theory of International Trade

To begin with, the new theory of international trade assumes that markets are characterized by imperfect competition, increasing returns to scale, and product differentiation (Gounder 2020). The theory of imperfect competition acts as the primary basis for explaining the dynamics of the market structures moderating the exchange of goods and services in the modern economy (Krugman et al. 2020). In contrast to the arguments of the traditional trade theories, the new theory of international trade emphasizes that perfect competition is not likely to exist in the modern markets as aggressive competition would drive down prices of goods to marginal cost.

Unfortunately, firms that are not able to recover their losses are pushed out of the market. Eventually, this process will continue until the market reaches an imperfectly competitive equilibrium. Fiji's pharmaceutical sector is a critical case that can explain how powerful big players in the market are driving out small players to cut competition from the market. According to Kumar (2020), most of the pharmacies in Fiji are owned by two powerful businesses, and these powerful players are driving out competition from the pharmaceutical market. This new article also emphasizes that pharmacies are not adhering to the Pharmacy Profession Act. The Fiji Pharmaceutical Society President, Reenal Chand, emphasized that a non-competitive pharmaceutical market in Fiji will have adverse implications on consumer sovereignty and freedom of choice. The Pharmacy Profession Act 2011 specifies that a registered pharmacist should not own more than two separate pharmacies in Fiji to protect consumers. Individuals who do not comply with the Pharmacy Profession Act of 2011 will be convicted with a maximum penalty of $20,000 (Kumar 2020). One of the advantages of the new trade theories is that it incorporates two additional characteristics of the firms present in the real world. These assumptions are (1) product differentiation in most sectors and (2) variability in performance measures across firms. Fiji produces a range of products ranging from cosmetics, bottled water, clothing, gems, and beverages. The product differentiation level that may exist across these product ranges can be low to very high (Krugman et al. 2020).

Furthermore, the new theory of international trade offers several reasons that explain why government intervention may be beneficial for the economy. The modern world is characterized by second-grade optimum, which explains the reasons for government intervention to correct poor market results. According to Burnete (2007), free trade benefits should not be generalized as government intervention is necessary to correct the distortions that may arise from free trade.

## Strategic Trade Policy of Fiji and Samoa

Furthermore, the Ministry of Industry, Trade, and Tourism (MIIT) is primarily responsible for the formulation and implementation of Fiji's strategic trade policy. Importantly, the MIIT consults government and nongovernment agencies to formulate and implement Fiji's strategic trade policy (World Trade Organisation 2016). Holistically, there are many trade policy strategies that are simultaneously implemented to protect domestic

producers and enhance the international competitiveness of Fiji's export sector. To ensure that there is no duplication of the strategic trade policy efforts, the MIIT has to consult all the respective ministries to formulate strategic trade policies that create value for all sectors. Currently, two main strategic trade policy documents act as the guideline for the implementation of the trade policy instruments. These are the Fijian Trade Policy Framework (FTPF) and National Export Strategy (NES) (World Trade Organisation 2016).

Similarly, the Ministry of Foreign Affairs and Trade (MFAT) of Samoa is responsible for developing strategic trade policies. Currently, the responsibility for trade negotiations has been delegated to the Ministry of Commerce, Industry, and Labour (MCIL), with the National Working Committee (NWC) of Samoa meeting four times per year to discuss the trade arrangements. Two main policy documents guide the strategic trade policies of Samoa, and these are the Strategy for the Development of Samoa (SDS) and Trade, Commerce and Manufacturing Sector Plan (TCMSP) (World Trade Organisation 2019).

### National Export Strategy (NES) of Fiji and Strategy for the Development of Samoa (SDS)

Moreover, the NES of Fiji focuses on the diversification of Fiji's export sector in six priority areas, namely, (1) mineral water, (2) agro-business, (3) forestry, (4) audiovisual, (5) information computer technology, and (6) fisheries. It provides financial support to the exporters to procure value-adding machinery and equipment. The MIIT has clearly outlined that proposals from the exporters wishing to diversify their business in the six priority areas will be evaluated and accepted for funding (Ministry of Industry and Trade 2014). Table 1 shows that the total value of projects approved under the NES was FJ$2.2 million in 2015, FJ$1.075 million in 2016, and FJ$1.6 million in 2017.

**Strategic Trade Policymaking, Table 1** Value of projects approved under NES

| Year | Value ($) |
|---|---|
| 2017 | 1,600,000 |
| 2016 | 1,075,118 |
| 2015 | 2,200,000 |

Source: Ministry of Industry, Trade, and Tourism (2015a, b, c, 2016, 2017)

Similarly, the SDS for Samoa covers several priority areas, and increasing Samoan exports is one of the key outcomes of priority areas on economic development. The Samoa government recognizes that foreign trade provides income-generating opportunities for the locals. It is a way of providing long-term sustainability to local livelihoods. There are many schemes and programs developed by the Samoan government to support the local businesses. These are the Samoan Agriculture Competitive Enhancement Program and Samoan Agribusiness Programs (Government of Samoa 2016).

### Fijian Trade Policy Framework (FTPF) and Samoan Trade, Commerce, and Manufacturing Sector Plan (STCMSP)

Furthermore, the FTPF was launched in July 2015 to enhance Fiji's trade performance by aligning the trade policy to ten guiding principles. These guiding principles are (1) generation of employment opportunities, (2) adherence to national policies, (3) a proactive approach to economic development, (4) enhancing the standard of living for Fijians, (5) creating a conducive environment for private sector performance, (6) export diversification, (7) achieving a sound balance of payment position, (8) promoting international competitiveness of the export sector, (9) strengthening human capital and technical skills, and (10) environmental protection. Precisely, the trade policy instruments form an integral part of FTPF, and these instruments are antidumping, safeguards, countervailing measures, tariffs, export taxes, import permits, and duty suspension scheme (Ministry of Industry, Trade, and Tourism 2015a, b, c).

Similarly, the Samoan Trade, Commerce, and Manufacturing Sector Plan (STCMSP) plays a critical role in driving Samoa's trade reforms. Initially, the STCMSP 2012–2016 provided various strategies undertaken by the Samoan government to diversify the production base. The contemporary STCMSP 2017–2021 provides strategies for improving Samoa's export performance by facilitating private and public

partnerships. It specifically emphasizes reducing tariffs and the implementation of special economic zones (SEZs) to increase labor productivity and strengthen Samoa's export sector.

## Opportunities of the New Theory of International Trade on Strategic Trade Policy

Undoubtedly, the Pacific Island countries are members of the small, vulnerable economies (SVE) groups, whereby trade remains an important component of achieving sustainable economic growth. Fiji and Samoa's strategic trade policy documents have emphasized the numerous opportunities that trade offers to domestic firms.

First, the strategic trade policy aims at supporting the most efficient branches of the economy. The new theory of international trade postulates that the benefits from free trade should not be generalized as there can be possibilities of distortions resulting from free trade (Krugman 1987; Maha et al. 2012). The government can quickly intervene by using strategic trade policy instruments and policies to address these distortions. Undoubtedly, this provides numerous opportunities for trade policy formulation and implementation (Krugman 1987; Maha et al. 2012). The NES and SDS of Fiji and Samoa focus on key priority areas that act as the backbone of Fiji's and Samoa's economy. As Fiji and Samoa's firms engage in international trade, their interaction with customers and suppliers from the international markets helps them learn and enhance their key capabilities and competencies in production. The governments of these countries can intervene with trade policy instruments to protect local companies and promote trade (Krugman 1987). Consequently, this increases the total factor productivity needed to help Fiji and Samoa realize their growth aspirations. Table 2 shows that the number of project proposals approved decreased from 19 in 2015 to 11 in 2011. Government assistance under the NES is provided only for mineral water, fisheries products, agro-business, and forestry.

**Strategic Trade Policymaking, Table 2** National export strategy grant requests and project approvals

| Year | Number of companies requested grants | Number of proposals approved |
|---|---|---|
| 2017 | 26 | 11 |
| 2016 | N/A | 11 |
| 2015 | 53 | 19 |

Source: Ministry of Industry, Trade, and Tourism (2015a, b, c, 2016, 2017)

Second, the new international trade theory is based on the assumption of product differentiation, which explains how firms gain competitive advantage by changing the product's tangible and intangible attributes to make the products look superior compared to the competing products (Krugman 1987; Maha et al. 2012). This assumption of the new theory of international trade helps the policymakers identify the specific priority areas that Fiji and Samoa should focus on to help domestic firms differentiate their products and improve efficiency and competitiveness in the international markets. The NES of Fiji focused on sustainable development of Fiji's export sector by encouraging value addition and diversification in six product sectors (garments, mineral water, agro-business, forestry, marine products, and sugar) and seven service sectors (education and training, labor mobility, tourism, information computer technology, health services, financial services, and audiovisual). These are the sectors with a high potential for value-adding and improving the product and service quality via differentiation. Figure 1 shows Fiji's government grants to the National Export Strategy over the last 5 years maximized for the budget period 2018–2019 but significantly decreased for the budget period 2019–2020.

Similarly, the government of Samoa has implemented the Samoan Agriculture Competitiveness Enhancement Project to support 18,000 rural households by increasing the production of agricultural products to diversify the export base of Samoa (The World Bank 2012). This project is part of SDS to reduce Samoa's vulnerability to the oil price and global food shocks. This project's three essential components are livestock production and

**Strategic Trade Policymaking, Fig. 1** Grants by the government of Fiji to the National Export Strategy. Source: Government of Fiji (2015, 2016a, b, 2019)

marketing, fruit and vegetable production, marketing, and institutional strengthening. This project is financed by an IDA Specific Investment Credit of US$8million and an additional US$5million by the World Bank (The World Bank 2012). The project's main focus under the SDS is to differentiate Samoan-grown agriculture products via high-quality value-adding.

Third, the new theory of international trade assumes that markets are imperfectly competitive, and firms' pricing policies are interdependent, whereby firms consider the responses from consumers and competitors before designing competitive strategies (Krugman 1987; Maha et al. 2012). This assumption of the new theory of international trade facilitates the design and implementation of strategic trade policy. It helps the policymakers use trade policy instruments to make the domestic exports more competitive in the international markets. The governments of Fiji have been supporting agriculture exports by providing subsidies for the production of agriculture commodities. Specifically, Fiji's government has been providing subsidies to the sugarcane farmers for fertilizers and weedicides. Figure 2 shows that Fiji's government has been consistently providing fertilizer subsidies to the sugarcane farmers, but weedicide subsidies have significantly declined from the year 2018 to 2020.

In comparison with Fiji, Samoa is far behind in providing export support and promotion activities to boost the trade sector's competitiveness. At the moment, Samoa is preparing the Export Development Scheme, which aims to develop high-quality value-added products for exports. This scheme also intends to offer credit guarantees to local exporters. Samoa's agriculture exports are substantially liberalized with no export subsidy support to the domestic farmers.

In addition, Fiji provides several export assistance and promotion schemes to boost the competitiveness of the export sector. The Short-Term Export Profit Deduction Scheme exempts income tax from the exported goods and services' net share. Exporters from Fiji have benefitted extensively from Export Finance Facility (EFF), Import Substitution Facility (ESF), Duty Suspension Scheme (DSS), and Tax-Free Region Incentives (World Trade Organization 2016).

## Challenges of the New Theory of International Trade on Strategic Trade Policy

The PICs are small island economies that are constrained by its population, landmass, availability of natural resources, and international trade

**Strategic Trade Policymaking, Fig. 2** Fertilizer and weedicide subsidies provided to sugarcane farmers. Source: Government of Fiji (2018, 2019, 2020)

share. These countries face unique socioeconomic and environmental vulnerabilities that are not faced by large developed and developing countries. Fiji and Samoa are not an exception to this (World Customs Organization 2020). Specifically, some of the constraints that inhibit Fiji's and Samoa's export capabilities are high communication costs, poor institutional environment, vulnerability to natural disasters, remoteness, and lack of connectedness to the global supply chains (Gounder and Prasad 2011). As a result of this, Fiji and Samoa are heavily reliant on imports, and their domestic markets are too small to provide significant economies of scale (World Customs Organization 2020).

Furthermore, there are numerous challenges that the new theory of international trade imposes on strategic trade policy formulation and implementation of Fiji and Samoa. First, increasing returns to scale cannot be achieved by exports from Fiji and Samoa as it is difficult for domestic exports to compete with high-quality exports from influential players in the global market. This imposes a major challenge for the trade policy formulation and implementation as export support schemes and programs may not boost the local exports' quality to a level that may enable local products to achieve economies of scale (Bureau of Statistics 2020). Figure 3 shows that Fiji's major exports are mineral water, gold, garments, and sugar. The exports of mineral water have been consistently increasing from the year 2015 to 2019, but the exports of gold, sugar, and garments are declining (Bureau of Statistics 2020). Fiji Water is the world's premium water. Fiji Water Bottling company can easily maximize its share of the international market. However, poor infrastructure quality and technical expertise inhibit Fiji Water from economies of scale.

Similarly, the major export items of Samoa are cocoa, kava, copra, beef, timber, copra, and coconut oil. However, it would be difficult for Samoa to achieve economies of scale in these product categories as it cannot compete with Indonesia, India, China, Australia, New Zealand, Brazil, and the United States in the export market of these commodities (Common Wealth Network 2020).

Second, the presence of imperfect competition imposes data challenges and empirical difficulties to formulate and implement strategic trade policies. Trade policymakers and economists do not have trustful models, and these models are subject to criticisms (Krugman 1987; Maha et al. 2012). In reality, firms in the imperfect competitive markets make decisions whereby their goals and objectives may be hidden from the policymakers. This lack of information on firms' behavior imposes major challenges on the design and

**Strategic Trade Policymaking, Fig. 3** Major exports of Fiji. Source: Bureau of Statistics (2020)

implementation of sustainable trade policies. For example, Fiji's government is prioritizing the export growth of specific sectors by financing tangible and intangible assets that are used directly for export purposes. The Export Credit Facility is only provided to businesses in key priority areas, such as mineral water, marine, forestry, agribusiness, audiovisual, and information computer technology (FDB 2020). These projects are approved based on a criterion that excludes the financing of traditional exports of molasses, green logs, sawn timber, and sugar. The assessment committee approves funding based on the information provided by businesses on their company. These companies may have ancillary goals that do not fit the criteria of the Export Credit Facility financing. However, their projects may be approved as these ancillary goals are not to be disclosed to the assessment committee members (Krugman 1987; Maha et al. 2012). Winners are producers in the key priority areas, and losers are producers outside the key priority areas.

Third, trade policymaking and implementation can lead to retaliation risk and commercial wars, and government intervention can be hijacked by certain interests. For instance, the imposition of tariffs, import permits, antidumping measures, and safeguard measures by the Fiji government can lead to retaliation from countries affected by this trade policy (Ministry of Industry, Trade, and Tourism 2015a, b, c).

Fourth, the government budget for the small island economies is limited and is subject to significant constraints that inhibit their ability to support all the sectors in the economy (Krugman 1987; Maha et al. 2012). It is difficult for small island economies to protect all its sectors by using interventionist policies. Any government intervention will lead to misallocation of resources, and these interventions are usually harmful. Limited financial budget imposes major challenges in designing and implementing trade policies. For example, the Samoan Agriculture Competitiveness Enhancement Project has limited funding to support only 18,000 households. The marine and fisheries products have greater export potential, but a high level of disparity is noticed in the Samoan government's funding for the fisheries and agriculture sector. The winners are households supported by the Samoan Agriculture Competitiveness Enhancement Project, and losers are the households who did not get an opportunity to be part of this project. This shows the existence of welfare disparities within and across different industries within the same economy (Krugman 1987; Maha et al. 2012).

## Conclusion

To conclude, the new theory of international trade has challenged the traditional role of the government. Most adherents of the new theory of international trade consider that the government should support those industries that have positive externalities and change the profits between national and foreign companies (Krugman 1987; Krugman et al. 2020). Undeniably, the

government's role is significant in boosting the competitiveness of the small island economies as these economies face numerous resource challenges that are not faced by large developed and developing countries. Therefore, the government's role in the small island economies is to intervene by using the strategic trade policies to transform Fiji and Samoa into an internationally competitive export-led growth-oriented economy. Fiji government is using antidumping measures, safeguards, countervailing measures, tariffs, export taxes, import permits, and duty suspension scheme as trade policy instruments, while Samoa is focusing on reducing trade barriers and liberalizing trade. Using the strategic trade policy tools to provide a competitive advantage to the domestic companies is a challenging task as empirical difficulties and lack of data availability imply that the use of the strategic trade policy tools will not achieve the desired results.

# Strategically Agile Government

Yves Doz[1], Mikko Kosonen[2] and Petri Virtanen[2]
[1]INSEAD, INSEAD Europe Office, Fontainebleau Cedex, France
[2]The Finnish Innovation Fund Sitra, Helsinki, Finland

## Synonyms

Adaptive public policy and public organizations; Strategic insight

## Definitions

Strategic agility consists of adaptive strategic sensitivity, resource fluidity, and collective leadership commitment.

## Introduction

This conceptual paper aims to set out a new framework for public sector governance and leadership in order to help decision-makers to cope with increasing complexity and volatility. The difference between linear and complex way of policy-making is profound – it relates to the nature of policy-making, context of policy-making, and initial conditions that affect the policy process. Because of the increasing complexity of our societies, a recent OECD Public Governance Committee Report (OECD 2017) advocated the view that governments should find new systemic solutions to complex – or wicked – societal challenges to build more resilient and adaptive government and public administration structures that incorporate, rather than filter out, complexity. This paper aspires to provide a framework and some practical insights on how this could be done.

As for the background, it has been over quarter of the century since the publication of Hood's (1991) seminal work on the concept of New Public Management (later on referred as NPM). Pollitt (2007) sums up the development of New Public Management by arguing that the landscape of public sector organizations and organizational processes remained differentiated after the deployment of this doctrine: there was no substantive convergence among those national governments that advocated the doctrine simply because they, and the management systems they used, remained so different. This is due to the fact that public administrations vary a lot in terms of their political, economic, and organizational cultures. As a consequence, it was not very surprising that the NPM doctrine in fact encompassed a relatively brief and transitory phase before the emergence of the embryonic plural and pluralist tradition of the New Public Governance (later on referred as NPG) doctrine (Osborne 2006). NPG brought into the "management picture" the role of policy networks and decision-making based on organizational networks.

There are certain "hardy perennials" of contemporary public policy and public management literature. These "hardy perennials" include conceptual entities such as bureaucracy, network, decentralization, power, governance, and, we would like to add, strategy. Somewhat surprisingly, the last one of these, strategy has been an

unassailable concept in the management and public policy sciences for decades. This paper intends to fill this gap, and it builds upon the concept of public sector strategy and strategic agility in particular.

Over the last few years, strategic agility has gained popularity in management sciences and in academic public policy discourse because of its ability to link up with other theoretical concepts (e.g., Rosenberg Hansen and Botcher Jacobsen 2016). Moreover, it is somewhat surprising that the role of strategy and strategic insight has remained a rather unexamined research aspect within the plethora of recent public sector reform literature. Public sector reforms are typically hybrid, complex, and inconsistent, and they address usually permanent tensions between certain key elements in public policy – that of juxtaposition between centralization and decentralization, between coordination and specialization, between integration and fragmentation, and among efficiency, fairness, and resilience goals – but neglect the role of strategy aspects.

This paper proposes a new governance framework (and New Public Management doctrine) for public policy and public administration, based on the concept of strategic agility. Strategic agility refers to the ability to exploit or create to one's advantage changing patterns of resource deployment in a thoughtful and purposeful but also fast and nimble way rather than remain hostage to stable preset plans and existing action models (e.g., Doz and Kosonen 2014). The concept of strategic agility stems from research concerning the experience of large mature business corporations that have navigated major disruptions and systemic transformations (Doz and Kosonen 2008; Doz and Wilson 2018). Although relatively new, the strategic agility framework has been adopted and used successfully by the OECD in its country governance assessment work (OECD 2011) and further applied in empirical academic research on governments (e.g., Doz and De Clara 2013) and public policy (Virtanen and Stenvall 2018).

Over the years, there has been discussion going on about the specificity of public sector leadership vis-á-vis leadership in private sector. This paper builds upon the idea that the differences between private and public organizations are relative instead of absolute. This view holds that the specifics of a public organizations exist – e.g., the role of multiple organizational objectives as well as the fragmented focus with regard to accountability (e.g., Van Wart 2013) – but there are no absolute limitations or barriers for leadership competence transfer from private sector to public administration and vice versa.

This paper approaches strategic agility of an organization (public or private) from the interplay of three capabilities: strategic sensitivity (i.e., the capability for superior foresight and insight and for real-time strategic sensemaking), resource fluidity (i.e., the capability to reallocate resources to new opportunities and emerging challenges in a timely fashion), and collective commitment (i.e., the capability to make and implement decisions that mobilize multiple subunits toward sustained integrated action). The aim of the paper is to explore how the concept of strategic agility fits in within the domain of government, public policies, and administration. The paper builds upon the belief that there is a need for such a more holistic framework to help governments and public sector organizations to cope with increasing complexity and volatility in an integrated way. Strategic agility constitutes an important theoretical trajectory in the emerging public sector management ideology (e.g., Virtanen and Stenvall 2018).

This paper is organized as follows: firstly, it focuses on at the evolution of public sector management doctrines. Secondly, various types of rigidities that prevent proactive systemic and organizational changes in public policies and organizations are analyzed. Thirdly, the paper describes how strategic sensitivity, resource fluidity, and collective commitment function in the domain of public governance. Finally, the paper sets out the future research agenda with regard to strategic agility in government and public administration.

## The Complex World of Public Policies

The strategic as well as operational reality of the public sector has changed radically. Governments

and their public administrations face globally fundamental and pervasive transformation challenges to their policy-making and policy delivery. Public organizations will also be profoundly affected by this transformation. In this section we ask, what causes this transformation?

First, the world itself has changed. Demographics, technological revolutions, and geographic shifts make existing public policies unsustainable and call for more effective approaches. Nation states, their governments, and public policy delivery mechanisms need to respond to these challenges. Second, the vulnerability of the financial system and the high cost of its rescue, compounded and accelerated the structural adjustment crisis demographics, technology and globalization are driving, leading to unsustainable levels of public spending and borrowing. The need to reduce public expenditures now forces governments to rethink the value of their role and activities from a more strategic and more selective perspective.

Third, established public policies are meeting their limits: despite sustained efforts, and some measure of success, they are showing themselves unable to solve long-standing (so-called wicked) challenges stemming from complex and unpredictable cause and effect relationships unfolding over time such as juvenile delinquency and long-term unemployment and to address emerging challenges, such as health-care costs, service ecosystem planning, retirement benefits and longevity, or the difficult lifestyle changes global warming calls for. These problems are characterized by symptoms being felt in one domain of government action, true causes being found elsewhere, and potential solutions deployed in yet other domains. Committing more resources to address them in a "siloed" manner no longer leads to improvements. Their systemic nature calls for new conceptual understanding about human well-being (e.g., Hämäläinen and Michaelson 2014) and systemic public policy solutions in public service delivery (Doz and Kosonen 2010; Middleton 2010), i.e., well-integrated and coordinated actions in multiple policy domains, deployed in an adaptive fashion over long periods of time.

Fourth, in major OECD countries, past choices further exacerbate the need for better integration and unity of government actions. In the 1990s decentralized specialized "agency" models came to prevail, within the public sector management paradigm often referred to as the NPM, to provide focus, efficiency, and accountability to policy implementation. These agency models, often based on decentralization, fitted well to situations where policy areas were independent, and measures taken in one area had no impact on others. For systemic problems and even more so for "wicked" challenges which cannot effectively be decomposed into separate simple problems, they are clearly inadequate.

Fifth, in the spirit of enhancing democracy, a new policy formulation and implementation model came to be widely advocated. According to that model, which often was labeled as the NPG, policy formulation was the purview of the political process, whereas the implementation and policy delivery was still at the domain of the administrative process. However, when confronted with challenges from strategic states which take a much longer-term perspective, such as Singapore or China, and where the policy and governance processes are closely integrated, the shortcomings of that formulation/implementation dichotomy and the limits of the political process in making wise strategic commitments became painfully obvious. Historically, political strategies were motivated by ideologies, but the confrontation with reality has eroded and exhausted ideologies in favor of greater pragmatism.

Furthermore, modern information technologies make society more transparent and interactive, which challenges not only policy-making but also policy delivery mechanisms, highlighting, for instance, the role of various service co-creation models in public administration. Constant (social) media attention makes politics and policy planning alike even more shortsighted and fragmented than electoral calendars. This has called for faster and more intelligent policy-making. "Wicked" policy challenges demand long-term sustained integrated attention across a range of departments and agencies and patient commitment to coherent actions across these.

This takes much longer than the duration of a government, or even of a senior civil servant's tenure, not to mention the attention span of public opinion driven by media hype, social networks, and opinion polls.

## Strategic and Organizational Rigidities in Public Sector

In a research for incumbent companies (Doz and Kosonen 2008), and later in applying these research findings to public sector context (Doz and Kosonen 2014), three sources of organizational rigidity were pinpointed – strategic atrophy, resource imprisonment, and diverging commitments. All of these are critical impediments. In the absence of strategic awareness, sensitivity, and understanding, governments will keep acting inertly on a "default" course of more of the same. Resource imprisonment prevents the timely dynamic reallocation of resources to new demands and challenges and perpetuates legacy budgeting. Diverging commitments among politicians and civil servants render consistent and committed collective action impossible. These rigidities are discussed in the following:

**Strategic atrophy**. In stable conditions, continuous positive feedback from ongoing activities reinforces established assumptions, perceptions, behaviors, and values. These aspects filter the issues decision-makers perceive and constrain collective learning and policy-making processes by emphasizing confirmatory evidence and discounting challenging evidence. This leads to tunnel vision, the gradual narrowing of decision-makers' attention frames, with the range of alternative solutions considered restricted to the ones already practiced. A clear division of labor and lack of horizontal cooperation among public sector organizations further breed tunnel vision, each unit's attention being focused narrowly on its domain.

Second, both individuals and organizations suffer from shortsightedness. Public sector organizations must accommodate the rapidly evolving interests of their politically elected leaders. These interests rarely extend beyond the next elections or even the next opinion poll. Moreover, annual budgeting processes make major long-term commitments and investments difficult for policy-makers and provide no incentives for longer-term performance in providing better and more affordable services to the population.

Yet, public sector leaders seldom get rapid feedback from their decisions, and the results of public policies are often hard to assess, particularly when dealing with complex challenges given the limits of evidence-based policies. Achieving strategic sensitivity would require continuous policy analysis; strong foresight capabilities, evaluation, and learning; as well as a strong shared knowledge base (Fuerth and Faber 2012). Hardly any government has the necessary capacity for this at the strategic policy-making level. International praise for success in competitiveness, education, and well-being rankings are a poor proxy when consequences of policy choices are not well understood. Moreover, they may breed complacency and a dominance mind-set.

**Resource imprisonment**. A second group of factors causing rigidity restricts the mobility of resources between alternative uses. Decisions that would require resource reallocations become hard to make. Individual departments, and their leaders, hold tightly to their "established" resources in the budgeting process. Conventional "legacy" planning and budgeting as well as existing laws and regulations for fund appropriation may leave little flexibility for resource reallocation among different policy priorities. Highly specialized and tightly integrated service delivery systems may also become a constraint to resource fluidity: they do not support new types of activities nor benefit from the sharing of expertise and resources among different organizational units. Existing rules and regulations, union-driven work practices, specialized investments and equipment, and established management practices all get in the way. Efficiency and agility work at cross-purpose.

The infrastructure and processes of collaboration and flexibility such as common data and shared information and IT systems as well as job rotation and training are also either completely lacking or insufficient in many administrations,

and the processes for collaboration may be non-existent, making the development of trust and commitment to joint action fragile and tentative. Long-lasting relationships with various stakeholders may further reduce the flexibility of resource allocation processes. Social ties and alignment with specific interest groups tend to bind decision-makers. New areas with new relationships tend to receive less attention and resources than established areas with strong and familiar relationships.

New strategic directions may be inhibited by competence gaps with insufficient talent to support the new activities. New strategies tend to require new types of competences that may not be easily available and do take a long time to develop. The practice of NPM may have led senior civil servants to hone the very kind of skills that will hamper rather than help the implementation of more integrative policies. Competence gaps lead to a mismatch between the strategic goals of the organization and their feasibility.

In established bureaucratic government organizations, the day-to-day performance of separate ministries, departments, and agencies may lead their managers to slowly develop differences and divergences that make taking decisions toward new strategic directions difficult. Strategic analysis, when conducted separately in each ministry, may result in even stronger divergence. Creeping deviations in understanding and priorities over time are reinforced by separate partial strategic analysis in each ministry.

**Diverging commitments**. Stable environments and clear role delineations for ministries departments and agencies strengthen the established interests who would lose most from structural change and reinforce existing perceptions and interpretations. In addition, past success and stability deepen social bonds and networks, which become constraints to change (Seo and Douglas Creed 2002). Fear of social opprobrium may deter civil servants from risking to "rock the boat" with radical ideas or initiatives. The growing size and specialization of public sector organizations and the move toward focused decentralization tend to separate their managers from each other as their own organizational units demand more attention and personal incentives and ambitions focus their attention to subunit goals. Over time, they may perpetuate their own specific belief systems, ideologies, preferences, and educational backgrounds. Yet, addressing wicked challenges requires collaboration and commitment from all the key stakeholders. Such commitment is difficult to achieve if the leaders of relevant public sector organizations are too divergent, attached to their own political power, defending their budgets, reliant on their own expertise, or emotionally disengaged.

Furthermore hubris sometimes drives harmful organizational turf battles, in particular, when an overall scarcity of resources turns resource allocation into a zero-sum game or an organizational "truce" between competing claims (March and Olsen 1976). Inflated egos may also surround themselves with people who have similar values and backgrounds and become sycophants, decreasing the quality of dialogue. When strong specialized leaders each with a proven track record in his/her field constitute the leadership team, there may be too little dialogue and critical thinking among them, in particular, if they respect each other's expertise and organizational turf too much and avoid to engage each other. Such expert managers may not develop a shared agenda integrating their respective policies. Expertise-based separate career tracks and promotion criteria amplify this problem.

Country governance is also subject to increasing media and public scrutiny, calling for clearer and more visible legitimacy of decisions. A more innovative use of resources is more difficult to justify, to measure, and to assess under the media limelight, leading to a higher perception of risk – as compared to "more of the same" on the part of policy-makers. Their career, performance measurement, and incentives may have made them particularly risk-averse and sensitive to a narrow interpretation of laws and regulations. And making a visible error for the first time would bring higher personal costs than being right one more time brings benefits, thus encouraging inaction.

Differences among policy domains' stakeholders also make policy integration difficult.

Policy-making processes may differ. For example, environmental and sustainable development policies are usually shaped by international agreements, whereas innovation policies are usually national. Policy tools vary among policy domains. Subsidies are commonly used in innovation and industrial policy, whereas environmental policies often rely on fiscal incentives and regulation. Time frames across policy domains also differ. For instance, environmental policies have very long lead times, whereas cyber security policies have to be evaluated frequently due to fast technology evolution. Staffing may also differ, between domains where highly specialized competences are at a premium and domains where more generalist skills may be key. Last, the resources available to different public sector organizations (and other stakeholders) differ and may hamper joint actions: some have excess resources, others face tight constraints, and all cannot contribute equally. Finally, emotional apathy and complacency may become sources of rigidity when one takes pride in past success. It is hard to move away from a winning streak and start anew. This risk grows when future opportunities look less thrilling and more risky than past experiences.

In sum, a government's capacity to handle new challenges is seriously constrained by these three sources of rigidity: strategic atrophy, resource imprisonment, and leadership divergence. In the next three sections, we review how to overcome the resulting rigidity, along the dimensions of strategic sensitivity, resource fluidity, and collective commitment.

## Fostering Strategic Sensitivity

Strategic sensitivity requires early perception and recognition of emerging trends, a combination of foresight and insight, high-quality dialogue with internal and external key stakeholders, and an ability to frame strategic issues in a fresh and insightful way. Key factors that support strategic sensitivity are increased discrepancies between heightened ambition and the likely outcomes of current policies, sufficient cognitive diversity in inputs, and intensive communications.

**Heightened ambition**. Strategic sensitivity requires an ability to overcome complacency and routinized ways of thinking and acting (Schön 1973). Crises, or the mere reframing of performance against higher ambitions, often introduce contradictions that create a discrepancy in the minds of decision-makers between what is needed and what is achieved. The discrepancy encourages individuals and organizations to reflect on their current sensemaking and behavioral patterns and reframe their current situation and operating environment.

Ambition discrepancies can also be nourished by strategic intelligence activities – such as foresight work, strategic analysis research, scenario planning, evaluation, and benchmarking that identify and highlight the future inadequacy of current policies. The discrepancy between the current and the ideal or expected future state creates a cognitive contradiction that fosters new strategic insights. The strategic policy intelligence activities can be organized with various constellations of public, private, and third sector organizations, research institutions, and civil society stakeholders, in a spirit of inclusion and diversity.

Crises are not the only sources of discrepancies that prepare minds for new insights. Leaders of an administration can create dissonance that motivates reframing. First, they can use stretch goals to make a gap between actual achievements and heightened ambitions more visible and question the effectiveness of prevailing practices and behaviors. Such ambition can be reinforced by public announcements where the political leaders commit themselves and their government to major change and build a wider coalition for change. Second, beyond stretch goals, contradictory goals with multiple objectives that pull in different directions encourage civil servants to search for new creative solutions that go beyond routine responses, to think about and take into account multiple perspectives and priorities, and to transcend routinely accepted trade-offs.

Cognitive reframing can also be catalyzed through defining the core activities and goals of the organization more broadly and openly than just describing what it does today, in a more future-oriented strategic perspective with an

emphasis on the needs it serves and the functions it fulfills. Doing so may also encourage a more open and insightful dialogue, and a wider more creative framing, focused on future needs and functions, allowing new courses of action to be identified.

Experimental activities contained at a local or subunit level can also enact new realities with limited risks (Sabel and Zeitlin 2012). Small-scale pilot projects or simulations provide low-risk opportunities for testing alternatives to the established operating models and mechanisms. If an experiment or simulation works in a better way than the established approach, the resulting contradiction can spark a critical reevaluation of current practices and prepare ground for further discussion and development of alternatives. Searching for existing "positive variance" (outlier pockets of excellent performance) provides similar value without the need to set up a new experiment. Unfortunately, the prevailing culture and incentives of public sector organizations seldom support experimentation. The development of more experiments in the public sector would require new incentives and strong leadership support.

**Input diversity**. Major strategic insights often originate from combination or collision of different types of knowledge. They require input diversity, i.e., contributions from experts with various knowledge, background, and fields of expertise. Shared cross-functional and interorganizational visioning, strategy, and foresight processes provide effective platforms for combining diverse inputs. These should not only involve the top leadership and policy specialists. Wider participation from different levels of the state administration and from all corners of society brings more diversity. Furthermore, modern communication technologies and social media allow the opening of the strategy process to the general public, which widens the government knowledge base to the "wisdom of crowds" and improves the public commitment to new strategies.

**Intense dialogues.** Combining diverse knowledge sets in an insightful way requires rich and sustained communication in a dialogue (Bohm 2004). However, developing and maintaining a high-quality dialogue face many challenges.

Organizational boundaries and practices may separate the experts with potentially synergistic knowledge. Functional or hierarchical divisions may be too strong for fruitful interaction. Separate premises may also prevent creative exchanges, particularly serendipitous meetings and conversations, while shared physical premises facilitate effective face-to-face communication to meld diverse knowledge.

The language of experts can become an obstacle to high-quality dialogue in two different ways. If they all use the same jargon, building on similar backgrounds and knowledge, phenomena not associated with the usual discourse perspectives and concepts can easily go unrecognized. On the other hand, experts with very different languages may not understand each other. Using a more universal, abstract, and concept-rich language that allows for abstraction and analysis can alleviate these problems. However, this should not sacrifice contextual detail and meaning. Finally, most decision-makers are tied up with daily operational tasks and have very little time to analyze complex strategic issues. Hence, successful governments have created spaces for thought, learning, and reflection to focus on the longer-term issues.

The integration of new knowledge into decision-making processes can also be supported by the use of internal analysts, consultants, or facilitators. They provide the necessary analyses of relevant systems and their causal interdependencies as well as shared concepts and new frameworks that support rich interpretations of strategic questions. Some governments have set up specific strategy teams and units for this purpose.

## Enabling Public Sector Resource Fluidity

High levels of strategic sensitivity and collective commitment do not mean much if key resources, such as capital and people, cannot be effectively reallocated to new challenges. Multiple priorities across constituencies make rigorous comparisons of social return for alternative activities or

investments impossible. As a result, opportunities for beneficial resource reallocation are difficult to identify and defend analytically. The lack of clear value comparisons of the expected net benefits of alternative policies emphasizes the role of common priority-setting rules and shared ambition in resource allocation. Contextual interdependencies between policies, making their costs and benefits dependent on the complete policy mix implemented (where the "bundle" of policies brings more, or less, value than the sum of the policies it is comprised of), are even harder to assess, making it difficult to target multiple policies at complex problems effectively.

Even when resource reallocation opportunities with better aggregate public value can be identified, freeing public sector resources for new uses is not easy. Public sector hierarchies tend to jealously guard their "established" budget appropriations against alternative uses. Their management systems are usually designed for functional optimization of resource use, not for dynamic reallocation of resources among different functions or policy areas. The incentive systems of public organizations are often linked to performing specific activities and processes rather than achieving sustainable results. Governments may also have to face a strong reaction from specific interest groups if they attempt to make strategic changes that have major distributional effects.

**Flexible budgeting**. The key principle for flexible resource allocation is to dissociate the past performance of the organization's various activities from resource control and future commitments. Put differently, budgetary allocations should be closely tied to the government's strategic objectives and not hostage to "legacy" commitments. Furthermore, responsibility for resource use does not necessarily require resource control. Access trumps "ownership," and programs may call on resources from multiple ministries, department, and agencies to be mobilized. A multidimensional organization with units cultivating and contributing skills and other resources, such as, for instance, the territorial infrastructure, to implement policy programs across their domains would provide more flexibility.

**Modular organization structures.** Rapid changes in organizational structures are difficult for traditional public hierarchies. Highly specialized, tightly integrated, and idiosyncratic management systems make organizational reconfigurations even more difficult and the development of new activities slow. Shared operating processes and similar subunit models and management systems obviously contribute to resource fluidity. Modular organizational solutions can also be easily replicated if needed. Shared resources are important for both cost efficiency and transparency, and they facilitate the redeployment of talent and funds to new uses.

**Shared information systems**. Data transparency and economies of scale in public services are highly dependent on shared IT/IS architectures and standards. Common nationwide architectures and standards across the public sector allow decentralized application and service development without the fragmentation and multiplication of systems so typical to public sector in most countries. This requires a nationwide high-powered CIO function with the necessary mandate to set the standards and oversee their localized implementation nationwide.

**Talent pool.** Open job markets, showing new position openings, coupled with individual career counseling, honest performance feedback, and long-term training opportunities can also improve the effective dynamic reallocation of human capital. Creating a cadre of senior leaders whose development is directly supervised by the leadership team not only provides a flexible source of managerial talent for new strategic needs but also builds shared understanding and collaboration among senior civil servants.

**Budgetary pool**. A government may also keep a part of the public sector resources in a common pool used when new needs arise in different policy areas. This would reduce the path dependency in public sector budgeting by breaking the link between past activities and the allocation of new resources. A continuous planning process with appropriate strategic intelligence capabilities is needed to guide such "flexible" or "zero-based" budgeting.

**Reallocation of responsibilities.** Besides resources, organizational responsibilities can also be reallocated to improve resource utilization and break rigid "siloed" reporting relationships. The responsibilities of specific ministers and administrative units can be broadened or narrowed by reallocating tasks among them. The role of the more capable or productive organizations and units can grow over time relative to the poorly performing ones. In principle, such reallocation should not be very difficult in public services that typically involve low fixed assets. Greater resource fluidity, however, will only contribute to strategic agility if senior officials, politicians in power, and other influential stakeholders can agree on how to use the resources freed up from routine commitments and organizational imprisonment and commit to effective integrated actions. Short of such commitment, making resources more fluidly available would only lead to heightened rivalry and bureaucratic conflicts.

## Strengthening Collective Commitment

Collective commitment to joint government action results from a deep cognitive and emotional sense of unity. Beyond principles and policies such as cabinet responsibility, this emerges from repeated successful collaboration around implementing integrated policies across different stakeholders. Efficient cooperation and coordination require that key decision-makers understand each other's points of view.

**Mutual understanding and dialogue.** Mutual understanding and commitment result from high-quality dialogue. Such a dialogue is informal and continuous, and it does not try to avoid conflicts that reveal differences in underlying assumptions and cognitive frames. High-quality dialogue cannot develop without sufficiently overlapping areas of expertise, which can be created through programmed job rotation. Public sector leaders also need sufficient time and opportunities outside of meetings to get to know each other's personal motives, values, and drivers in life.

**Shared agendas and incentives.** Beyond mutual understanding achieving collective commitment requires shared incentives, and a cross-departmental agenda focuses the leadership attention to common challenges, and wicked issues, instead of just subunit agendas. Governments can use various organizational mechanisms to act on that common agenda, for instance, assigning two different roles to each key official: one as a subunit leader and the other a wider cross-organizational responsibility, allowing the same person to shift frames between individual hierarchical and collective lateral perspectives. The goals and targets of various government subunits should also be transparent and fair. One way of achieving this is to have open discussions about each member's targets in the cabinet and their fit into a wider, societal outcome-driven common agenda.

**The rotation of top management teams in civil service.** Among senior civil servants, holding the same position for too long often leads to declining dialogue and personal engagement. Hence, moving senior personnel between ministries within the government fosters collective commitment (as the evidence suggests, for instance, from Singapore and the Netherlands). New responsibilities give experienced leaders new challenges and force them to learn new skills and perspectives and to emphasize leadership and implementation skills over specialized substantive expertise. Such rotation occurs rarely among senior civil servants, in particular, in countries with multiparty coalition governments. The bipartisan political systems have more mobility at the higher levels of civil service due to sharper electoral majority changes.

**Shared ambition.** Shared ambitions and a concern for effective policy bundles allow the various decision-makers to make decentralized decisions with their best knowledge about local circumstances while, at the same time, knowing where the rest of the government is heading. The development of a common ambition benefits from involving participants from all groups contributing to and affected by the expected changes, including citizens and civil society non-governmental organizations. The active participation and contribution of all interested parties create the necessary acceptance and commitment

to the decision outcomes, as well as the behavioral, organizational, and institutional changes required by them. Many reforms have been poorly implemented or have failed because they did not involve some important stakeholders in their development.

## Discussion

In the postwar decades, strong economic growth and a relatively stable environment provided a fertile ground for organizational and institutional rigidities to grow in governments. First, governments adopted the hierarchical and divisionally structured governance model of large diversified business firms. This governance model emphasized top-down planning and performance measurement in addition to more traditional bureaucratic rules and regulations. Over time, however, the growth of welfare state functions led to increasing organizational specialization between ministries and between departments.

In the 1970s, stronger citizens' expectations for more integrated and comprehensive government services beyond traditional sovereignty functions of state administration showed the inadequacy of hierarchical coordination for delivering such integrated services in a by then taken for granted increasingly all-encompassing welfare state. Specialized activities of a neither stable and uniform routine nor of a well-contained programmatic project nature, often also characterized by growing systemic complexity, such as health care, the prevention of delinquency or the fight against unemployment, or even the promotion of housing and urban redevelopment could not be integrated into the effective delivery of comprehensive services by separate delivery agencies and ministries. In sum, public administration hierarchies came to be recognized as too rigid to meet the demands of citizens and the complex challenges industrialized societies face. In this paper we have asked how did such rigidity arise and how problems related to this rigidity can be solved.

Large hierarchical public sector organizations and their planning logic performed well in the stable socioeconomic environment of the postwar decades in Europe, capitalizing on reconstruction, growth, and favorable demographics and building the welfare state. However, the need to react rapidly to change presents a major challenge to these organizations. This challenge is not new to public governance scholars. Lindblom (1959), for instance, noted long ago that real policy-making processes are characterized by incremental analysis and decision-making – or "muddling through" – rather than rational, comprehensive analysis and major policy reforms. However, the practical difficulties he noted in implementing the "rational-comprehensive" approach have not prevented policy-makers from holding it as an ideal upon which they base their policy-making processes. The development of decision-making theory within the policy sciences during the latter half of the twentieth century – and especially the contributions by March (1978), introducing the idea of garbage can model of making public policy decisions – paved way for new understanding of the nature of public policy decision-making, highlighting the nature of knowledge in decision-making process but also underlining the irrational aspects of decisions concerning public policies.

The growing interest in "evidence-based policy-making" (EBP) is an example of this conviction. Despite increasing amounts of data and analysis, EBPs have not been able to meet the challenge of enduring wicked problems or of the increasing complexity and uncertainty of the socioeconomic environment. Integrative efforts to create combined evidence by policy domain or even wicked problem areas have generated greater insight. But in addition to new evidence (some of which might not be available anyway given how slowly the true and most important consequences of policies often unfold in complex contexts) and analysis, these governance challenges require new interpretative frames and theories from policy-makers. As important as gathering proper evidence is, EBP is at its best when applied to narrow policy questions in relatively stable policy fields. Although "muddling through" – sometimes referred also to the staggering of the drunkard – has often been more

effective than hierarchical planning in dealing with complex policy problems, it faces its own weaknesses in a rapidly changing environment. The focus on incremental changes inherent to "muddling through" leads to path dependency and sub-optimization when major changes in a society or its environment call for comprehensive and more fundamental adjustments in policy directions. "Grand issues" are usually simply left off the agenda.

It seems that "muddling through" relies heavily on competing interests to point out the relevant information for decision-making. This increases the risks of incremental path dependency. Since entirely new issues and policy approaches and directions tend to have weak or nonexistent interest groups, the policy-making process is usually dominated by established interests and focused on salient immediate issues. Moreover, the day-to-day struggle and mutual adjustment of different political interests often exclude long-term issues from the political agenda. Thus, the incremental policy approach reinforces the tendency for short-sighted policy-making. Finally, a reactive focus on incremental "ills to be remedied" one by one does not produce a broader positive ambition that could coordinate and energize the decentralized change efforts of numerous interdependent actors. As a result, the various change efforts may lack sufficient motivation and drive to succeed, and the mutual adjustment of interdependent actors may not converge into any coherent and synergistic whole.

A new more integrated framework for coping with complexity and unpredictability and addressing the grand challenges of our time is hence needed.

## Conclusions

The dynamism and complexity of the current challenges fundamentally question the policy processes and governance approaches of our current government policies and practice. Countries and regions that develop a coherent and well-functioning governance process for this new dynamic and integrated environment will most likely perform best in the upcoming decades. Conversely, governments that adjust their governance slowly or only in a piecemeal way are likely to face low productivity growth, poor economic performance, growing public debt, and social decline, which may ultimately lead to social unrest and political extremism.

Strategic agility sounds like an oxymoron and the idea of strategically agile governments as a utopia. Yet, a concerted holistic change effort deployed along the three key dimensions of strategic agility we outlined here is not beyond reach. Political leaders and top civil service should possess a mind-set of an architect, i.e., not being just a skillful and successful operator in today's system, but a reflective reformist designing a more strategically agile system for years to come. Short of such reforms, today's governance policies and practices may slide into irrelevance in the midst of growing economic, social, and environmental disturbances.

This paper sets out the following research agenda:

First, public sector reforms are a rather well-studied research topic in the academic public management literature. Despite this and in the light of this paper, there is a need to better understand the meaning of fostering strategic agility – empirically, and in the form of country case studies – in transformative reforms taking place in OECD countries throughout the globe. This research builds up on the contents and public sector reforms – bearing in mind that it is useful to build on upon the strengths of public sector institutions and organizations rather than running reforms that tear down all existing public sector organizational structures. Second, further conceptual and theoretical attention to the adoption of a strategic agility approach is needed to understand the logic under what circumstances the need for more strategic agility emerges. Third, this paper's analysis calls for more detailed cultivation of the strategic agility from the leadership and management perspective. The evidence of this paper suggests that the choices and practices in fostering strategic agility are complex and culture-bound and strongly anchored in existing organizational cultures.

# Street-Level Bureaucracy

Cheryl A. Camillo
Johnson-Shoyama Graduate School of Public Policy, University of Regina, Regina, SK, Canada

## Synonyms

Administrative discretion; Daily program operations; Day-to-day policy implementation; Day-to-day program operations; Frontline bureaucracy

## Definition

The day-to-day implementation of government policies, typically enacted via statute or regulation, by frontline public servants, often on a case-by-case basis and in contact with the public and employing discretion. Also, the government bureaucracies responsible for the day-to-day implementation of policies. In addition, the study thereof.

## Introduction

Governments are responsible for protecting the public, providing mandated goods and services and raising revenues to perform these activities. In carrying out these responsibilities, some government bureaucracies transact directly with organizations and individuals. Generally, within these bureaucracies the highest levels focus on making policy, while the lowest levels concentrate on implementing it.

*Street-level bureaucracy* is the practice by the lowest levels of government of implementing public (i.e., government) policies via direct day-to-day transactions with individual members of the public. As such, it is important and significant. Support for government usually depends on its performance because the street level is the face of government to most laypersons. Plus, the street level consumes substantial portions of public budgets because transactions are numerous, unending, and labor-intensive.

This entry provides an overview of the study and practice of street-level bureaucracy. It describes street-level bureaucrats, their working conditions, and behaviors. It also discusses the impact of recent management trends and technological changes on bureaucracies and bureaucrats. It concludes by suggesting new approaches for improving understanding of them, as well as their performance.

## Street-Level Bureaucracy

Government organizations have a variety of missions, some of which require, in whole or part, direct interaction with individual constituents. For example, revenue agencies raise funds by collecting and processing tax returns, police departments ensure public safety by enforcing criminal laws, and health, social services, and education departments promote the public welfare by providing financial or material benefits to beneficiaries or by delivering services like adoption counseling and mathematics instruction.

Nearly all government organizations, or bureaucracies, have multiple levels. Policies, especially complex ones, pass through the levels before they reach individuals or organizations in forms, such as property tax bills, traffic tickets, and school vaccination requirements. The level at which they reach the public is called the street level. The term *street level* was coined by American scholar Michael Lipsky (1969) at a time when social scientists in the United States were especially concerned about urban policy problems but refers to any level at which government bureaucrats interact with clients, regardless of the setting.

Bureaucracies at all orders of government – federal, substate, local, etc. – have street levels since all orders of government transact with citizens. For example, in the United States (USA), the federal government makes Social Security payments to beneficiaries, states issues licenses to qualified drivers, and local governments operate primary and secondary schools for children and teens, among their many responsibilities.

Street-level bureaucracies differ from other bureaucracies in that a significant proportion of their employees are *street-level bureaucrats*, "public service workers who interact directly with citizens in the course of their jobs, and who have extensive [impact and] discretion in the execution of their work" (Lipsky 1980). The classic example of a street-level bureaucracy is a welfare office in which eligibility workers process applications on a case-by-case basis under the supervision of unit managers.

## The Origins of the Study of Street-Level Bureaucracy

The study of street-level bureaucracies began in the late 1960s in the United States when researchers were striving to understand how governments could effectively alleviate, if not eradicate, poverty and other difficult social problems. The optimism inspired by the mid-decade enactment of the Civil Rights Act, Medicare, Medicaid, and other progressive legislation was waning as problems persisted. In 1967, political scientist James Q. Wilson wrote: "The federal bureaucracy, whose growth and problems were once only the concern of the Right, has now become a major concern of the Left, the Center, and almost all points in between... Now that everybody seems to agree that we ought to do something about the problem of bureaucracy, one might suppose that something would get done." The problem of bureaucracy, he argued, was fivefold: accountability and control, equity, efficiency, responsiveness, and fiscal integrity. In late 1968, Jeffrey Pressman and Aaron Wildavsky began their now-renowned

study (1973) of an Oakland, California economic development program they found so "tortuous" and "frustrating" that they subtitled their book: *How Great Expectations in Washington Are Dashed in Oakland; Or, Why It's Amazing that Federal Programs Work at All*. As Brodkin later reflected (2012), street-level bureaucracy research brought "a growing literature on bureaucratic discretion into direct conversation with an emerging literature on policy implementation," both of which "tended to portray public bureaucrats as villains resistant to managerial and political control and at fault for frustrating policy goals."

Lipsky's (1969) paper *Toward a Theory of Street-Level Bureaucracy* and 1980 book *Street-Level Bureaucracy: Dilemmas of the Individual in Public Services* deepened the understanding of bureaucracies and program implementation by humanizing them: in other words, by describing the work of their employees – street-level bureaucrats – from the inside out as opposed to the outside in, as previous critiques had done.

## Street-Level Bureaucrats

Drawing from material on police, teachers, and lower-court judges, Lipsky concluded that street-level bureaucrats' work experiences are affected by common conditions:

1. Relative unavailability of resources
2. Existence of clear physical and/or psychological threats
3. Ambiguous, contradictory, or unattainable role expectations
4. Nonvoluntary clientele
5. Clientele who do not serve as a primary reference group
6. Limited control over clientele performance, yet high expectations and demands concerning that performance

Due to large caseloads, time pressures, and/or lack of information, street-level bureaucrats are often unable to develop a comprehensive understanding of the cases in front of them. As a result, they make expedient decisions. Examples include a policeman detaining everyone at the scene of a crime for fear of letting an unidentified criminal get away or a caseworker rejecting an application for benefits from an otherwise eligible individual because that applicant did not provide required documentation by a specified deadline. Such expedient actions typically generate more work for bureaucracies because clients challenge or appeal the decisions or reapply for benefits.

It is difficult to assess street-level bureaucrats' performance because of conflicting goals, inadequate measures, or insufficient data. They implement public polices, which, by definition, are designed to satisfy the broader public (i.e., multiple stakeholders), so expectations can be vague or conflicting. For example, medical associations might believe that the role of caseworkers in a means-tested public health insurance program is to expand access to healthcare services, while fiscal watchdogs might perceive it to be to limit access to the truly needy. Furthermore, it can be difficult to translate policy goals into pertinent performance measures. The goal of a public health insurance program might be to improve clients' health, but the eligibility caseworker might only be responsible for assessing individuals' health upon application to the program, so it would be unfair to evaluate him/her on changes in clients' conditions. Even if relevant measures can be developed, it can be difficult to obtain data for them. For example, it would be impossible to collect data on whether a cop detected all crimes on his beat in a given week because criminals would not report their activities voluntarily.

Street-level bureaucrats might have difficulty relating to their clients. They are working-class or middle-class professionals who are trained in a particular skill (such as nursing or social work) or public program (such as public health or crop insurance). They might not live in the jurisdiction in which they work (many public employers do not require their employees to live within the jurisdiction). In most cases, they are hired or promoted under merit rules without regard to personal background. Their clients will generally come from all subgroups within the larger community or from subgroups that meet financial or

categorical eligibility requirements, such as having limited income or maintaining a working farm. As a result, street-level bureaucrats and clients might not share a common culture or language.

As frontline workers who make and communicate decisions as to whether clients receive vital services or benefits, street-level bureaucrats are presented with physical threats, as well as challenges to their authority, including, as described above, appeals to a higher level, or even another branch, of government for a reversal of the bureaucrat's decision. With few exceptions, street-level bureaucrats cannot choose or drop clients, even noncompliant or uncooperative ones, because public servants are obligated to serve all citizens.

To cope with these working conditions, street-level bureaucrats commonly employ, with the assistance of their managers, the following psychological and organizational strategies:

- Simplification and routinization
- Compartmentalization and transfer of responsibility
- Segmentation and control of the client population

They convert casework into a series of paper/data collection, compilation, and entry steps and rely upon checklists, standards, and/or automated calculations, rather than judgment, to decide outcomes. When faced with ambiguous circumstances, they transfer cases to managers or special units for disposition. Upon determining that a case is "political" (meaning that it is of interest to high-ranking public officials or influential stakeholders), they attempt to erase their traces. If pressed by clients about procedures or decisions, they claim to be bound by "the rules." However, they limit exposure to clients by using tactics like letting phone calls go to voicemail or scheduling back-to-back appointments. They may even erect barriers to client access, such as delays or rudeness, as a way of rationing services or benefits. They reconcile all of these strategies in their own minds by demonizing their clients or at least certain segments of the client population. For example, they tell themselves "these people don't deserve it."

Per Brodkin (2012), "a corpus of studies that investigate how public policies have been shaped by street-level practices in areas as diverse as child welfare, education, prison reform. . .. have provided empirical confirmation that the types of coping strategies Lipsky identified are both prevalent and plentiful." These behaviors explain how and why policy is sometimes implemented in unexpected and unintended ways and why bureaucracies can be inefficient, unresponsive, and unaccountable.

Recent international governance research (Moller and Stensota 2017), however, suggests that "frontline responses are also grounded in the problem conceptions provided by the welfare state regime and its organization of solidarity." In other words, the sociopolitical context could shape bureaucrats' responses to working conditions and clients leading, for example, Scandinavian welfare state workers to view clients as being shaped by societal structures, while Anglo-Saxon and US welfare state workers believe clients are products of their personal characteristics and choices.

## Recent Study

Emerging lines of research are exploring the impact of technological advances and new public management (NPM) – the application of business practices, such as contracting, to public administration – on street-level bureaucracies. According to Brodkin's (2012) survey, studies show that NPM's emphasis on management by performance measurement has intensified the dilemmas of street-level bureaucrats and squeezed discretion out of their work. Bovens and Zouridis (2002) argue that new information and communication technologies (ICT), which enable workers and clients to perform tasks without interacting, have transformed street-level bureaucracies into systems-level (also called screen level) ones, thus transferring power from frontline public servants to systems analysts and software engineers.

## Conclusion

New technologies and management approaches will continue to be introduced to public bureaucracies. Even if they result in the reduction of jobs or discretionary authority at the street level, there will continue to be a need for police officers, nurses, and other frontline public servants. Undoubtedly, clients, taxpayers, policymakers, and others will expect quality, responsive, efficient, cost-effective, and accountable services from them. Given that research has confirmed Lipsky's theory that street-level bureaucrats' work conditions shape their behavior, scholars and public administrators should address these expectations, which are often incompatible in times of abundance let alone scarcity, while they seek to improve street-level bureaucrats' ability to meet them. Most importantly, they should collaborate in doing so. There has been a dramatic reduction in collaborative work between researchers and practitioners in recent years (Ni et al. 2017), which means that practitioners' perspectives are not being heard. Too often, "data are obtained, civil servants thanked for their assistance, and scholarly articles written for publication" (2017). Policymakers and higher-level public administrators also do not consult street-level bureaucrats before formulating and implementing policy (Camillo 2012, 2014).

## Definition

### Street-Level Bureaucrats

Street-level bureaucrats are "public service workers who interact directly with citizens in the course of their jobs, and who have substantial discreation in the execution of their work" (Lipsky 1980).

### Discretion

Michael Lipsky (1980) and Tony Evans (2010) define discretion as the "extent of freedom a worker can exercise in a specific context and the factors that give rise to this freedom in that context." Thus, the freedom or authority to make judgments and to act as one sees fit. Power to decide or act according to one's own judgment.

## Introduction

In his study "Street-level bureaucracy: Dilemmas of the individual in public services," Michael Lipsky in the 1980s argued about the behavior of front-line workers in policy agencies; the scholar (Lipsky 1980) referred to these front-line staff as "street-level bureaucrats." Street-level bureaucrats are considered pivotal players and front-line workers in the new public administration (Evans 2016). In actual fact they are de facto policymakers that informally construct or reconstruct their organizations' policies. They interact directly with the public and supply goods and services to the public though some scholars have argued that they usually have limited resources to do their job. They are public employees who deal directly with citizens and have substantial discretion in the execution of their duties. Examples of street-level bureaucrats are the police officers, teachers, general practitioners, and social workers (Tummers and Bekkers 2014).

Due to the complexity of most bureaucracies, their interpretations of organizational polices are key. It is, however, not surprising that some scholars have argued public policy that is not imposed top-down by senior managers. Rather, it is implemented and executed bottom-up by street-level bureaucrats (Tummers and Bekkers 2014). Street-level bureaucrats are to treat individuals in the society as clients; nevertheless the high demand for their services forces them to invent routines for mass processing.

The main argument underpinning this study is that street-level bureaucrats implement public policies (Tummers and Bekkers 2014). Nevertheless, they have to respond to citizens with a limited amount of information or time to make a decision. Besides, most of the times the rules the street-level bureaucrats have to follow do not link to the specific situation of the citizens involved. These have caused street-level bureaucrats to develop coping mechanisms to deal with the situation. They are able to do that because they have a certain degree of *discretion* or autonomy (Lipsky 1980).

The concepts, street-level bureaucrats and discretion have received wide attention in the policy implementation literature (Huber and Shipan 2002; Tummers et al. 2009). Despite the plethora of studies on street-level bureaucrats, a very limited literature has focused on how street-level bureaucrats (police) exercise their discretion in a positive or negative way (Sevä 2015). Moreover, scholars that have worked on the *concepts* have not explained enough theoretical proof regarding how street-level bureaucrats in the sub-Saharan Africa, Ghana, exercise their discretion.

It must be noted that the bureaucrats this study concerns about are the traditional Lipskyan street-level bureaucrats who have daily face-to-face contact with their clients/stakeholders such as police officers and teachers.

This study, drawing on the principal-agent theory, examines how police officers and teachers exercise their discretion. The chapter will shed light on the roles of the street-level bureaucrats (police officers and teachers) in maintaining law and order. The study will also focus on the comprehensiveness of the rules that the street-level bureaucrats implement.

## The Principal-Agent Approach

The principal-agent theory was developed in the early 1970s to assess congressional politics from

a positive theory perspective. However, Sekwat (2000) has indicated that in recent times, the principal-agent theory is growing rapidly in the areas of political science, sociology, health, organizational theory, finance, and accounting among others though it has its root in economics. The principal-agent theory is defined as "a contract under which one or more persons engage another person to perform some service on their behalf which involves delegating some decision making authority to the agent" (Jensen and Meckling 1976: 308). It must be noted that in the principal-agent approach, there is what Sekwat (2000) term as the "principal-agent relationship. This is manifested when principals' delegate works to the agents in return for reward or compensation. The principals depend on the agents to solve problems affecting the society. Moreover, the agents who meet the citizens (clients) or public directly are the street-level bureaucrats. They apply the rules that have been instituted by the state and exercise their discretion sometimes to suit the conditions on the ground.

Fleisher (1991) has specified in his study the conditions under which principals depend on agents to solve the problems affecting the society.

The first condition is that agents can perform the job they have been given more efficiently and at a lower cost than the principal.

Second, agents perform the work they are assigned to because the principals are not capable of performing certain tasks or lack the skills and expertise to provide the desired services.

Third, agents can serve as a symbolic signal to third parties and more importantly agents can act as an entrepreneur to resolve dilemmas requiring collective action.

## Linking the Principal-Agent Theory to Street-Level Bureaucrats and How They Exercise Discretion

Drawing lessons from the theory explained above, the *agents* in this study are the street-level bureaucrats (police, teachers, etc.). The *principals* are the officials or superiors who delegate responsibilities to the agents (street-level bureaucrats). The *clients* on the other hand are the individuals who receive services from the agents.

Tummers and Bekkers (2014) have submitted that certain amount of discretion by the agents (street-level bureaucrats) can increase the meaningfulness of a policy for clients (individuals in the society who receive directions and services from the agents).

To clarify this issue, a teacher who is a street-level bureaucrat (agent) could adapt the teaching method to the particular situations of the pupil (clients), such as his/her problems with long-term reading. However, this problem is eased when the teacher discusses the material to the pupil in groups. Through the teacher's discretion, he could devote more attention to the pupil's reading difficulties, thereby providing a more balanced development.

## Distinctive Features of Street-Level Bureaucrats

Hupe and Hill (2007) on street-level bureaucrats identified some characteristics to the concept.

The first feature is that street-level bureaucrats have discretion. Street-level bureaucrats have discretion because the nature of service provision calls for human judgment that cannot be programmed and for which machines cannot substitute. There is an interrelation between discretion and rules. Rules specify the duties and obligations of officials; discretion gives them freedom to act. Davis (1969) backed this assertion with this definition: "a public officer has discretion wherever the effective limits on his power leave him free to make a choice among possible courses of action and inaction."

Secondly, street-level bureaucrats are professionals. They are governed by "occupational or professional ideologies."

Street-level bureaucrats do their work in a micro-network or "web" of multiple, both vertical and horizontal, relations.

In the multidimensional micro-network of relations (web), street-level bureaucrats practice

multiple accountability. Within the variety of relations in the network that surrounds an individual street-level bureaucrat, specific clusters of accountability relations can be identified as ideal typically linked with various types of settings (Hupe and Hill 2007).

## Roles of Street-Level Bureaucrats

Keiser (2010) has stated that street-level bureaucrats play vital roles in influencing policy implementation through their attitudes and values. In a similar study at the US Forest Service, Meyers and Vorsanger (2007) have argued that personal attitudes and values of bureaucrats are important because it helps in understanding bureaucratic behavior.

Lipsky (1980) argues that street-level bureaucrats perform policy-making roles. These roles are built on two vital characteristics: relatively high degrees of discretion and a relative autonomy from organizational authority.

In Ghana, the Ghana Police Service act 350/70 has been enacted by Parliament to empower the police officers to perform five (5) traditional roles. They are indicated as follows:

(a) Protect life and property
(b) Prevention and detection of crime
(c) Apprehension and prosecution of offenders
(d) The maintenance of peace and order
(e) The enforcement of all laws with which it is directly charged

## How Comprehensive Are the Roles? Are They Ambiguous?

It appears the roles of street-level bureaucrats according to scholars (Matti and Sandström 2013; Sevä 2015) are comprehensive. Street-level bureaucrats focus on core beliefs, empirical and normative, which gives a comprehensive and detail picture of their roles. Supporting this assertion, Lipsky (1980) has stated clearly that street-level bureaucrats exercise their roles through a relatively high discretion and a relative autonomy. Sevä (2015) has also offered a more comprehensive framework for understanding the roles of the street-level bureaucrats.

However, due to bureaucrat's behavior toward policy preferences, it does not help explain their roles very well, and this makes their roles ambiguous (Keiser 2010). Policy goals by actors are strife with ambiguity; policy actors often have conflicting notions of what they seek to implement (Hill and Hupe 2002). This ambiguity is inherent in many public policy situations. There is ambiguity where multiple ways of thinking exist about the same circumstances or phenomena (Feldman 1989). With regard to street-level bureaucrats, there are several ways they can exercise their discretion on a policy. Thus, street-level officials have multiple meanings to a policy. This makes their roles conflicting and ambiguous. Under ambiguous policy roles, street-level bureaucrats may all work and yet still have variation in the decisions that they make because each street-level bureaucrat may have a different understanding of what he or she is supposed to do.

For example:

> Ghana police officer checking traffic on the road upon seeing a car, lorry or trotro (public transport van) may stop the vehicle to examine its roadworthiness. When the officer sees that the driver to the vehicle is not having an authorized driving license, loose tyres or the vehicle is in a blatant state of disrepair, the police officer may decide on the appropriate action against the driver. Some police officers may require the drivers to pay a fine; other officers may arrange the offenders to court. In some cases offenders would be given a warning or caution not to repeat the offense the second time.

It can be seen from this example that Ghanaian police officers have a particular way of enforcing the law. Some prefer to take money from the offenders; others also take the offenders to court. This shows the ambiguity in their roles. There is no one way of exercising their discretion; it is dependent on the kind of situation or circumstances at the time. The ambiguity of their (street-level bureaucrats or the police) roles causes civilians (clients) to criticize the meaning that they give to the law (Beek 2016).

## How Street-Level Bureaucrats Exercise Their Discretion

It has been established in the preceding page that street-level bureaucrat's roles may be comprehensive but ambiguous. Nevertheless, in performing their roles discretion is crucial. Lipsky (1980) has pointed out that, "Discretion provides opportunity to intervene on behalf of clients as well as to discriminate among them." Discretion can provide flexibility for bureaucrats, and limiting discretion can create as many problems as it solves. Through discretion police officers, for instance, can know the best way to handle a fight, when a neighbor threatens violence against another, when juveniles are suspected of vandalism among others. Discretion will also enable agents (police officers) to arrest, mediate, investigate, warn, laugh, or do anything.

It is important to note that discretion can be exercised through agents experience (Sherman 1984) and the kind of situation at hand (Bronitt and Stenning 2011).

## Experience

Why do street-level bureaucrats like the police exercise their discretion through experience? There is a saying that "experience is the best teacher." Experience helps street-level bureaucrats to give good judgment. Jay (2005) has posited that experience is the foundation of all empiricism and the antidote to superstition, dogma, or religion. It is the source of truth about the physical world. Experience can be direct and indirect. Scholars (Sherman 1984; Jay 2005) have argued that direct experience is better than the indirect, and both are better than assumption. Police and teachers have direct experiences with people's responses to their behavior. The police cannot credibly claim that experience is an adequate basis for their exercise of discretion when they are denied the information required to give them the necessary experience (Sherman 1984).

## Situation at Hand

The situation at hand can inform a street-level official on the kind of judgment to give on a case. Some of the techniques or mechanisms by street-level officials may be useful in a situation, other situations too it may not. Situations that confront street-level officials are unique, that cannot be generalized. An officer must interpret a situation in order to exercise appropriate discretion in respect to it. For example, in investigating a road crash, a police officer may decide whether the situation was a genuine accident or whether the circumstance leading to the incidence fulfils the requirement of an offense or careless driving by the drivers.

The discretion that street-level bureaucrats exercise according to Tummers and Bekkers (2014) can be positive and negative. They exercise their discretion positively when they have positive behavior intention toward the implementation of the policy. The positive behavior intentions exhibited by the street-level bureaucrats are as results of their professionality and expectations of discretion and autonomy when it contradicts the notions of bureaucratic control (Freidson 2001).

Negatively, street-level bureaucrats can discriminate or show favoritism to their clients when exercising discretion. When this happens, Sandfort (2000) has indicated that it can break public trust.

## Conclusion

The novelty of this study was to unravel the concept of street-level bureaucrats and how they exercise discretion. It underscores the importance of studying discretion. Through the principal-agent theory, the study explained the principal-agent relationship and how street-level bureaucrats exercise their discretion. The core dilemma of street-level bureaucrats is that their roles are comprehensive according to scholars but ambiguous due to their conflicting and contradictory nature. Street-level bureaucrats exercise their discretion through experiences and situations they come across. Research shows that discretion can be exercised positively and negatively based on behavior intentions of the agents. The analysis of

this chapter suggests (though not conclusively) that it would be appropriate if Ghana and other African countries reforms concentrate more on the activities of the street-level bureaucrats and how they exercise their discretion. The focus on the bottom-up approach to policy implementation which involves the street-level officials will help attain policy goals, and it will bring about development.

# Street-Level Leadership

Michael Macaulay
Institute for Governance and Policy Studies, Victoria University of Wellington, Wellington, New Zealand

## Synonyms

Citizen orientation; Frontline leadership; Public-facing leadership

## Definition

Street-level leadership is exercised by frontline public service staff through their use of professional discretion.

## Introduction

The origins of street-level leadership can be found in Lipsky's (1980) *Street-Level Bureaucracy.*

Needless to say there are many different types of street-level bureaucrats/practitioners – police officers, firefighters, social workers, carers, etc. – all of whom face their own specific leadership challenges and issues. What unites them all is that they are the most public-facing of public servants: "[the] public service workers who interact directly with citizens in the course of their jobs, and who have substantial discretion in their work" (Lipsky 1980: 3). Although Lipsky's concept was initially treated with a degree of skepticism, it is now widely acknowledged as an irreducible arena of public service debate: as Dicke (2004: 248) suggests, "street level leadership occurs because it must." Its centrality in policy and public management discourse has only been strengthened by the continuing professionalization of such frontline services, which has resulted in the concept expanding to fit many new domains.

Street-level leadership is not just regarded as the customer face of public policy but often comes to be regarded by clients and service users as the *embodiment* of such policies. At its heart is the use of *discretion*; how such discretion intersects with a practitioner's legitimacy and authority forms the cornerstone of discussions around street-level leadership. The interplay between discretion, legitimacy, and authority can give rise to a number of interconnected issues of, for example, accountability, rule breaking, and ethical standards. As Vinzant and Crothers (1998: 73) suggest: "to portray the challenges and demands these workers face as being simply a matter of morality, ethics, institutional and regime values, bureaucratic responsibility, professionalism, or good judgement is incomplete. It is all those things simultaneously." This chapter will now attempt to unpack some of these thorny challenges, beginning with the nature and manifestation of discretion in street-level leadership.

## Discretion

To some extent, discretion must be exercised by all public servants at a variety of levels. Indeed it is not unreasonable to suggest that anybody involved in translating political and legal ideas into firm policies or management practices must use their individual and collective discretion (Sowa and Coleman Selden 2003; Evans and Harris 2004; Keiser 2010). Nevertheless discretionary power plays a central role in street-level leadership for a number of reasons that were initially identified by Lipsky (1980) himself.

Street-level practitioners find themselves in unusually complex daily environments and are required to react to unknowable stimuli. There can be no standard response for these various situations, even if there are consistent standards of conduct that may be drawn upon. To compound this, street-level leadership necessitates a specifically human response, as frontline public servants must engage in direct, physical relationships with people. Finally it is frequently the case that street-level practitioners are not in positions of direct supervision; they must fend for themselves and in so doing improvise around official guidelines and face-to-face reality. For all of these reasons, discretion and professional judgment are thus essential elements of street-level leadership.

As indicated above there are, of course, possible drawbacks to the role of discretion in street-level leadership, and the ethical dimensions have long been recognized (Loyens and Maesschalck 2010). One long-standing issue is the extent to which discretion can turn into, or at least be interpreted as, noncompliance and divergence from official procedures and protocols. Although similar these two variations are not synonymous: "noncompliance focuses more the *unwillingness* of street level practitioners to follow policy, divergence focuses more on the *actions* of street level practitioners and the gap between this action and policy" (Gofen 2014: 474). Another concern is that street level leadership can go beyond the limits of discretion and, consciously or otherwise, make decisions for their own rather than a public benefit (DeLeon 2005). Like discretion itself, divergence and noncompliance have been identified at all levels of public service, leading O'Leary (2010), for example, to coin the idea of "guerilla government."

The importance of divergence here, however, is that it directly impacts upon other crucial areas of street-level leadership: legitimacy and power. As Dicke (2004: 234) argues: "at the street-level, bureaucrats can be criticized for making decisions

based on the actual fact-based situations but rather on rules rigidly applied – being 'too bureaucratic.' Street-level practitioners ultimately lose some of their legitimacy whenever these conditions exist." Thus street-level practitioners are sometimes portrayed as simultaneously "powerful and helpless" (Arnold 2015: 310) in that they regularly are required to deal with situations that allow them the freedom to exercise their discretion, but are also are beset by competing and contradictory claims by clients and citizens. How, then, does this translate further into practice?

## How Is Discretion Exercised in Street-Level Leadership?

One way to distinguish between such competing claims is to recast the discussion in more traditional language. As Brodkin (2012) suggests, much of the discussion around discretion in leadership is in reality about *control*, at a variety of levels: the street-level practitioner trying to control a particular situation and environment but also managerial control to ensure that street-level practitioners act within their allotted authority. Inevitably, the fine judgment class that street-level practitioners use to exercise discretion can be open to ethics dilemmas.

Tummers and Bekkers (2014) argued that there is a positive correlation between discretion and policy implementation. They discovered that the higher the level of discretion that street-level practitioners can exercise over a policy, the more willing she or he is to implement it. Such observations relate back to Vinzant and Crothers' (1996, 1998) framework for the way in which discretion can be exercised. They identified both transactional (situational) and transformational (value) dimensions. Street-level leadership is situational in that it requires street-level practitioners to exercise discretion over *processes* (e.g., firefighters deciding the best way to tackle a blaze). Value-based aspects come through the utilization of discretion over *outcomes* and in particular whether or not to act at all (e.g., a police officer deciding whether or not to issue a speeding ticket). The transformational aspects of street-level leadership are aligned to notions of stewardship, which challenges the traditional view of transformational leaders residing at the pinnacle of organizational leadership structures (Vinzant and Crothers 1996: 468).

Plotting these two dimensions against the extent to which street-level practitioners could exercise discretion, Vinzant and Crothers (1996: 470) suggested that not all street-level practitioners could exercise high degrees of street-level leadership. Many could use little discretion in either process or outcome, and in these situations, street-level practitioners simply follow procedure rather than actively influence a policy. Those with substantial discretion over process but not outcomes were firmly in the situational leadership camp; conversely street-level practitioners who had high degrees of discretion over outcomes but not processes were aligned to transformational (values-based) leadership.

Yet in situations whereby street-level practitioners find themselves with considerable discretion over both process and results, they exercise both transformational and situational leadership, which has a number of further implications. Several commentators have suggested that one possible impact of such high degrees of street-level leadership is that street-level practitioners manage to cocreate solutions with clients and citizens, which makes those policy solutions more meaningful for both (May and Winter 2009). In turn this makes street-level practitioners feel that they are making significant positive differences to people's lives and are therefore more enthusiastic in implementing policies (Tummers and Bekkers 2014: 541). Arguably this transformative effect is something that can be traced back to Lipsky himself, who was promoting improvements in street-level leadership as much as he was trying to map its terrain (Brodkin 2012).

## The Increasing Ubiquity of Street-Level Leadership

Yet in recent discussions, there has been a slightly more circumspect approach to the benefits and limitations of street-level leadership with an

emphasis on how street-level practitioners try and fill public service gaps (Hupe and Buffat 2014). Much of this new emphasis is down to the ever-changing landscape of public policy and management. Our world is very different to the one in which Lipsky first offered up his ideas. Scholars have subsequently drawn attention to street-level leadership as a means by which street-level practitioners manage workloads (Brodkin 2011) or other occupational pressures (Hupe and Van der Krogt 2013).

New forms of governance have cast an increasing emphasis on hybridization, collaboration, and coproduction, all of which recast the role of street-level practitioners in numerous directions. One interesting discussion is what the role of technology will continue to play in the exercise of street-level leadership. As digital governance becomes increasingly prevalent, there have been countless shifts in the transactional relationships between citizens and government agencies that have brought the whole notion of a customer-facing public service into question: who can be classified as a street-level practitioner?

With the rise of outsourcing and externalization, for example, frontline workers could easily occupy call center positions. These street-level practitioners may have direct customer-facing relationships (even if these are via a phone call rather than face to face), but yet such workers have very little, if any, opportunity to exercise discretion. Questions also remain as to gaps between professionals and nonprofessionals in collaborative relationships (Tummers and Bekkers 2014) as well as the extent to which clients can successfully interpret the decisions of street-level practitioners or whether they are remain bound by the red tape of bureaucracy (Moynihan and Herd 2010).

A more positive recent development has been the recasting of street-level leadership in terms of street-level policy entrepreneurs who "seek to develop or adopt policy innovations intended to improve the implementation processes they prosecute and to entrench those innovations in the day-to-day activities of bureaucratic peers" (Arnold 2015: 309 also see Petchey et al. (2008)). In one sense this concept is a return to Vinzant and Crothers (1996, 1998) and the emphasis on discretion over policy outcomes. In another sense, however, it has echoes of Moore's (1996) public value, with its normative emphasis on public servants directly creating value for customers and clients especially at the street level, as demonstrated by his famous story of the local librarian and the after-school club (see Moore 1996: 8–13).

## Conclusion

What all of the above signifies is the ubiquity of street-level leadership crosses a range of different areas of public policy and public management. As Brodkin (2012: 943) suggests, street-level leadership research has covered the full spectrum of policy studies, providing "a corpus of studies that investigates how public policies are shaped by street-level practices in areas as diverse as child welfare, education, prison reform, health care, workplace safety, workforce development, welfare, juvenile justice, corrections, and more." Yet even this list barely scratches the surface; the exercise of discretion and its links with legitimacy and authority are constants, and looking forward within the broader context of leadership studies, this crucial interplay will doubtlessly reoccur again and again.

# Strengthening Financial Accountability Through Budgeting

Maukesh Basdeo

## Synonyms

Accountability; Budget process; Budgeting; Committees; Parliaments

## Introduction

> The finance of the country is ultimately associated with the liberties of the country. . . If the House of Commons by any possibility lose the power of the control of the grants of public money, depend upon it, your very liberty will be worth very little in comparison. That powerful leverage has been what is commonly known as the power of the purse – the control of the House of Commons over public expenditure.
>
> William Ewart Gladstone, 1891

In the last decade, focus has moved from a traditional focus on central governments or the executive to greater analysis of public and private governance structures. From the discourse on governance issues like transparency, accountability, responsiveness, and forward-looking policies, it soon became clear that legislatures are a vital part of the overall picture. Hence the need to strengthen the "real" power of parliaments. Informed and knowledgeable legislatures provide countries with comprehensible policy and legislation and also provide the legitimate democratic check on executive policies and actions. However, this is a period of time when parliaments are making great changes in the way they work. Perhaps the most important aspect of parliamentary oversight and, therefore, an area of intense interest is financial accountability through budgeting.

The budget can be considered as the most important economic policy tool of an executive and offers a broad statement of the priorities of a

country. Therefore, parliaments have important roles to play in guaranteeing oversight of the budget and the enforcement of financial accountability. Participation in the budget process institutes provides checks and balances that are essential for financial accountability of the executive and at the same time ensures efficient delivery of public services. Because as the representative institution of the people, parliaments are the fitting place to ensure that the budget optimally matches a country's needs with available resources.

This paper explores the relations between parliaments and fiscal accountability in the oversight of executive finances during the latter stages of the budget process. The paper uses the Trinidad and Tobago Parliament as the means to evaluate the linkages between parliament and financial accountability.

Given that executive presents spending programs to Parliament in order to exercise its mandate and implement set policies, explicit parliamentary approval is constitutionally required for these financial plans proposed by the government; parliament is vested with the unique opportunity to increase its influence and scrutinize those financial plans proposed by government effectively, in order to deliver value for money to all taxpayers whom they represent.

What is a budget and what purpose does it serve? The following sections bring together the definition of a budget and some interrelated core concepts.

## Definition of the Budget

The word budget is developed from the French word *bougette* or "small bag." The legal definition of the budget is contained in a French decree of 1862: "The budget is a document which forecasts and authorizes the annual receipts and expenditures of the State. . ." (Stourm 1917, p. 2). By the mid-1860s, France had developed an accounting system, which was applied to all executive departments together with the standard fiscal year. A system of reporting was similarly developed as a requirement for all executive departments to explain and account fiscally for funds which they were allocated. Henceforth, the budget emerged to become one of the executive's principal policy documents.

The term found its way to England where it came to be referred to as the leather bag in which ministers of the crown carried financial plans to parliament and eventually it became synonymous with its contents. However, British budgetary practices by the mid-1800s fell short of the technical features of the French budgetary system and lacked the reliability and universality of application that was central to the underlying public sector budget process. It was when William Gladstone served as Chancellor of the Exchequer and later as Prime Minister did him and other reformers incorporated several of the French budgetary procedures as a way of controlling executive finances. For instance, the establishment of the Public Accounts Committee in 1861 and the offices of the Comptroller and Auditor General in 1866 were created in England. Placing substantial emphasis on the notion of balancing the budget became the principal feature of Gladstone's budgets (Webber and Wildavsky 1986). Currently, the budget in the United Kingdom refers to the financial statement, which centers on taxation measures. In most countries, the term refers to the annual expenditure and revenue plans which is drafted by the executive and tabled in parliament for examination and authorization before the beginning of the fiscal year to which it applies.

## Contemporary Developments in Legislative Budgeting

If resources were unlimited, citizens could get whatsoever from the government making the need of a budget pointless. In actual fact, spending needs are unsurprisingly outside existing funding. Hence, governments have to make choices about the allocation of limited resources to meet contending needs in society. It is for this reason that budgeting takes place within a political arena and the outcome is a political document through which money is appropriated according to value

judgments by decision-makers to reflect the community's values, preferences, and priorities (Gildenhuys 1997).

The development of legislative fiscal power was at its pinnacle in the second half of the nineteenth century, when the House of Commons repeatedly modified expenditure and revenue proposals (Einzig 1959). The extension of parliamentary democracy during this period ensured that the principle of legislative endorsement of public revenue and expenditure turn into an ultimate constitutional principle across democratic countries. However, from a long-term perspective, the influence of national legislatures on budget policymaking has declined in most countries (Coombes 1976). The budgetary decline of parliament is perhaps most evident in the United Kingdom, where the House of Commons ceased to amend estimates almost a century ago.

A number of factors contributed to the reduction in legislative financial accountability of budgets (Schick 2002). One such factor was the advent of disciplined political parties which reigned in Member of Parliament independence. Moreover, decentralization of spending has chiseled away at the complete control of public funds by parliaments. Therefore, the development of public expenditure and the growing intricacy of public finances via executive budget proposal became the contradiction against which legislative action was measured. However, the decline of parliamentary scrutiny over budgets is not widespread. There are signs that some countries are attempting to bring back financial scrutiny of the budget. The resulting changes include a reclassification of the budget in order to support parliamentary oversight and an expansion of powers to amend expenditures (Chabert 2001).

## Legislative Approval of the Budget

The role of parliament in approving the budget differs sharply across different countries. As a general rule, legislative budgetary powers are described in country's constitution. In addition, the Standing Orders of a parliament which encompass internal rules and procedures contain provisions and also regulate the budget process. In the formulation stage, the executive power plays a predominant role in budget policymaking restricting parliament to a secondary role. Confronted with constitutional restrictions on their right to introduce financial legislation. Parliamentary scrutiny tends to be greater at the authorization stages of the budget process; this is where parliamentarians can propose amendments, adopt the budget, oversee its execution, and control performance. Therefore, parliament's main roles are to review and debate the government's draft ex ante budget and to authorize spending to implement the annual budget plan.

Legislatures founded on the Westminster tradition cannot initiate financial bills and have restricted powers to make changes to the government's financial proposals. Such parliaments may only decrease existing items proposed by the executive; its amendments cannot contain new items, nor can it cut funds, and cannot increase expenditure on a different item elsewhere in the budget. This arrangement was developed in the House of Commons, when it met to deliberate demands for subventions made by the crown. Its duty was to resolve whether and to what degree it would comply with the demand, rather than to initiate its own spending plans for the monarch. Many countries in the Commonwealth have embraced this arrangement.

## Strengthening Financial Accountability in Government Budgeting in Trinidad and Tobago

The national budget is possibly the most important and comprehensive policy for the Central Government in Trinidad and Tobago to implement its economic policies. It has an impact on every sector of the economy as well as every section of the population. The policies motivating the budget and implementation of the proposals have direct importance to the whole population. However, neither the budget process nor do the budget policies come under substantial public scrutiny. Thus, the need for establishing

accountability for budgets cannot be overstated in a country like Trinidad and Tobago.

## Budget Formulation

In parliamentary systems, the preparation of a budget is seen as an executive's fundamental responsibility. Following this tradition, the government in Trinidad and Tobago prepares the budget in accordance with Article 113 (1) of the constitution, which states that the Ministry of Finance shall cause to be prepared and laid before the House of Representatives before or not later than 30 days after the commencement of each financial year estimates of the revenues and expenditures for that year. Correspondingly, the Exchequer and Audit Act outlines the functions of the Ministry of Finance in relation to the management of the budget preparation process and the implementation of the budget. Across political systems there are variances as to the degree of consultation that might take place between the executive and the legislature. The question that needs to be answered is whether it is possible for the legislature in Trinidad and Tobago to have an involvement in budget preparation without compromising the core responsibility of the executive.

In Trinidad and Tobago, the time allotted for budget preparation commences with the issuance of the budget call circular, which initiates budget hearings typically lasting 8 weeks. Ministries are required to present their estimates of required annual expenditure by 30 April of each year. Following the submission of the estimate of needs, the Ministry of Finance and the ministries commence a consultative process. In addition, the executive holds some limited consultations with the public as part of its process of determining budget priorities. Once all the estimates are in, including those from wider society, the budget can be finalized and approved by cabinet. Yet, at no point is the parliament involved in the process. Should there be pre-budget discussions between the executive and the parliament?

The OECD recommends that a pre-budget report should be released not later than 1 month subsequent to the tabling of the budget proposal in parliament. The report should consist of the executive's long-term economic, fiscal policy objectives and the executive's economic and fiscal policy plans. Similarly, the OECD recommends that parliament must have the opportunity to effectively examine any fiscal report that it deems necessary. Still, the executive does not release a pre-budget report in Trinidad and Tobago.

Experience in other parliamentary jurisdictions validates the preparation of a per-budget report input to the budget process. In the United Kingdom were the budget had always been the prerogative of the executive. These days the UK Treasury Select Committee undertakes an examination into the pre-budget report which includes evidence from the chancellor and other officials and experts. As the Organisation for Economic Co-operation and Development (2002) best practices state "A pre-budget report serves to encourage debate on the budget aggregates and how they interact with the economy. As such, it also serves to create appropriate expectations for the budget itself".

There are additional examples within the Commonwealth that allows for legislative participation in the budget formulation process. The Finance Committee of the Ghanaian Parliament conducts pre-budget consultations with the Ministry of Finance. The same applies to the Parliament of Uganda which is given 3–4 weeks to report its views on the government's budget framework paper. In Canada, the House of Commons Standing Committee on Finance organizes public hearings on an economic and fiscal update that is presented by the government months ahead of the formal presentation of budget.

Thus far the Trinidad and Tobago Parliament has not been used as a means of injecting an element of public opinion into the formulation of the budget. As the 2008 Public Expenditure and Financial Accountability (PEFA) Report states, the legislature review covers fiscal policies and the details of revenue and expenditure estimates, but only at a stage where for all practical purposes detailed proposals have been finalized. As well as the lack of formal inputs, the parliament does not

appear to exercise any informal influence over the pre-budget process.

The lack of a pre-budget report does not inhibit the Trinidad and Tobago Parliament in taking the initiative to improve their own and the public's participation in the budget formulation stage. The new Joint Committee on Public Appropriation and Administration Committee could hold hearings on some of the relevant ministries' plans for the forthcoming year. This would ensure improved collaboration between the parliament, ministers, and bureaucrats, thereby allowing parliamentary committee to give advice and provide suggestions on the future direction of services and programs. This has proved possible in other small jurisdictions, e.g., Scotland and the over 5-year session of the Trinidad and Tobago Parliament can use the annual budget cycle to get civil society and the private sector to appear in front of a parliamentary committee to give evidence at some stage of the budget process, thereby enhancing scrutiny of budget formulation stage.

## Budget Approval

International experience recommends that a budget should also be tabled in the legislature well in advance of the commencement of the fiscal year to ensure financial transparency. The practice recommends that the budget should be tabled as a minimum 3 months prior to the start of the fiscal year. However, countless disparity occurs, e.g., in the United States, it must be submitted 8 months in advance of the fiscal year; in Denmark, Germany, and Norway, the time limit is 4 months; whereas 3 months is suggested in France and South Korea.

In Trinidad and Tobago, Article 114 (1) of the Constitution states that the budget must be presented 1 month prior to the commencement of the fiscal year. This practice is in keeping with many countries operating the Westminster system. Standing Orders 81–88 of the House of Representatives detail the procedures governing the budget approval process. Directly after the presentation of the appropriation bill, the Ministry of Finance is permitted to move the second reading which is the occasion for the budget speech. After the budget speech, the Ministry of Finance sets a date upon which the debate on the second reading shall be resumed which shall not be less than 3 clear days after the budget speech. The debate is restricted to 4 days and is confined to the financial and economic state of the country and the general principles of government policy and administration. Compared to the United Kingdom, the debate lasts for a week.

Subsequently after the debate is completed, the House of Representatives goes into Finance Committee of the whole House to consider the bill. The revised Standing Orders of the House of Representatives in 2014 permitted a considerable change and provided additional transparency and accountability in the budget process. For the first time in September 2014, for a period of 5 days, the Standing Finance Committee took up the task of examining the budget's 50 heads of expenditure. The Finance Committee House embarked on scrutinizing the budget, and for the first time, the opposition had the opportunity to decide the sequencing of questioning of government ministers and accounting officials. Though the budget review was conducted in camera before, following the review of the Standing Orders, the Finance Committee conducted the hearings in public and broadcasted live. Overall, the Finance Committee 2014, heard from over 400 government officials which provided information to the public.

To further strengthen the budget approval process, the Trinidad and Tobago Parliament seized the advantage to establish a Parliamentary Budget Office (PBO). With the assistance of the UNDP, a senior budget expert was recruited, who arranged the policy framework for the PBO (Draman 2015). It is envisioned that the PBO will make available excellence research that is autonomous of the executive and ministries in order to support members of parliament and committees of the House.

## Budget Implementation

Comprehensive monitoring of government expenditure by the Trinidad and Tobago

Parliament is to a certain extent lacking. This is partially because of lack of information; in-year reports providing a report of the budget's effects during the budget year are not produced, although there will be some media briefings to inform the public about actual revenues and expenditures.

The revised Standing Orders have fortified the powers of the PAC and PAEC. In particular, Standing Orders 99(2) and 100(2) empower both committees to consider whether policy is carried out efficiently, effectively, and economically and whether expenditure conforms to the authority which governs it. This is directly in line with the value for money audits. Hence, in theory both committees can consider issues of efficiency and economy of program implementation (Stapenhurst et al. 2013). Yet the practice of performance auditing and review of effectiveness of policies and implementation is only starting to be addressed in Trinidad and Tobago.

This paper further emphasizes the necessity to clearly differentiate the contribution of legislatures to budget policymaking in the different phases of the budget. Although the management of public expenditures should continue within the purview of the executive, the role of the legislature in Trinidad and Tobago is critical to ensure that the executive is held accountable for the manner in which it allocates, executes, and oversees public spending. Comprehensive economic governance calls for the effective and responsible oversight of the budget by the parliament. Besides, by strengthening the instruments of accountability in budgeting, legislative scrutiny of the budget is expected to develop, over time; the credibility of scrutiny of the budget provides effective restraints on executive discretion in public expenditure management.

# Stress Management

Maureen Dollard, Amy Zadow, Silvia Pignata and Tessa Bailey
Asia Pacific Centre for Work Health and Safety, University of South Australia, Adelaide, SA, Australia

## Synonyms

Building psychosocial well-being; Improving psychosocial safety; Job stress prevention; Management of psychosocial factors at work; Managing work-related psychological distress; Occupational stress interventions; Preventing emotional exhaustion, burnout, anxiety, and depression at work; Preventing work-related mental disorders; Preventing work-related psychological injuries; Psychological health promotion; Psychosocial risk management; Psychosocial strain prevention; Supporting workplace mental health; Work stress prevention

## Definition

Work stress refers to the damaging physical and psychological reactions that occur when individuals are unable to manage work conditions, often due to high levels of work demands and insufficient job resources. Stress management refers to actions to address the causes of stress and its consequences at the individual, organizational, industry, and/or national level by reducing the stressor, modifying or changing the stress response, or by treating the stress-related health problem to reduce the detrimental impact of work stress on employee health and well-being. Psychosocial risks (or work stressors) are aspects of work that have the potential to cause stress such as a demanding workload, and low levels of job autonomy or social support and social relational aspects (e.g. bullying, harassment).

## Introduction

Stress management at work has received increasing attention as recognition builds that safe and healthy workplaces are a basic human right. National health and safety frameworks across the world have identified the need to address the causes of workplace stress (e.g., Psychosocial Risk Management Excellence Framework (PRIMA-EF) in Europe, the Guideline for Promotion and Maintenance of Mental Health of Workers in Japan, the Mental Health Commission in Canada, the Korea Occupational Safety and Health Agency Stress Management Guidelines, the Health and Safety Executive in the United Kingdom, the National Institute for Occupational Safety and Health (NIOSH) research program in work organization and stress-related disorders in the United States, and the Australian Workplace Barometer in Australia). Several theoretical models have been developed to explain how job design and work conditions affect workplace stress. More recently, the organization and system factors, such as the psychosocial safety climate (PSC) (Dollard and Bakker 2010), that precedes the work conditions have been identified. To examine approaches to stress management the models defining stressful work conditions will be described, then macro level and organizational stress management approaches will be outlined, followed by a review of stress management intervention approaches.

Work-related stress refers to the harmful physical and psychological responses that occur when demands at work exceed the capacity of individuals to cope, often because of inadequate job resources; in time these negative responses can

affect mental and physical health or well-being (International Labour Organization 2016). Research shows clear links between stressors and psychological health including emotional exhaustion, burnout, anxiety and depression, and physical health such as cardiovascular disease and musculoskeletal disorders (European Risk Observatory 2014). Increased demands for productivity in capitalist economies, increased global competition, technological advances, and changes in employment patterns, including the increasing role of precarious work and job insecurity, are placing increased pressure on workers (International Labour Organization 2016). Recent research across the globe indicates a significant issue, with an estimated 40 million workers in Europe reporting work stress (Eurofound 2007), and more than 65% of Americans reporting that work is a significant source of stress (American Psychological Association 2016). In the Asia Pacific, 70% of Chinese employees reported job strain, 61% of employees in Japan reported high levels of worry, anxiety, or stress at work, more than 31% of Korean workers reported that they experience stress at work, while in Australia, 19% of men and 28% of women reported being in high strain jobs (Kawakami et al. 2014). Global costs of work-related stress include costs to employers resulting from absenteeism and presenteeism, loss of productivity, health care costs, and social welfare costs in the form of disability benefit payments. Annual costs of work-related stress are estimated at €617 billion across the European Union, $285 to 634 billion in the United States, up to $11.7 billion in Canada, and $5.4 billion in Australia (European Risk Observatory 2014). Evidence shows that the incidence and severity of work-related stress is increasing (International Labour Organization 2016).

## Models of Workplace Stress

Early theoretical models of workplace stress typically begin with the design of the job to explain how work conditions affect psychological health. The most highly cited models examining the job design and impact on workplace stress are the job demands-control model (Karasek 1979), the job demands-control-support model (Johnson and Hall 1988), the effort-reward imbalance model (Siegrist 1996), the job demands-resources model (Demerouti et al. 2001), the demand-induced strain model (de Jonge and Dormann 2006), and psychosocial safety climate theory (Dollard and Bakker 2010).

The job demands-control model proposes that employees working in a high strain job combining high job demands and low job control experience the highest levels of workplace stress. Job control can moderate the negative effects of high demands on stress. This model was extended by adding the important role of social support. The expanded job demands-control-support model predicts the highest stress for workers when they experience high demands, low control, and low social support at work. Evidence for the models is usually found for the additive effects of job demands, job control, and social support on work stress although this relationship is more consistently supported in cross-sectional studies than in longitudinal data, and evidence for interactive effects is limited (Häusser et al. 2010).

More recently, the effort-reward imbalance model proposes that workers expend effort at work and expect rewards as part of a socially negotiated process. When an imbalance occurs between the level of effort and rewards obtained, work stress may develop. In this model, extrinsic efforts (job demands) and intrinsic efforts (over-commitment) are differentiated. Over-commitment is proposed to moderate or mediate the relationship between job demands and rewards. Most studies support the proposition that high effort and low reward creates higher levels of work stress particularly for workers with high levels of over-commitment (Van Vegchel et al. 2005).

The job demands-resources model combines a wider range of demands (e.g., work pressure, emotional demands) and resources (e.g., control, support, rewards, supervisor feedback) and proposes two processes: (1) poorly designed jobs or chronic job demands exhaust employees' mental and physical resources leading to workplace stress (health impairment process) and (2) workers with

high levels of job resources have high work engagement (motivational process). This model proposes that high demands require sufficient resources to offset the negative effects of the job demands.

The most recent model of work-related stress is the demand-induced strain model. This model is based on the triple match principle proposing that job demands, job resources, and job-related outcomes may contain cognitive, emotional, and physical dimensions where the strongest interactive relations between job demands and job resources are observed when demands, resources, and outcomes are based on similar dimensions (de Jonge and Dormann 2006). The triple match principle is a probabilistic principle, so while its effects are considered to be more likely, it is also anticipated that nonmatching effects will be evident; several studies show support for the principle (Van den Tooren et al. 2011). The practical interpretation is that to offset the negative effects of emotional demands resources in the emotional domain should be supported.

Psychosocial safety climate (PSC) theory, like the other theories, proposes that work stress is caused by poor quality work conditions but suggests that PSC is a leading indicator of these causes. PSC is therefore a precursor to other work stress theories (e.g., Owen et al. 2016). PSC reflects management philosophy and values in relation to worker psychological health and basic psychological needs and refers to the "organizational policies, practices, and procedures for the protection of worker psychological health and safety" (Dollard and Bakker 2010, p. 580). How management value and prioritize employee psychological health and well-being is reflected in four domains. These include senior management commitment to work stress prevention; management prioritization of worker psychological health over and above productivity outcomes; how policies and practices relating to stress management are communicated throughout the organization; and the level of active participation and involvement at all levels towards the protection of worker mental health. Despite its recent introduction there is significant evidence supporting PSC as an antecedent to a variety of stressors at work as well as their associated health, engagement and productivity outcomes. By measuring PSC, an organization can effectively predict levels of effort and rewards, job strain, bullying, and harassment (See Fig. 1 PSC model). Knowing levels of PSC can also indicate the probability of workers developing numerous health- and productivity-related outcomes including depression, anxiety, exhaustion, engagement, sickness absence, and presenteeism. Evidence further

**Stress Management, Fig. 1** Psychosocial safety climate stress model

suggests that the success of any initiatives to reduce work stress will in part be determined by the preexisting levels of PSC (Dollard and Bailey 2014).

## Stress Management at a National Level

Managing workplace stress involves addressing individual, managerial, and environmental factors that have a detrimental impact on employee health and well-being. Strategies that involve policy and practices for the prevention and management of work stress exist at various levels, such as national, state, industry, organizational, management, team, and/or individual.

Most developed countries and many emerging economies have established legislation to ensure an employers' duty of care to provide a safe workplace. In general, this states that employers are legally required to ensure an environment free from risk to worker health and safety, which includes psychological well-being. While these laws exist with the aim to protect workers from harm, they create a focus on punitive aspects, such as the costs of illness or injury caused by stress work. Prevention requires focusing more on the causal aspects within the working environment such as psychological and social (psychosocial) risk factors that can have an impact on employee health and productivity.

An evaluation of European policy and practice regarding mental health in the workplace found some persistent issues including a lack of clarity and specificity in terminology. Also, many of the available instruments do not provide explicit information on managing risks to enable organizations to implement effective preventative programs (Leka et al. 2014). While safe work regulators and governing bodies actively provide guidance to employers on a wide range of factors that can contribute to stress at work, there is often a lack of clarity regarding how these psychosocial aspects are to be adequately evaluated and/or how adherence to safe levels of exposure can be enforced. In order to protect worker psychological health and well-being, best practice states that psychosocial factors need to be regularly measured so that risks can be targeted for prevention and hazards can be identified for intervention (Houtman et al. 2007).

Many countries have implemented national surveillance programs measuring psychosocial risk factors at work across the population and use this information to develop evidence-based strategies aimed at improving work conditions. For example, the European Working Conditions Survey and the Australian Workplace Barometer (AWB) have collected national surveillance data on working conditions to inform national policy. Surveillance can also be used to evaluate the implementation of national-, state-, and industry-based initiatives. Countries have implemented frameworks to manage psychosocial risks such as the Management Standards (Health and Safety Executive, 2007), the Psychological Health and Safety Management System (Mental Health Commission of Canada, 2013), the START Procedure (Germany, 2009), Work Positive (Scotland and Ireland, 2002), and the International Labour Organization Checkpoints Stress Prevention Manual (Geneva, 2012) (Potter et al. 2016).

## Stress Management Within Organizations

The work stress literature demonstrates the need for organizational stress management to have a holistic approach that goes beyond a focus on the individual worker to address both the causes of stress and its consequences on the worker. Thus, initiatives to reduce and/or manage stress should encompass primary, secondary, and tertiary approaches with a specific focus on the causes of work stress. The basic classifications and targets of stress management interventions; the design, implementation, and evaluation of interventions; and best intervention practices are discussed in the following sections.

Within organizations, stress management refers to activities, programs, and opportunities which focus on reducing work-related stressors or assisting individuals to reduce the negative outcomes of exposure to stressors (Ivancevich et al. 1990). The management of occupational

stress is important to employees and to organizations, particularly senior management and human resource (HR) practitioners, who are concerned with effective practices that promote worker well-being. Determining the relationship between psychosocial work factors (organizational factors and interpersonal relationships that may affect the health of workers) and specific organizational outcomes assists management to determine where to focus resources. However, the literature on organizational stress management remains underdeveloped in terms of the theoretical foundations that explain how changes occur in work stress interventions (Biron and Karanika-Murray 2014). There are two major approaches to stress interventions. The first one distinguishes among primary, secondary, and tertiary interventions, whereas the second approach focuses on the target of those interventions which may be individual workers, the organization, or the interface between the organization and its workers. These approaches are not mutually exclusive, but emphasize different aspects of those interventions that address the causes of stress and/or its consequences on workers and the organization.

## Primary, Secondary, and Tertiary Approaches

Three distinct classes of prevention strategies are employed to reduce or manage work stress. Primary approaches are long-term approaches that aim to eliminate, reduce, or alter stressors at work (i.e., reduce workloads, increase workers' decision-making authority). Secondary strategies aim to reduce or eliminate the effects of stress in workers who are showing signs of stress before they lead to health problems. These strategies modify or change the stress response to inevitable/unchangeable demands and include relaxation training, meditation, and exercise. Tertiary approaches provide remedial support and treat workers with serious stress-related health issues by providing professional medical treatment or psychological counseling to heal specific problems. Notice in the PSC model that primary prevention is even further upstream than job design which is the intervention focus in other stress frameworks.

## Targets of Stress Management

Stress management may target the individual, the organization, or both. Individual (person-directed) approaches focus on specific employees or groups and aim to improve their coping resources in order for them to deal more effectively with demanding situations or modify their appraisal of a stressor to reduce its threat. Individual approaches include exercise, relaxation training, meditation, cognitive-behavioral therapy, time management training, cognitive coping strategies, and employee assistance programs (EAP). The majority of individual-directed stress interventions are secondary, reactive approaches that comprise stress management and coping techniques. While these interventions may have positive effects on psychological and/or organizational outcomes, their effects appear short-lived; therefore, they should be complementary to work and organizational approaches as the dominant view is that work stress and the resulting mental health outcomes are more strongly related to aspects of the work environment than to personal or biographical factors (Maslach and Schaufeli 1993).

Organizational (work-directed) approaches are classified as primary strategies as they intend to reduce the sources of stress. They are referred to as stressor reduction processes and include addressing job demands and job resources; improving communication, training, and education programs; increasing workers' participation and decision-making authority; improving organizational structure; and enhancing the physical environment (Giga et al. 2003).

Individual/organization interface-directed stress management focuses on the interplay between individual workers and the organization. At the team or group level, this includes setting up coworker support groups to improve relationships

at work, improve person-environment fit, address work roles, and increase worker participation and autonomy. Research asserts that combinations of organizational and individual intervention strategies can have positive effects in reducing exposure to psychosocial risks; however, there is still a tendency for organizations to select reactive, individual-level interventions, because it is cheaper and less disruptive to the status quo. Table 1 illustrates examples of individual and organizational intervention strategies and the level of prevention.

## Designing, Implementing, and Evaluating Stress Management

In considering stress management implementation, a three-phase model of design, implementation, and evaluation used in workplace health and safety interventions is important to consider (Goldenhar et al. 2001). The design phase aims to produce knowledge that can be used to develop appropriate stress management strategies to reduce the prevalence of psychosocial stressors. This phase involves a risk assessment to identify workers at risk and the specific risks that they are exposed to. This information is then translated into action plans to address the problem(s). The implementation phase evaluates the intervention implementation process by systematically documenting the strategies implemented. This phase describes what types of changes were implemented, the difficulties encountered, and the target population. The evaluation phase demonstrates whether the intervention was successful in reducing the prevalence of adverse work factors and illnesses by evaluating the effects of the intervention on the prevalence of psychosocial stressors in the workplace, and on objective measures such as the prevalence of mental health problems and sickness absences (see also Pignata et al. 2014).

## Stress Management Best Practice

Karanika-Murray et al. (2012) outline best practice in developing and implementing organizational stress management. First, stress management should include multilevels that combine individual- and organizational-directed approaches. The second factor is a participative approach to ensure that people affected by the intervention are actively involved so that the interventions are tailored to the work context and their needs, and the development should be supported by workers, union members, and senior management (Nytrø et al. 2000). The intervention literature demonstrates that factors such as organizational structure, size, resources, culture,

and values determine the appropriateness of interventions, and both the strategy and process of implementing an intervention may be as important as its content in achieving an effective outcome. As knowledge is dispersed in an organization at three levels: individual workers who create, store, and use knowledge; group knowledge which is a key asset within a company; and organizational knowledge with its own specific structure and divisions of functions, it is important that workers, line managers, and senior management participate in the development and implementation of interventions. It is critical that knowledge and communication is exchanged at all levels of the organization so that all employees are kept informed about the intervention process to ensure commitment and success.

A clear implementation framework is required that specifies the aim of the stress management, the implementation strategy, the role of all stakeholders, and what is to be done and how. The framework for a well-implemented stress management approach requires specific, achievable, and measurable objectives; clear allocation of roles and responsibilities; clear communication plans; and ongoing monitoring and documentation of the intervention processes to assist in explaining the impact and effectiveness of the stress management.

A strong evidence base and an assessment of the needs are required to ensure that the relevant issues are targeted by the intervention (Jordan et al. 2003). According to Biron et al. (2010), the risk assessment should include details of the symptoms, psychosocial risks, stakeholders' readiness to change, and perceptions of the intervention process so that any potential barriers or facilitators to its implementation can be monitored. Since work stress is attributed to a range of working conditions, in particular psychosocial factors at work, organizations, employers, and practitioners need to focus methods for prevention on causal aspects in order to be most effective. Just as national initiatives benefit from strategies that are evidence based, so will those implemented within organizations. Psychosocial risk assessment can be conducted by collecting data on the levels of risk in a workplace using risk assessment tools such as the Australian Workplace Barometer. Results for the organization can be compared to industry, state, and national benchmarks. In the absence of a risk assessment process, some organizations will use data such as incidence reports or injury claims; however, this does not necessarily capture workplace conditions from whence hazards originate. Focusing on more causal aspects will optimize stress management strategies and outcomes. Since PSC is a "cause of the causes" of work stress, the most effective stress management strategy will therefore include a PSC measure as part of the initial evidence gathering and risk assessment phase. PSC can be measured using the PSC-12 scale (Hall et al. 2010). To more easily assimilate the concept within organizational health and safety policy and practice, benchmarks have been created. Scores of 41 or above place workers at low risk whereas scores 37 or below place workers at high risk for deleterious outcomes such as job strain and symptoms of depression (Bailey et al. 2015). If an organizational psychosocial risk assessment indicates low levels of PSC and/or identifies other hazards, action plans to address the issues need to be developed, preferably in consultation with representation from those that are directly affected.

A final factor is the need for stakeholders to have clearly defined roles, be led by a coordinating group with widespread participation and consultation, with adequate support and commitment secured at both local and organizational levels (Lewis et al. 2012). The intervention's success depends on combining a bottom-up participative approach with a top-down approach that is supported by senior management, thus, management, line managers, and unions need to be committed to making actual changes to the workplace, and ensuring that those changes are communicated throughout the organization. For an example see Dollard and Gordon (2014).

It is important to note that these best practices are manifestations of the key principles or domains of PSC, and when stress management is implemented along these lines, that PSC within organizations will increase. The PSC hierarchy of control (HOC) is a practical tool designed to assist safety practitioners and employers with managing

psychosocial hazards once they have been identified. It follows the underlying concepts captured by PSC and directs focus to the four PSC domains (organizational communication and participation, management priority and commitment). The PSC HOC breaks down each level to provide clarity, prompting communication and shared understanding when addressing these psychological and social issues. The hierarchy can be used to address low levels of PSC directly, or any other identified psychosocial hazard (Dollard and Bailey 2014).

## Conclusion

As a basic human right, organizations should provide work environments that are healthy places to work in and jobs that are designed to promote psychological health. Stress management is required in many workplaces and needs to be properly developed, implemented, and evaluated. Approaches should be participatory and involve and be supported by workers, unions, and senior management. Stress management should be multilevel (primary, secondary, tertiary) and combine individual and organizational-directed approaches. Stress management should be implemented to emphasize empowerment, worker involvement, and involve strategies that are tailored to meet the needs of the participants and the work context. Finally, stress management should have clearly defined risk assessment/monitoring components and be widely promoted throughout the organization, and evaluation should use multiple self-report and objective measures. If all of these objectives are achieved, the psychosocial safety climate of the organization should improve.

# Stress of Vietnamese Working Adults

Quan H. N. Tran
School of Economics and Business Administration, Tartu University, Tartu, Estonia

## Synonyms

Occupational stress; Overload stress; Stress orientation

## Introduction

For such a long time, researchers have conducted many pieces of literature concerning stress (LePine et al. 2004; Shoaib et al. 2019; Tsai et al. 2009; Coetzee and De Villiers 2010). The findings highlighted that a high level of stress leads to several negative consequences, including employee's dissatisfaction, low commitment to organizations, and increased work–family

conflict. Stress is regarded as a root of psychical health issues in the working group (LePine et al. 2004; Shoaib et al. 2019). As a result, psychical health problems can lead to decreased employee's satisfaction, increased group tension, and work–family dispute (Tsai et al. 2009; Coetzee and De Villiers 2010). Thereby, it is necessary to investigate the implication of stress and its effects on organizations. Though several studies have researched multiple aspects of stress on organizational context, the majority of them have been only conducted in the Western context. As a result, its implication on the Asian context is questionable. Therefore, this study aims to fill this gap by examining whether the demographics as age, gender, and working experience have associations with stress. The findings showed that all demographics do not have any significant relationships with stress.

## Theoretical and Literature Grounding

### Vietnam and the Culture

The Socialist Republic of Vietnam is one of the countries in South-eastern Asian region. Its population is approximately 97 million people, of which more substantial than a half are from 15 to 64 years of age (69.3%). There are 58 provinces and 5 megacities including Hanoi (the capital) and Hai Phong in the North, Da Nang in the middle, and Ho Chi Minh and Can Tho in the south. Vietnamese is the universal language, whereas English and Chinese are officially considered as the second and third language. The Vietnamese government is referred to a communist party (Central Intelligence Agency 2014).

Vietnam has mixed and multiple cultures, which was shaped for a thousand years (Nguyen et al. 2012; Tran 2019a). The nation has a history colonized by Asian and Western countries such as China, Japan, France, and America, so Vietnam culture is a blend of cultures of these countries. As such, the country culture is regarded as power distance, collectivism, average uncertainty avoidance, and low masculinity (Quang and Vuong 2002; Ralston et al. 2006; Tran 2020).

### Occupational Stress

Occupational stress has been investigated in many studies over decades (Kottler and Chen 2008; Tsai et al. 2009). Several authors believed that stress is regarded as the main reason leading to employee's dissatisfaction, absenteeism, and low working efficiency (Shoaib et al. 2019; De Bruin and Taylor 2006). Stress is also considered as a psychological problem that needs to be solved (Kottler and Chen 2008). Stress could be divided into short-term and long-term types (Sikander et al. 2012). The former does not harm the individual's psychology seriously as it only happens in sudden accidents or risks. By contrast, the latter has a long detrimental effect on an individual over time as long-term stress could occur as a risk or threat happening in a long time. In detail, long-term stress often links to daily issues such as task difficulties, job changes, and work–family dispute.

Stress among working people has been a well-known topic for investigation in various literature across decades. Every employee experiences stress through daily tasks (Iqbal and Kokash 2011). Individuals regard causes of stress for organizations, and these stressors relate to overload tasks, financial difficulties, time management, and work–family conflict as they must find a way to balance work and family life. Nguyen and Mujtaba (2011) showed that Vietnamese adult people experience highly overload stress among all respondents.

The different aspects of stress on gender and age has been researched in many kinds of literature, and the results were diverse. Tajaddini and Mujtaba (2011) highlighted that Iranian male experience a higher level of stress than female, whereas German respondents cannot find any differences (Nguyen et al. 2012). In Iran, men and women have separated duties in the family and cause stress from different reasons. The stress for Iranian female mainly comes from personal health and family issues, whereas Iranian male has various causes of stress, such as job pressures, finances, personal health, and relationships. Also, Nguyen et al. (2012) showed that Germans who have more working experiences have a higher level of stress than those who have less

working experiences. By contrast, the study of Nguyen et al. (2014) highlighted not any differences within Dutch respondents. Altogether, an individual category of stress can be labeled as low, average, high, and none. The occupational stress, adapted from the study of House et al. (1979), can be selected to evaluate the level of stress among respondents. This questionnaire has 15 items, and for each item, the participant experiences a level of stress.

The detail hypotheses for this research are as follows:

- *Hypothesis 1:* There is a significant divergence in the stress score within the age of Vietnamese respondents.
- *Hypothesis 2:* There is a significant divergence in the stress score within the gender of Vietnamese respondents.
- *Hypothesis 3:* There is a significant divergence in the stress score within the working experiences of Vietnamese respondents.
- *Hypothesis 4:* There is significant interaction between gender and age in the stress score.
- *Hypothesis 5:* There is significant interaction between gender and working experiences in the stress score.
- *Hypothesis 6:* There is significant interaction between working experiences and age in the stress score.

## Methodology

The questionnaire has been sent to working adults in many enterprises of the two biggest and wealthiest cities of Vietnam, naming Hanoi and Ho Chi Minh. Hanoi city is the capital of Vietnam and is regarded as the oldest area with the history of thousands of years. As a politically central area in Vietnam, the majority of the population have worked in public sectors. However, the tendency has been moving as people are looking for jobs in private enterprises as well. With the history of being colonized by America for a few decades, Ho Chi Minh city is the largest, wealthiest, and most developing city in Vietnam. It also has a remarkable economy as the majority of service and manufacturing enterprises exist here with a range line of trade, production, sale, and marketing. People in here are dynamic, creative, and career-oriented.

**Stress of Vietnamese Working Adults, Table 1** Descriptive characteristic ($N = 276$)

| Background information | Frequency | Percentage |
|---|---|---|
| Age | | |
| 18–29 years old | 113 | 40.9% |
| 30–39 years old | 112 | 40.5% |
| 40–49 years old | 44 | 15.9% |
| Above 50 years old | 7 | 2.7% |
| Gender | | |
| Male | 134 | 48.2% |
| Female | 142 | 51.8% |
| Working experiences | | |
| Below 1 year | 23 | 8.3% |
| 1–10 years | 204 | 73.4% |
| 11–20 years | 43 | 15.5 |
| Above 20 years | 6 | 2.2% |

In the preceding two cities, several 500 questionnaires were collected from respondents. From the returned questionnaires, 224 surveys missed items and removed from the research. As a result, 276 surveys (55.2%) were selected for the final analysis. Demographic traits are an important index of many stressful results; thereby, they are analyzed by the scholar to define stress (Barbuto et al. 2007). The detailed demographical characteristic is displayed in Table 1.

For the reliability testing, the Cronbach alpha is required to be higher than 0.6 to guarantee the rationality of the factor loadings. As a consequence, Cronbach's scores of occupational stress are 0.841. These results indicate that the survey is acceptable in social science research.

## Results

As displayed in Table 2, there are no significant differences within gender (F = 0.298, $p = 0.827$), age (F = 0.799, $p = 0.372$), and working experiences (F = 0.353, $p = 787$). Thereby, hypotheses 1, 2, and 3 cannot be supported. Table 2 also indicates no significant correlations among age

**Stress of Vietnamese Working Adults, Table 2** Tests of between-subjects' effects

| Error | 499.929 | 254 | 1.968 | | | | | |
| Total | 15568.7 | 274 | | | | | | |
| Corrected total | 517.621 | 273 | | | | | | |

[a]R squared = 0.034 (Adjusted R squared = −0.038)

and gender (F = 0.140, $p$ = 0.936), age and working experiences (F = 0.770, $p$ = 0.545), and gender and working experiences (F = 0.564, $p$ = 0.639). As such, hypotheses 4, 5, and 6 cannot be supported.

A proficient way to comprehend the divergence in independent variables or a correlation between variables is to test the observed power. As Table 2 pointed out, there would only be 10.7%, 14.5%, and 11.9% to find out statistical differences in mean scores for age, gender, and working experiences, respectively. Similarly, there would be 7.5%, 24.6%, and 16.6% chances of looking for significant interaction between age and gender, age and working experiences, and gender and working experiences on stress results, respectively.

## Discussion, Limitations, and Recommendations

In this research, the three demographic components of age, gender, and working experiences are investigated to explore their role in shaping stress. However, this research cannot explore significant divergences in stress scores based on these variables. The research also does not find out interactions between age and gender, age and working backgrounds, and gender and working experiences in stress. The data results conclude that stress cannot be defined by a single component or the combination of components. Vietnam like China and Japan has a collectivist culture where individual's behavior and personality are structured in conjunction with conventional and relationship factors, where people are forced to behave socially and responsibly (Hofstede 2012; Tran 2019b). Altogether, this study is the first exploration challenging the associations among gender, age, working experience, and stress in Vietnam.

All research exist within its limitations, and the scholar acknowledges that occupational stress is well-known constructs in the Western context, but its implication in South-East Asian context is questionable. Thereby, this study adds some values to this topic in Vietnam. Further research might compare stress in Vietnam and other South-East Asian countries. In addition, as the author does not find out any differences in stress in terms of age, gender, and working experiences as well as their interactions, further studies might continue to explore their differences.

## Definitions

- *Stress* can be anything of uncertainty to which the body reacts either in a positive manner (eustress) or negative manner (distress).
- *Perceived stress* is a condition subjectively experienced by respondents who ascertain a disparity between demands placed on them and the resources available to them to meet those demands.
- *Qualitative overload* refers to the tasks and responsibilities given to an employee beyond

his abilities, without adequate training or skill building to get it done effectively. *Quantitative overload* refers to additional responsibilities given to a person, without adequate time, to get them done in a preferable way.

- *Role overload* is the conflict of priorities resulting from expectations that a person performs a wide variety of tasks, which are impossible to complete within the given time limits.

## Introduction

The culture of a society has a strong impact on the organizational culture and stress of employees. Culture is defined by Geert Hofstede (2011) as a collective programming of the mind that differentiates members of one group of people from others. Hofstede (1981) has described culture as "the software of mind," which guides people. Cultural messages refer to the information shared by members of the in-group, and often the out-group members are unaware of it as they are not within that circle (LeBaron 2003). Culture plays an important role in the development of human thoughts and behavior. Ignoring cultural differences in an interaction can potentially signal trouble. Organizations that overlook the salient features of culture may sooner or later find themselves in trouble regarding communication, particularly when they are working as expatriates. Culture shapes our perceptions of almost everything in a society and unconsciously affects our daily lives by shaping our beliefs, thoughts, and convictions. Two things are essential features of any culture: cultures are dynamic, and they relate to the symbolic dimension of life (LeBaron 2003). LeBaron refers to the symbolic dimension as a phenomenon where individuals constantly give meanings to things, endorsing their identities. Societal cultures exist in the values of individuals in an unconscious manner, and it encompasses the broad tendencies of preferences of certain states of affairs over others. On the other hand, organizational cultures reside in a conscious way and can be seen from the practices of individuals that are reflective of their perceptions, of what goes on, in their organizational environment (Kahn et al. 1964).

A study by Kuhn in 1970 on the cultural paradigms inspired a number of other studies into the various dimensions of national culture. Some authors stress that culture is the consequence of finding a way out of problems, with the environment, time, and relationships. Globalization and workforce mobilization have influenced many researchers to conduct intercultural studies. Kagitcibasi and Berry (1989) are also of the opinion that there is a need to understand cultural differences as the world is shrinking and businesses are becoming less Western-oriented. In the absence of having an inclusive work environment for people of diverse cultures, employees might feel overly stressed, and consequently their work performance might suffer.

## Stress Perception and Performance

Extensive and diverse literature exists on the relationship between stress and performance. Kavanagh defined stress as a nonspecific response of the body to a stimulus or event (stressor). When an individual encounters a stressor, it will result in either psychological or physiological response of the body. Consequently, a psychological response is manifested in the form of stress, and if physical, it may be in the form of physiological changes in the body. There is increasing evidence of work stress, resulting in negative health outcomes, both psychological and physiological (Offermann and Hellmann 1996). Stress may be defined as a physiological response of the body to demands made upon it (Tajaddini and Mujtaba 2009). Stress can be anything to which the body reacts either in a positive manner (eustress) or negative manner. Matteson and Ivancevich (1987) refer to stress as an adaptive response that is moderated by differences in each person. Stress can be the consequence of any action, situation, or event that places undue demands or hardships upon an individual. The most popular accepted concept of stress is that there is at least one stressor (which can be anything) that triggers off or has a response to (stress) either eustress or distress (Selye 1956). Stress is a response to any outside force – the

stressor, which refers to any problem or concern an individual has to deal with in life.

Job stress may come from five major sources: task overload, uncertainty of what will happen, understaffing, lack of sufficient experience for the job, and personal problems (Teratanvat and Kleiner 2001). Stressors in the workplace are those conditions that have the potential to result in a person experiencing a situation as stressful. The degree of stress experienced and the ways in which a person reacts to it can be influenced by a number of other factors, such as personal characteristics, lifestyle, social support, and appraisal of the stressor, life events, and sociodemographic and occupational variables. Indicators, such as role ambiguity, work-life balance, workload, lack of leader or manager support, rewards, tools and equipment, job aspects, job security, lack of autonomy at workplace, and career advancement could be the potential stressors and may have an impact on employees' well-being and engagement in the workplace. All stressors tend to produce similar physiological responses within the body.

Stress is perceived only when the brain triggers a response to the stressor. Stressors can be any event – internal or external stimuli – which is perceived unacceptable or threatening by the mind; whereas, perception is the interpretation of those stimuli. If the stimulus is interpreted as threatening by the brain, it will result in stress; otherwise it will eventually adapt to that stimuli in a period of time. Stress can be all those feelings and perceptions in lack of time, ability, skill, or resources to effectively deal with personal or professional demands in a given time. Stress is all those real and perceived forces that encroach or are imposed on the individual. Perceived stress has been defined as a condition subjectively experienced by respondents who ascertain a disparity between demands placed on them and the resources available to them to meet those demands.

## Task Overload and Workplace Stress

Occupational stress is a harmful physical and emotional response incurred in the work environment due to the shift in the nature of jobs from manufacturing to service industries. Both physiological and emotional demands of work and workplace have increased, which often result to burnout. Research has indicated that the most common sources of job stress could be expected to have a significant impact on organizational activity and employees' sense of well-being and engagement in the workplace. The author defines workplace stress as a condition arising from the interaction of people and their jobs, which is characterized by changes within people that force them to deviate from their normal functioning.

Among other variables work overload has been identified as a major cause of stress. Workload refers to the amount of stress experienced by individuals due to the perception that they are unable to cope or be productive with the amount of work allocated to them. The authors assert that when individuals are expected to do more than the time and resources available permit them to do, they are likely to experience strain. Coetzer and Rothmann (2007) found that good relationships with the supervisors and leaders improve employees' satisfaction level and reduce work-related stress, while work overload results in employee frustration and increases their stress level. Work overload drains an employee's energy and results in mental exhaustion. If mental exhaustion exceeds a certain level, it can be converted into "burnout," thus, negatively affecting employees' performance.

Stress overload can be qualitative or quantitative (Hyde and Allen 1996). Qualitative overload refers to the tasks and responsibilities given to an employee beyond his abilities, without adequate training or skill building to get it done effectively. Quantitative overload refers to additional responsibilities given to a person, without adequate time, to get them done in a preferable way. Role overload is the conflict of priorities resulting from expectations that a person performs a wide variety of tasks, which are impossible to complete within the given time limits. Nelson (2003) conducted a survey, which indicates that 41% of the people cite workload issues

as the biggest source of stress, which may lead to lower job performance, resentment of supervision, boredom, low self-esteem, inability to concentrate and make decisions, apathy, short attention span, burnout, and job dissatisfaction. Stress can be a main contributor to performance decrements. In the presence of stressors, the time given for task completion is doubled. Stress that is created due to task overload reduces the quality of individual performance and increases the magnitude of the performance decrement as compared with the case in which the individual has only one task to perform.

Job demands, such as workload, exhaust the employee's energy, and in an attempt to cope with the resulting exhaustion, the employee withdraws mentally, decreasing their work engagement levels. Moreover, job demands can lead to burnout, which will in turn adversely impact an employee's engagement. Some of the adverse implications of stress are inferior quality of work, low productivity, and high absenteeism and turnover. Job resources, such as advancement, social support, organizational support (including relationship with superiors, role clarity, information, communication, and participation), and growth opportunities (including variety, opportunities to learn, and autonomy), are positively related to work engagement, whereas job demands, such as work overload, are negatively related to work engagement (Coetzer and Rothmann 2007). Mujtaba and McCartney (2007) differentiated between eustress and distress; the former is linked to good or positive things that happen, whereas the latter is linked to negative things. Stress, no matter by what name researchers refer to it, will always have an effect on employee performance. The authors of this study maintain that not all stressors are bad; some may be good, and it may still evoke a bad response.

These days all adults are surrounded by so many different factors, particularly at work, some of which include conflict, change, and stress. While it is not possible to control all the factors that cause stress, these can be controlled and managed properly to have a productive workplace.

## Task Overload in Employees

Stress is a term commonly used to describe feelings of tensions or exhaustion usually associated with work overload or overly demanding work (Sikander et al. 2012). Several stressors have been identified in the workplace, such as role ambiguity, work-life balance, task overload, lack of leader or manager support, rewards, tools and equipment, job aspects, job security, lack of autonomy at workplace, and career advancement that could cause potential stress and can affect employees' performance. Defines workplace stress as the condition arising from the interaction of people and their jobs, which is characterized by changes within people that force them to deviate from their normal functioning. Organizational stress is considered one of the criteria of organizational performance effectiveness. The manifestation of workplace stress can be seen in the form of inferior quality of work, low productivity, high absenteeism, high accident rate, low morale, and high turnover. Task overload can decrease motivation toward learning and work performance. Individuals react to different stressors in different ways, depending upon their personality traits and emotional intelligence. High task orientation coupled with a Type A personality can be a higher potential for stress, particularly in those individuals who do not maintain a balance between their personal and professional lives. Thus, all stressors have the potential to produce stress, but the level of stress perceived and the type of stress vary among individuals. Individual differences may cause some to interpret these stressors as positive stress or "eustress" (which stimulate them), while others experience negative stress or distress (which detracts from their efforts). Eustress can be referred to an experience that is psychologically healthy, and as a consequence, it promotes cognitive and behavioral performance, while distress is referred to an experience that is bodily and psychologically unhealthy and leads to a loss of productivity.

Stress can be either long-term or short-term. The former usually does not cause any serious physical or psychological problems; in fact it

keeps the body and mind active. The authors consider long-term stress to be detrimental and can cause psychological and physiological breakdown. Stress can be calibrated as low, moderate, high, and severe, but whatever the degree, it is important to be cognizant of the fact that consistently overloading oneself can be problematic.

## Conclusion

The study has provided an insight into the stress perception of employees due to task overload in a high-context culture.

Generally speaking, the fact that there is no difference in the level of stress perception of the male and female employees is interesting. Although, females are physically smaller to their male counterpart, however, when it comes to workplace, this difference seems to be leveled out. This is a good indication of evidence that females can be equal professionals when it comes to handling stress in the modern South Asian workplaces. The stereotype that female employees are unable to handle workplace stress is busted with empirical testing in different cultures. Moreover, this can also help in shattering the glass ceiling effect, which is very dominant in most South Asian countries and neighboring regions, hampering the upward movement of female employees in organizations. Managers should thus focus on the capabilities of the candidates rather than worry about their biological differences.

The workforce these days has become more diversified in terms of culture and demographics. Understanding the phenomenon of stress using these diversities will equip managers for proactive approaches toward managing it before becoming a distress for the employees. The current study hence provides real-world implications and recommendations for managers and practitioners for dealing with workplace stress of multitasking employees and employees facing overload.

Identification of stressors and responding to them in a proactive manner will have a positive effect on the organization's bottom line. As confirmed by and aligned with previous studies (Nichols 2008), this chapter emphasized that the impact of stress can be physical, emotional, mental, and behavioral. Moreover, its intensity can be low, moderate, or high and in worst case even burnout.

Studies on stress have confirmed that when employees encounter a stressor for a prolonged period of time, it will result in some sort of psychological or physiological response from the body, resulting in negative psychological and physiological outcomes for employees in the workplace. In terms of gender, the authors found no significant differences in stress level between males and females in South Asia, which were in conformity with the study findings of Afza et al. (2011) and Huang and Mujtaba (2010) but contrary to what Matud (2004) as well as Pines and Zaidman (2003) have reported. The workforce demographics over the last couple of decades have drastically changed, witnessing increased female employment and diverse workforce.

Moreover, with respect to age and qualification, the literature on stress contains mixed results. Young employees have more avenues to deal with stressful situations and are more energetic than the older employees. In an era of knowledge economy, access to and usage of web sources makes an individual resourceful. The younger employees are more resourceful in this regard, making them less prone to stress. Moreover, the level of stress increases even when an employee's qualification becomes higher, as people expect more, both in terms of quantity and quality of work, from those who are more qualified, which in turn may increase their level of stress.

# Structure and Reform of Local Government in Ireland

Petros B. Ogbazghi
Department of Public Administration, University of Asmara, Asmara, Eritrea

## Synonyms

Ireland; Local administration; Local authority; Local government; Local government reform

## Definition

Local government is generally defined as a sub-national government, comprising a complex set of democratically elected local councils and representative authorities that are created by constitutional or statutory parliamentary provisions for the purpose of providing and administering social services to the inhabitants of a particular local area or district, with a degree of autonomy and structural independence from the central government.

The concept of local government reform refers to the introduction of a comprehensive or incremental set of structural, institutional, attitudinal, and organizational strategic changes that are aimed at transforming, modernizing, and adapting the local government system to local social, cultural, political, economic, and environmental needs through the effective, efficient, and sustainable use of resources.

## Introduction

The immediate pre-independence Local Government (Ireland) Act, 1898 and the corollary events at the local level had far-reaching implications in terms, not only in establishing representative and democratic local government institutions for the first time but also played a significant role in the expression of brooding national identity and the local solidarity networks needed to realize

national sovereignty. When Ireland achieved its independence and *Sinn Fein* came to power in 1922, the new leaders drafted a new constitution, which closely mirrored the Westminster model of parliamentary democracy, where the executive arm of government was made up of the party that won majority in parliament. Similarly, they adopted a national macroeconomic plan that emphasized the crucial role of the state in the socio-economic transformation of Ireland.

The heavy stress placed on high state intervention was legitimated on ideological grounds that independence would enable Ireland to effectively control and manage its national resources and achieve a level of economic development that would make it possible to achieve domestic equity. To this end, the government intervened heavily in economic and social life of the newly founded nation by undertaking major projects related to the establishment of local hospitals, schools, road maintenance and construction, and other social infrastructures. Despite the transfer of power from London to Dublin, the new leaders were, however, reluctant to abrogate the political and institutional arrangements inherited by the British. As such, state institutions, in general, and the local government system, in particular, evolved in a context where there were no marked structural reforms to reflect the new political reality of independence.

## Local Government Reform in the Immediate Post-independence Period

At the local level incidents of corruption, jobbery, parochialism, and nepotism were so widespread that it evinced so much apathy on the part of *Sinn Fein* leaders who responded in somewhat drastic fashion. The measures they introduced had two components: increasing the level of local government centralization, while at the same time decreasing the number of local government units both at county and subcounty levels. Thus, for example, the introduction of the Local Government (Temporary Provisions) Act, 1923 saw the dissolution of 36 local authorities, including, 4 county councils and Dublin and Cork Corporations in the 8 years from 1923 to 1931 (Daly 2002, p. 75). Moreover, local government representation was abolished in many regions only to be replaced by what came to be known as local commissions.

Similarly, the second half of the 1920s witnessed some reforms, specifically, the introduction of the Local Government (County Boroughs and Adjustments) Act, 1926, which established the Local Appointments Commission (the equivalent of civil service administration at the national level), which sought to remedy corruption and endemic abuse of power in local government appointment practices. The new arrangements led to a more efficient and more accountable administrative system but this was achieved at the expense of local autonomy. Ironically, these developments led to a situation where councilors and backbench TDs began to complain about the growth of bureaucracy and the increase in central control in the same way the Boards of the Poor Law Guardians felt against the British who exerted stringent control from Dublin Castle (Daly 2002, p. 76).

Corollary reforms during this period related to the introduction of the County Manager system – a new genre of local government system, which originated in the United States and was practically unknown to Ireland and indeed to Europe in general. This landmark management-centered reform, which was implemented on a much greater scale by subsequent governments, was aimed to promote the effective and efficient coordination and execution of overall policy directives by appointed county managers, hitherto the prerogative of elected county boroughs and county councils. It had the secondary effect of undermining local self-government and the autonomy of elected representatives.

## Local Government Reform: 1930s–1940s

Enter the subsequent government of the *Fianna Fail*, local government reforms drastically curtailed even the limited powers that local governments had enjoyed in the aftermath of independence. In what came to hold true to what many had predicted that *Sinn Fein's* reform

measures would set a precedent on how future policy reformers would respond to prevalent cases of administrative inefficiency, between 1932 and 1942, *Fianna Fail* leaders abolished six county councils, with some even calling for the elimination of local government units altogether. Thus, for example, in 1933 Sean T.O. Kelly, the Minister for Local Government and Public Health, notified cabinet that local government councils had become "an expensive anachronism" and called for their abolishment (Chubb 1970, p. 271). Although the cabinet did not agree, the result was that local governments appeared to be subjected under much closer central control than they were under the Local Government Board or even during the immediate post-independence period.

Such drastic albeit negative policy attitudes and responses toward local governments had to be justified on ideological grounds in which local governments were insisted to have been the creation of the British with little or no meaningful context in the Irish Free State. Such cognitions unsurprisingly unleashed subsequent reforms that tended to centralize power at the national government level. But there were also pragmatic reasons that explain why the central government was too shy to vest more power on elected councilors than on a centrally appointed local manager, such as the need to stave off corruption and nepotism.

During the 1940s, however, the *Fianna Fail* government introduced a system of city management, which continued to prevail to this day. This particular reform was aimed at addressing the administrative shortcomings in the implementation and execution of local government policies, which, hitherto, were the prerogatives of the county boroughs and county councils. These so-called management reforms, which actually began in 1926, introduced the appointment of professional managers at the local level. Under this new management system (which by 1942 came to be fully implemented across the broad spectrum of local governments), responsibility for major executive decisions, including local government housing allocation and appointments to most junior offices, was transferred to the "County Manager." Senior posts, however, continued to be filled by the "Local Appointments Commission," which was in place since 1926.

Other local reforms during this period relate to the establishment of local development bodies known as County Development Teams. The objective of these local bodies was to articulate and coordinate development activities with the overall local government goals and priorities. Albeit innovative, the impact of the reform was shallow at best as their activities were bypassed by newly emerged state-sponsored bodies. Policy implementation now came to be nested with a variety of newly set up agencies, which operated parallel to local governments. The result was that the new arrangements not only undermined the democratic decision-making discretion of local governments but also fundamentally altered the role of local governments as agents of development. Ancillary reforms during this period saw the introduction of what came to be referred as Planning Programming Budgeting (PPB) systems that sought to restructure the hitherto rudimentary budgeting procedures. The goal was to integrate the overall local government budgets with specific department objectives and activities to which performance could be reasonably measured and attributed.

## Local Government Reforms of the 1960s–1980s

Yet another major reform area that sought to make up for the loss of local authority decision-making powers by enabling them exert greater control in the area planning, thereby allowing them initiate major development activities came with the Local Government (Planning and Development) Act, 1963. This reform was augmented by the establishment of nine planning regions in 1964 and the setting up of a commission in 1968 following what came to be known as the Buchanan Report on regions. With this reform in place, local authorities were now able to embark upon major infrastructure activities, including local government housing development as well as the construction of roads. As it appeared from the policy pronouncements, the ultimate goal of the 1963

reform was to align local goals with the national ones, which aimed at deregulation and opening up of the economy in a bid to attract foreign investment. Moreover, in order to realize equitable regional economic development, new investment firms were encouraged and sometimes forced to locate in peripheral regions.

The central government subsequently established regional coordinating agencies that were responsible to Dublin. However, although these so-called Regional Development Organizations that were created at the end of the 1960s (only to be abolished in the 1980s) were non-statutory bodies, they were strictly controlled by the central government, which granted them the consent to function at the local level. With scarcely adequate resources and less reliable or meaningful linkage with the local government bodies, local government activities both at the county and subcounty levels appeared to have been neither coordinated nor generated popular support to realize the much sought-after regional economic policy. With the reforms of the 1960s and the 1970s, some results were achieved in the way of reversing the highly top-down approaches. Such success during this period, which also coincided with the frequent postponement of local elections – a practice that survived long into the early 1990s – was, however, shallow as the reforms fell short of putting in place more decentralized and autonomous local government structures, nor were local authorities uniquely oriented to tackle regional imbalances for which the reforms were intended.

Other local reform issues that were not resolved during this period relate to finance. Indeed, prior and long after the reforms, the local government units – both county and city councils – remained ever dependent on the central government for transfer of funds: a situation which later triggered the introduction of what came to be known as development levies. This latter reform was aimed at enhancing local revenues by making up the shortfalls in the form of service charges. The discretionary powers of local governments in allocating resources they deem appropriate only applied in principle as local governments were subjected to strict financial scrutiny. In fact, the level of central control was so striking that even Dublin – the capital city with metropolitan responsibilities – was doubly irked that it had to run its affairs within the same local political framework, which neither encouraged organizational innovation nor helped mobilize the necessary resources (Bannon 2007, p. 224). Of course, the reforms did stipulate that local governments could raise their own revenues by directly participating in the market. On the ground, however, they largely depended upon direct government transfers as well as what later on came to be known as the Local Loan Funds. Especially from 1977 onward, with the abolishment of property tax, local government revenue further dwindled and what hitherto could fund local services through locally raised revenues came to shrink, diminishing with it too the limited discretion that local revenues bestowed. Prior to the abolishment of the property tax, local rates and central government grants represented about 40% and 43%, respectively (Komito 1985, p. 40). Local government rates from now on would continue to drop to mere 21%, while central government grants hiked to 61% (Chubb 1982, p. 298). Even then, the central government continued to determine the rate and base of local taxes. This drastically drained the limited fiscal autonomy that local governments had in terms of budgetary and revenue decisions, which had now been arrogated by the central government which instructs them in relation to how much money they could raise, how it was going to be spent, and what amount was needed from the coffers of central government.

## Local Government Reforms from the 1990s to the Present

Prior to 1991, Irish local authorities were constrained by the doctrine of ultra vires and were considered to be acting outside their powers if they performed any functions not specified in law. However, with the Local Government Act, 1991, local authorities were granted a general competence power to carry out general actions aimed at promoting the social, economic, and

community development of their jurisdiction. Similarly, following the Local Government Act, 1998, local authorities' financial position was substantially enhanced through a combination of two parallel fiscal sources: a centrally controlled and funded local transfers and motor tax proceeds. It was also during the 1990s that reforms known as Financial Management Systems were introduced. The objective was to reform the overall management of funds, including the introduction of accounting procedures, such as accruals, asset valuation, balance sheet, financial performance indicators, and cost accounting and auditing procedures. Much of the financial and budgeting reforms, however, proved unsustainable as they were severely constrained by internal administrative bottlenecks. These challenges pertained to the lack of highly skilled staff that could be available across the broad spectrum of local government in implementing and responding in accordance with the hitherto introduced institutional and financial reforms.

What is perhaps remarkable in terms of the reform agenda it prescribed and attempted to implement came under the "Better Local Government Act, 1996." This ambitious and more complex piece of legislation sought to enhance the policy-making role of local councilors, and it tried to achieve this by shifting attention externally toward community groups by developing more community-local authority linkages and by strengthening and empowering local communities to take active role in local governance. With the 1940s managerial reforms already serving as the forerunner, the local government reforms of the 1996 were attuned by more managerial ethos, which led to the setting up of auxiliary policy actors, referred to as Corporate Policy Groups (CPG). These newly established local government bodies, which were made up of both community groups as well as elected representatives were tasked with the provision of overall policy direction and coordination – under the guidance of local councilors – to specialized teams of policy subcommittees known as Strategic Policy Committees (SPC). The latter were, in turn, responsible for the formulation, implementation, and overall steering of their specific sectoral policies.

Following the Local Government Reform Act, 2014, currently, the local government system of Ireland comprises a total of 31 local authorities, which represents a marked reduction from an initial total of 114 local authorities. They are structured on a two tier system: whereas 26 county

**Structure and Reform of Local Government in Ireland, Fig. 1** The current structure of local government in Ireland

councils, 3 city councils, and 2 city and county councils constitute the upper tier, 95 municipal districts (of which 3 are designated as metropolitan districts, while another 4 areas are known as borough districts) as the lower tier. The county and city councils, which continue to operate under elected local councilors, remain the nuclei of local political power and decision-making and are responsible for the provision of a relatively wide range of local services, including housing, road maintenance and safety, sanitation, water supply and sewerage, as well as environmental protection, sport and recreational amenities, and cultural heritage services. Unlike the local government units of many EC member states, however, responsibility for the provision of services in the areas of health, education, policing, and social welfare lies within the ambit of the central government (Fig. 1).

## Conclusion

When Ireland achieved its independence and set up a new government, its leaders intervened heavily in the economic and social life of the nascent state, which tended to gravitate toward highly centralized, hierarchical, and tightly controlled institutions. Indeed, the inherited local and national institutional forms continued to define the context within which the state and its institutions had evolved. Thus, the political landscape was shaped by a centralist tradition of decision-making and administration inherited by the British. Similarly, the pre-independence local government units were plagued by a deep-seated administrative malaise, which continued in the post-independence period to be a breeding ground for corruption, clientelism, and patronage of public office, especially in areas of recruitment and selection. These factors induced generations of Irish policy makers to embrace a more centralized approach to local government where the suspension or abolition of local councils was judged to be an acceptable and even a desirable option. Although this apathy was largely the result of the tortuous history of malfunctioning of local governments, ideological and political cultural factors, including attitudes of mistrust toward local councilors, could also be seen to have played an important role.

It was within these inherited cultural and structural political frameworks that consecutive Irish governments continued to embark upon what could be labeled as a litany of local government reforms. Despite strong emphasis on local elections and local democratic representation, in practice, however, the bulk of the reforms continued to erode local autonomy. This resulted in drastically curtailing the political autonomy of local councilors in policy-making and implementation. Especially, ever since the introduction of the county manager system, which was heavily influenced by the imperatives of efficiency and standardization in local service provision, local decision-making powers came to be vested in the hands of appointed professional managers, who were ultimately responsible to the central government rather than to elected local councilors. In the past, the impact of EU's regional and multilevel governance approaches, which Ireland enthusiastically adopted, seemed to have helped the government experiment with a far more innovative and effective approaches to local government. In more recent times, however, despite a more critical domestic public opinion and media coverage in response to the pronounced discrepancy between what the government formally declares and what it actually does in practice, the reform impetus toward the creation of more democratic and autonomous local government units seemed to have once again been offset by the economic crisis of the last decade, which triggered a shift of government priorities toward fiscal consolidation and restoration of sustainable public finance.

### Synonyms

Bureaucracies; Formal organizations; Hierarchies; Machine bureaucracy; Milgram's bureaucracy; Weberian state

### Definitions

Bureaucracy has been defined as "a continuous organization of official function bound by rules" (Weber 1947, p. 330). Rules, regulations, procedures, and standards are designed to achieve organizational goals. Control is a mechanism used in bureaucracies to ensure the orderly conduct of the behavior of staff. For example, in Weber's view, administrative acts, decisions, and rules are captured in writing (Weber 1947, p. 332).

Therefore, a bureaucratic structure is a rule-bound governmental and administrative system. Bureaucracies are seen as organizations in which tasks are divided among technical specialists who devote their full working capacity to the organization and whose activities are coordinated by rational rules, hierarchy, and written documents.

A bureaucratic structure can be termed as a formal organization, which has a hierarchical structure defining the various reporting relationship that exists between the members of a lower level and a high level. Therefore, a bureaucratic structure also denotes the rationalization of the social structure of the organization to bring about order and stability.

Therefore, the structure of bureaucratic decisions refers to the process of decision-making in a bureaucratic context, for example, the act of policymaking by the legislature or a government agency in which rules and procedures are followed in the formulation and implementation.

### Introduction

Bureaucratic structure implies a distinct organizational form that is hierarchical, formalized, and specialized with a clear functional division of labor and boundaries as well as standardized rules, and regulations (Olsen 2005, p. 1). A bureaucratic structure is intended to regulate the use of power because, it clearly demarcates the level of discretion a bureaucrat can exercise through the division of labor, functional specialization, merit-based promotion, and recruitment, impersonal relationships, etc. leaving little room for abuse of power by public officeholders.

Additionally, Haveman and Kluttz (2015, p. 1) seem to agree by explaining that bureaucratic structure is a planned division of labor shared among public officer holders whose regular activities and formal authority are governed by rules and regulations. It denotes a hierarchy of offices in which authority flows from top to bottom and information flows from bottom to top.

Burns and Stalker's study linked organizational structure to organizational effectiveness, which was the first empirical study on the bureaucratic structure (Burns and Stalker 1994). A further discussion on the support for a bureaucratic structure in organizations suggests that the empirical data published between 1960 and 1999 reveal that there is not one constant form for

bureaucratic structure, but there is a clear occurrence of bureaucratic control (Walton 2005). This indicates that the structure of organizations might differ, but the bureaucratic control remains consistent; while the structure is relatively flexible, there seems to be some sort of constant value carried out by these organizations.

Further, bureaucratic structure shapes and channels how it gathers information and makes decisions (Bendor and Hammond 2010, p. 638). Decision-making in organizations follows procedures and rules that bear semblance with bureaucracy, and hence, the decisions are taken based on the hierarchical arrangements that the structure provides. Weber saw bureaucratic organizations as technically superior to other forms of organizations; it is faster and cheaper in its decision-making than any other form of administration. The remainder of the discussion includes the features of the bureaucratic structure and the structure of decision-making using the policy approach, and then draws conclusions.

## Bureaucratic Structure

A bureaucracy according to Mintzberg (1993) is a predetermined or predictable behavior or standardized behavior. Matte (2017, p. 5) observes that five major elements or factors are important in Weber's model of bureaucratic structures. These factors are hierarchical order, rigid rules and procedures, impersonal relationships, bureaucratic transactional leadership, and bureaucratic transformational leadership. Similarly, Hummel (2008) notes that hierarchy and high structures are characteristics of bureaucratic structures as the most standard type of organization structures. Hummel opines further that "the chain of command goes straight up the chart with a decreasing lateral spread, like a triangle" (Hummel 2008, p. 76). However, the most compelling features of a bureaucratic structure include formalization of behavior and operating rules, centralization of authority, and planning and control systems (Ferrell and Skinner 1988, p. 104).

Formalization of behavior can take three forms: (1) formalization by position specification, (2) by workflows, and (3) rules (Mintzberg 1993, p. 34). The use of formalization is to regulate individual members' work and behavior. The result of this is a fully developed vertical specialization of jobs, which is skilled jobs. Additionally, formalization relates horizontal specialization with narrower unskilled jobs being simple and repetitive. The purpose of formalization is to "reduce its variability, ultimately to predict and control it" (Mintzberg 1993, p. 34). Also, once formalization takes place, it is easier to coordinate the activities of the different parts of the bureaucratic structure. Sometimes, formalization enables the structure to function like a machine, which leads to the efficient production of goods and services. Formalization can be used for other purposes such as ensuring fairness to clients, where the principles of "first come first serve" in government organizations are used to avoid the displeasure of service seekers.

Another feature of a bureaucratic structure is centralization. Centralization "refers to the hierarchical level that has the authority to make a decision" (Ferrell and Skinner 1988, p. 104). Also, the use of centralization is to achieve coordination and control. It is the power given to an individual to make decisions as a top executive and enforce its implementation through lower structures beneath it by supervision. Decision-making is affected by where it is coming from. For example, if the decisions come from the top-level, such authority is centralized; however, if it comes from the bottom of the structure, such decisions are decentralized. Centralized decision-making gives more power to a few individuals in the vertical structure who are found at the strategic apex of the organization while decentralized decisions come from both the horizontal and vertical structures. Here, decision-making is two-way traffic, from both upward and downward streams. Further, since centralization is closely linked to the exercise of the authority which is located in the formal hierarchy of the bureaucratic structure, two critical issues emerge (1) position in the organization rather than personal characteristics, and (2) the compliance of subordinates because they perceived that

superiors have a legitimate right to exercise authority (Ferrell and Skinner 1988, p. 104).

Control systems are another form of a bureaucratic structure and it refers to target setting, measuring, monitoring, and providing feedback on task performance (Brignall and Modell 2000). Action planning is a key component of a bureaucratic structure, which is used to set desired outputs. Control systems are needed in the structure because it is viewed as a tool to assess whether or not the targets are met. Control systems mostly consist of rules, standards, and internal procedures to guide individual behavior and workflows.

Bureaucratic structures affect decision-making in organizations. The structure of the organization in which decisions are made may affect whether the organization has a predisposition to be more lenient or more stringent in eligibility determinations (Keiser 2011).

Also, bureaucratic structures can be seen in all forms of governance at both the local and the national levels. Trondal (2010, p. 1) argued that studies suggested that international bureaucracies change world politics, affect power distributions across levels of government, and transform domestic democratic governance. Consequently, governance is built on public policy, and the decisions taken are closely tied to the bureaucratic structures found in government and state institutions. Based on this understanding, the next section will discuss the structure of bureaucratic decisions using the public policy approach.

## Bureaucratic Decisions: The Public Policy Approach

This section first discusses public policy and the actors within the bureaucratic structure that formulates policies followed by the models of decision-making in bureaucracies. The purpose is to understand the dynamic nature of decision-making in government bureaucracies.

Meier and Bohte (2006) defined policy as a purposive course of action followed by actors or sets of actors related to the government on a problem or matters of public concern. Public policy is "what governments choose to or not to do" (Dye 2016). Suzuki and Hur (2018, p. 1) have identified significant influences of bureaucracy in public policies, their implementation, and socioeconomic outcomes. In so doing, they create the public policy that the public actually experiences. Peters (2009, p. 7) asserts that the task of implementing public policy continues to be largely the same as it has been for decades or even centuries. The most remarkable change in the role of the public service and for governing, in general, is that there is much less predictability and there are often competing demands placed upon people at all stages of governing – from ministers through to the lowest level clerks (Peters 2009).

Theodoulou and Cahn (2013) identify several actors in the policy process. He identifies institutional and noninstitutional actors by exploring the functions and influence that policy actors exert in the policy process. Popoola (2016, p. 47) also categorizes the actors into official and unofficial policymakers. The "Unofficial policymakers" do not occupy formal public positions or political offices; they are interest groups that demand policymakers to address problems affecting their members while the "official policymakers" are those who possess the legal authority to engage in the formulation of public policy through the bureaucratic structure. The official actors, in this case, are summarized in the following:

> "Congress, the president, executive agencies, and the courts—and the non-institutional actors—parties, interest groups, political consultants, and the media. . . In addition, the vast network of organized citizen groups (parties, interest groups), as well as the rise of the electronic media, political consultants, and other image-making professionals, further complicates the process" (Theodoulou and Cahn 2013, p. 41).

## The Rational Decision-Making Model

A rational man is a decision-maker that takes the action, after some courses of regulation, that is, the definition of what is feasible and what is desirable, which are independent of each other (Matte 2017). A rational decision-making process is often suggested as the way in which decisions

should be made, and it involves following a strictly defined sequential process. Rationality in relation to decision-making refers to a process that is perfectly logical and objective, whereby managers gather information objectively, evaluate available evidence, consider all alternatives, and eventually make choices that will lead to the best outcomes for the organization.

The best known of the rational-comprehensive model was one developed by Herbert Simon. It is the most normative of the rational policy-making models. Tiernan and Morley (2013) observe further that most models of decision-making include six essential steps: (1) identify and diagnose the problem; (2) identify alternative solutions; (3) evaluate alternatives; (4) choose an alternative; (5) implement the decision; and (6) evaluate the decision. In explaining these processes further, Dye (2016) argued that "rationality assumes that preferences of society as a whole can be known and weighted" (Dye 2016, p. 3). It is also not enough to identify and weigh the values of some groups to the neglect of others, thus, the rational model assumes a complete appreciation of societal values. The rational model further necessitates information about alternative policies and the prognostic capacity of policymakers to forecast precisely the consequences of alternative policies as well as the acumen to compute with accuracy the ratio of costs to benefits.

"In the rational school of thought, Weber saw bureaucratic organizations as technically superior to other forms of organization; it is faster and cheaper in its strictest form than any other form of administration" (Weber 1947, p. 332). Olsen (2005) also posited that bureaucracy could be seen as a rational tool for executing the commands of elected leaders. In this perspective, it is an organizational apparatus for getting things done, to be assessed based on its effectiveness and efficiency in achieving predetermined purposes. Rationality is a very important part of the bureaucracy. This is highly demonstrated through Milgram's experiment. For Hummel (2008) reason rationalizes, modernizes, and creates the modern world. Others too share an opposing view. One of the limitations of bureaucracy is its power of obsession with what is called "rationalist thinking," an approach that prescribes utility and practical solutions to the challenges spotted (Shaikh et al. 2018).

## Bounded Rationality Model

According to Selten (1999), the term "bounded rationality" follows the tradition of Herbert Simon's view of decision-making in administrative settings. It refers to rational principles underlying the non-optimizing adaptive behavior of real people. Grune-Yanoff (2007) suggested that the notion of bounded rationality has recently gained considerable popularity in the behavioral and social sciences. Bryan (2003) argues that bounded rationality means that decision-makers are intendedly rational; that is, they are goal-oriented and adaptive, but because of human cognitive and emotional architecture, they sometimes fail, occasionally in important decisions. Grune-Yanoff (2007) opines that conceptually, however, the usage of the term often differs even within the same discipline. At least four important usages of "bounded rationality" can be distinguished:

(i) To criticize standard theory
(ii) To enrich behavioral models and theory
(iii) To provide appropriate rational advice
(iv) To explicate the concept of rationality

## Incremental Decision-Making Model

Lindblom (1959) developed the incremental model. Lindblom believed many small steps would likely lead to a good decision, or that at least minimal damage would be done because the change would be marginal. The incrementalist approach is more cognizant of the political challenges inherent in policymaking. Incrementalism according to Lindblom (1979), however, does not simply mean change occurring in small increments, it can be large increments that take place in the policymaking process. Dahl and Lindblom (1953) explained incrementalism as:

> . . . a method of social action that takes existing reality as one alternative and compares the probable gains and losses of closely related alternatives by

> making relatively small adjustments in existing reality, or making larger adjustments about whose consequences approximately as much is known as about the consequences of existing reality, or both. Where small increments will clearly not achieve desired goals, the consequences of large increments are not fully known, and existing reality is clearly undesirable, incrementalism may have to give way to calculated risks. Thus, scientific methods, incrementalism and calculated risks are on a continuum of policy methods. (Dahl and Lindblom 1953 cited in Bailey and O'Connor 1975)

## Process Decision-Making

Social and economic policy in any modern society has many dimensions. No policymaker, whether an autocrat or a democratically chosen legislature or executive, can implement policies directly. The tasks of collecting the requisite information, enforcing the rules, collecting revenues and disbursing payments, initiating and supervising public projects, and so on must be delegated to people and organizations that have or can develop special skills in these matters. Therefore a bureaucracy for policy implementation is unavoidable and the process model is an organizational decision-making tool used by bureaucrats which are often governed by rules and procedures.

## Political Decision-Making

The political model concentrates on the impact of organizational politics on decision-making. Power and politics play an important role in the decision-making process. Power is the ability to influence others. In the context of an organization, power can be viewed as the ability to exert influence over individuals, workgroups, or departments. There are five main types of power found in the organizational setting: coercive, legitimate, expert, reward, and referent. Verma (2014) argues that with the political model, decision-makers concentrate on many problems within an organization reflecting the personal goals of different subunits rather than focusing on a single issue. This model considers decision-making as a process of distinct resolution, building agreement, and decisions as a compromise among subunits.

## Challenges of Bureaucratic Decisions

Shaikh et al. (2018, p. 255) compared bureaucracies to an iron cage administered by closed-minded professionals who have almost no empathy and interest that can stretch outside their area of expertise. Several writers have a notion that bureaucracies are actually poor arenas for those who innovate. Also, the rationality of instructions illustrates how the instrument of bureaucracy can be used for good or bad of which, the bureaucracy is dependent on good instructions to do good work. Political interference, corruption, abuse of power, and nepotism are all challenges to bureaucratic decisions (Shaikh et al. 2018). Further, a formal organization can sometimes be a facade, and bureaucrats may not act in accordance with the institution's ethos and codes of conduct.

## Conclusion

The bureaucratic structure and its relevance to decision-making is a mouthful. Also, the bureaucratic structure continues to contribute to decision-making in government institutions as major policy choices are determined by the most national constitutions which set the regulations to direct public policy. Consequently, public policy models inform bureaucrats what kinds of rules and standards should be used to compare various policy options before adopting and implementing a set of alternatives.

# Structure of Nonprofit Organizations

Jeffrey Aulgur
Arkansas Tech University, Russellville, AR, USA

## Synonyms

Nonprofit design; Nonprofit frameworks; Nonprofit organization

## Definition

Structure is a system of explicit and implicit institutional rules, lines of authority, accountability, and rights and duties, which determine how organizational roles, power, and responsibilities are deployed to achieve a common goal.

## Introduction

An entity gains charitable status in the United States by application to the Internal Revenue Services, and, once granted, the organization is identified as tax exempt. The designation *nonprofit organization refers* to "agencies with nonprofit and charitable status, governed by a board of directors, delivering programs and services, and for the most part involving volunteers in the service of delivery" (Inglis et al. 1999, p. 155). In return for this tax-exempt designation, the charity must meet certain expectations with regard to its organizational structure.

The structure of voluntary and nonprofit entities in the United States is offered as one many across the global stage. In Japan, the Law to Promote Specified Nonprofit Activities created a class of corporations known as specified nonprofit entities. Such entities receive approval from the National Tax Administration Agency to received income tax donations (Japan NPO Center n.d.). Trusts, societies, and section 8 companies in India provide donors income tax and corporate tax benefits in India. The Income Tax Act of 1961 requires nonprofit organizations in India to be organized for religious or charitable purposes (NGOs India n.d.). In Brazil, the Civil Law Code allows two forms of private nonprofits, associations and foundations, both of which must be disallowed from distributing profits and must validate expenditures that are related to the respective mission. Unlike the majority of tax-exempt corporations in the United States, Brazilian law freely allows nonprofit entities to engage in legislative and political activities (Council on Foundations 2015a). In Germany, associations, foundations, and limited liability companies may receive tax-exempt status under federal civil law it is exclusively engaged in the pursuit of public benefit, benevolence, or religious-based purposes (Council on Foundations 2015b).

The structure of nonprofits worldwide may be examined through the domains of governance, administration, and programs. First, the governance standard requires an uncompensated board of directors to serve as the stewards of the public trust in exchange for its designation as a tax-exempt organization. The governing board must meet its fiduciary responsibility to the organization through the duties of care, loyalty, and obedience. Second, the board of trustees delegates its operational authority and accountability to the executive director (or chief executive officer). As the only employee directly employed by the board, the executive establishes an administrative structure designed to operationalize the organizations' mission. This structure is highly dependent on the resources, financial and otherwise, available. Finally, the wide array of services delivered by the nonprofit community is examined through the lens of four nonprofit archetypes: public charities, foundations, social advocacy organizations, and professional organizations and trade associations.

## Governance

The expected governance structure for nonprofit entities in the United States is long established. A board of directors is selected and empowered by the organization's articles of incorporation and operational bylaws. The article of incorporation, generally filed with the state in which the nonprofit is located, establishes the purpose of the charity. The board of directors adopts a set of bylaws as the organization's operational guidance. The board of directors (sometimes referred to as a board of trustees) has six main responsibilities: to provide adequate resources to sustain their organization's mission, to establish organizational policies and mission, to establish corporate operating procedures, to employ/terminate the executive director/chief executive officer, to accept a fiduciary oversight obligation with fiscal policy and boundaries, and to maintain a communication link to the community (Wolf 1999). The board of directors, as stewards of the public trust, is responsible for ensuring that the public interest is met and that organizational revenues are used to only support the charity's purpose as established in the article of incorporation. The board of directors of a nonprofit entity may delegate the day-to-day

work to the executive director and the operating staff, but it may not transfer its legal obligations or their responsibility for the nonprofit's operations. A fiduciary relationship is a relationship of trust and confidence designed only to meet the needs of the nonprofit entity. Nonprofit board members have three primary duties which establish the fiduciary foundation of nonprofit governance.

Duty of Care. Each board member has a responsibility to participate in the decision-making on behalf of the organization in the same manner as any reasonable and prudent person. These decisions must be informed, meaning the board member should seek any information necessary to make such a decision. Without active participation in governance activities, the board member cannot meet the duty of care expectation.

Duty of Loyalty. Board members must place the interests of the organization first, and all personal interests must be set aside, whether the philanthropic activity is in the present or the future. All transactions must have the best possible outcome for the organization. Nonprofit board members have a duty to disclose any existing or potential conflict of interest with the best interest of the organization.

Duty of Obedience. Board members must be obedient to the nonprofit's bylaws, policies, and mission of the organization and may never act or use organizational resources in a manner incongruent with the mission.

BoardSource, a national organization whose mission is to inspire and support excellence in nonprofit governance and board leadership, identifies the Ten Basic Responsibilities of Nonprofit Boards:

*Determine the mission and purpose*. It is the board's responsibility to create and review a statement of mission and purpose that articulates the organization's goals, means, and primary constituents served.

*Select the chief executive*. Boards must reach consensus on the chief executive's responsibilities and undertake a careful search to find the most qualified individual for the position.

*Support and evaluate the chief executive*. The board should ensure that the chief executive has the moral and professional support he or she needs to further the goals of the organization.

*Ensure effective planning*. Boards must actively participate in an overall planning process and assist in implementing and monitoring the plan's goals.

*Monitor and strengthen programs and services*. The board's responsibility is to determine which programs are consistent with the organization's mission and monitor their effectiveness.

*Ensure adequate financial resources*. One of the board's foremost responsibilities is to secure adequate resources for the organization to fulfill its mission.

*Protect assets and provide proper financial oversight*. The board must assist in developing the annual budget and ensuring that proper financial controls are in place.

*Build a competent board*. All boards have a responsibility to articulate prerequisites for candidates, orient new members, and periodically and comprehensively evaluate their performance.

*Ensure legal and ethical integrity*. The board is ultimately responsible for adherence to legal standards and ethical norms.

*Enhance the organization's public standing*. The board should clearly articulate the organization's mission, accomplishments, and goals to the public and garner support from the community (Ingram 2008; BoardSource 2009).

Individuals who serve as members of a nonprofit board of directors are the organization's ambassadors, advocates, and community representatives who function as stewards of the public trust by exercising a legal and fiduciary responsibility (Kendall 2009; Wolf 1999). Nonprofit directors in the United States are, with few exceptions, unpaid volunteers with a commitment to the organization's mission. In the wake of recent mismanagement of nonprofit assets and resources, nonprofit boards of directors have reassessed their roles and the stewardship with which they are entrusted (Connelly 2004). Green and Griesinger (1996) found that most nonprofit

organizations lacked commitment to board member training and development. However, as the vast majority of nonprofit organizations in the United States are governed by a volunteer board of directors, the lack of time available for volunteers, combined with little or no emphasis on board member development, has contributed to a sector administered by individuals who often have little knowledge about nonprofit governance.

## Administration

The administration of nonprofit entities is as broad and varied as the services provided by the sector. For example, a newly established local food pantry may employ the executive director as the only paid employee, while a multinational hunger relief provider has hundreds of foreign employees fulfilling its mission. Regardless of the entity's size or scope, the board of directors is responsible for the employment of the executive director (or chief executive officer, as the terms are interchangeable). The executive director is responsible for implementing the policies, programs, and initiatives identified by the board of trustees through the day-to-day operational oversight. Their responsibilities of the executive director are staff management, development of management policies and programs, and serving as the staff liaison to the board of directors.

### Staff Management

As noted above, the only individual employed by a board of directors is the executive director; the executive director must then hire, supervise, and motivate the staff of the nonprofit. Entities of substantial size and resources often model team management in a form similar to a for-profit corporate structure. The terminology used to identify an organization's most senior executives is widely varied in the nonprofit sector (e.g., vice president, director, chief operating officer). For clarity, vice president is used as a representative title for all such critical nonprofit positions and their respective responsibilities identified below. The role and scope of these posts vary widely and, in many cases, are combined in nonprofits for purposes of efficiency. The hiring authority for the executive positions is, in most cases, the executive director of chief executive officer. The following positions and respective descriptions are typical of those found in corporately structured entities. For those nonprofit organizations smaller is size and scope, it is not unusual for one person to assume the responsibilities of multiple positions.

*Vice President for Development*. Responsible for acquiring third-party resources (financial or in-kind) for the support of the organizational mission. Fundraising initiatives may include annual giving initiatives, capital campaigns, major gift solicitation, planned giving, and grant proposals.

*Vice President for Finance*. In close collaboration with the executive director, this individual develops and implements the financial strategy for the nonprofit entity. She oversees all fiscal and fiduciary responsibilities of the organization.

*Vice President for Operations*. Oversees all program areas, including program development, delivery, and evaluation. This individual is critical to the mission success, as he or she must provide program leadership and management, cultivate and sustain external relationships, and ensure key products and outcomes are attained.

*Vice President for Planning and Marketing*. Responsible for the communication and branding strategy for the organization, while serving as the nonprofit's external ambassador. This individual oversees the production and sustainment of newsletters, websites, social media, print media, and all aspects of advertising.

*Vice President for Community Affairs*. This individual promotes the mission of the nonprofit by establishing broad-based and grassroots advocacy initiatives, interacting with government, coalitions, and constituent groups and communicating the organizational issues and priorities through community relations.

*Vice President for Human Resources*. Responsible personnel policies, human resources procedures and objectives, employee relations, performance management, wage and salary, and recruiting of future team members. Unique to the nonprofit sector, the Vice President for Human Resources may have the additional responsibility of volunteer management.

## Management Policies and Program

While the board of directors establishes the vision, mission, and policies of the nonprofit organization, it falls to the executive director to operationalize the directives and guidance of the governing body. The executive director guides the staff to achieve the nonprofits' charitable purpose. Due to the diversity of the nonprofit sector in size, scope, mission, and resources, it is recommended that management policies and programs are viewed through the lens of the respective organization. However, nonprofit organizations must manage several key domains.

*Fundraising*. One of the major differences between the for-profit and the nonprofit sector is the nonprofit organization's need to generate resources through donations. The relationship between the executive director, who must lead the team to the accomplishment of the mission, and the chief fundraising professional, who must find the resources to fund the mission, is critical to organizational success. While the executive director is organization centered, the development officer is donor centered.

*Financial Management*. The level of financial expertise varies from simple bookkeeping skills and cash flow management to complex multinational transactions with complicated tax reporting requirements. The key to successful nonprofit financial management is leaders with the appropriate level of expertise. The nonprofit organization must establish appropriate accounting procedures and controls to mitigate the risk of fraud, waste, and abuse. The general public has imposed a higher expectation on nonprofit organizations than for-profit entities because nonprofits are granted tax-exempt status by the government. Recent scandals and financial collapse in both sectors influenced the legislation in the United States commonly known as the Sarbanes-Oxley Act (formally the *American Competitiveness and Corporate Accountability Act*). While the Sarbanes-Oxley did not directly target the nonprofit community, two provisions do apply to the nonprofit sector: the protection of whistle-blowers and the destruction of litigation-related documents. Regarding the board of directors, the governing body does not have operational control of finances, but it is ultimately responsible as a part of its fiduciary responsibility.

*Public Relations*. It is critical for a nonprofit organization to develop a positive public image of the entity and its mission to achieve mission and goals. Organizations must create a short-term (1 year) and long-term (3–5 years) public relations plan which targets both those closest to the organization (internal audience) and those who are independent of the organization (external audience). The priorities of the public relations plan must be congruent with organizational mission, and it must contain the following components.

Key messages – What are the one or two most important ideas the organizations wishes to communicate to its audience.

Strategies – What grand design or overall approach should the organization adopt to reach its targeted audiences?

Tactics – What tools should the organization employ to carry out its strategies?

Timetable – What is the realistic period for developing and carrying out the strategies the organization plans to adopt?

Budget – What should the size and scope of the organization's public relations program be? (M Booth & Associates 1995).

*Lobbying*. Lobbying, in its most pure form, is the attempt to influence, defeat, or modify legislation. It is a common misperception that public charity organizations (i.e., 501(c)(3) entities in the United States) are forbidden from lobbying due to their tax-exempt status. Such entities may lobby as would any other corporation or individual with two restrictions imposed by the Internal Revenue Service. First, publicly supported charities are restricted to committing no more than an insubstantial amount of activity to lobbying (measured by either the facts of a particular case or the amount of organizational monies devoted to lobbying). Nonprofit entities engage in both direct lobbying (direct communication with a legislator or governmental entity) and grassroots lobbying (the attempt to influence the opinion of the general public). In the United States, the Internal Revenue

Service tax-exempt status establishes the limits, or lack thereof, of allowable lobbying activity. For example, a 501(c)(5) (Union) may use funds for political advertising; 501(c)(4) social welfare organizations, commonly referred to as super PACs, are allowed to participate in political activities as long as it does not exceed 50% of total expenditures (Internal Revenue Service n.d.).

*Strategic Planning and Strategic Thinking. BoardSource* (2010, p. 189) defines strategic planning and strategic thinking as follows:

- *Strategic thinking* – The ingrained practice of asking far-ranging questions to help clarify thorny problems, offer breakthrough insights on pressing issues, present new ways of thinking about challenges and opportunities, look at the ramifications of board decisions, and actively generate significant strategic ideas.
- *Strategic planning* – A process conducted in partnership with staff in which the board draws on an understanding of organizational strengths and weaknesses and environmental trends to articulate priorities and monitor progress against financial and programmatic goals.

Both the board of directors and the executive leadership must engage in strategic thinking and strategic planning to ensure organizational success. Strategic thinking requires only a forward-thinking leadership team and an engaged board of directors to be successfully deployed. Strategic thinking requires little in corporate resources other than time. Strategic planning may require a significant investment of time and money depending on organizational complexity. While a local homeless shelter may develop a strategic plan relevant to its needs in full day of work by the staff and the board of directors, a public university will likely commit an academic year to strategic planning involving multiple committees of faculty and staff, review and comment by the public, approval by the university president, and, finally, the adoption of the governing board of trustees.

*Quality and Evaluation*. Organizational effectiveness is a term with no single definition or scenario in relation to the nonprofit community; it is hard to define, much less measure, due to the wide disparity of the nonprofit community in the United States, including the varying types of nonprofit organizations and their wide range of financial capabilities, resources, and missions. That inconsistency in the nonprofit sector leads to a broad array of hypotheses in the nonprofit literature that would measure organizational effectiveness. Callen et al. (2003) argued that no single criterion of organizational effectiveness is viewed equally in the nonprofit community. Mwenja and Lewis (2009) stated that organizational performance is ultimately a social construct – one that, combined with poorly articulated goals, makes the development of a single model of measurement of nonprofit effectiveness virtually impossible.

Nonprofit stakeholders, including constituents, donors, and government, increasingly expect nonprofit providers to measure objectively the service provided and the efficient use of financial resources. Additionally, competition continues to grow for the nonprofit sector on two fronts: first, the for-profit sector has entered many markets generally considered nonprofit territory (e.g., proprietary institutions of higher education, hospitals); second, many communities now have multiple nonprofits providing equivalent services in direct competition (e.g., thrift stores operated by Goodwill, the Salvation Army, and others). Each organization must determine its standard of organizational success and effectiveness and develop an evaluation model to capture evidence and generate measurable results.

*Risk Management*. Regardless of the mission of the nonprofit organization, the risk is evident, and the nonprofit should implement appropriate and relevant risk mitigations strategies. Risk management and mitigation in the nonprofit sector are not limited to the direct provision of services. Risk, for example, exists in employment practices, facilities, financial practices, general liability, volunteers, workplace safety, technology, unrelated business activities, and partnerships with for-profit counterparts. Every organization should engage in risk management not only to protect its reputation and assets but to reduce the possibility of costly litigation. Risk management

begins by evaluating all aspects of the organization for potential risk and implementing strategies to minimize risk wherever possible. For example, nonprofit organizations must ensure they have all forms of proper insurance in place, including directors and officers insurance, general business insurance, workers' compensation insurance, and unemployment compensation insurance.

*Volunteer Management*. For many organizations, volunteers are necessary to accomplish mission-critical activities and to perform other day-to-day operational tasks that may not be otherwise affordable. Youth sports leagues, churches, and large-scale events (e.g., a marathon as a fundraiser) are not feasible without volunteer labor at multiple levels. Perhaps the most critical of volunteers for any nonprofit organization is the board of directors. While beneficial in most instances, the use of volunteers is not without challenges and risk. Potential volunteers expect a defined job with clear guidance and expectations. First, many nonprofits lack a dedicated volunteer manager, and volunteers are often directed to one service component or another to determine if their services are needed. Second, potential volunteers bring potential risk, and they must be appropriately vetted to mitigate risk, especially if services involve children, the elderly, or those with disabilities. Finally, volunteers are transient. Overall retention rates for volunteers is very low, and many do not stay as long as a single year. Each entity must evaluate the cost versus benefit of a volunteer program.

## Programs

Nonprofit corporations cover a broad spectrum of services and operations: 501(c)(3) charities, such as the American Cancer Society or the United Way; foundations, such as the W.K. Kellogg Foundation or the Arkansas Community Foundation; social welfare or advocacy organizations, such as the American Civil Liberties Union or the Southern Poverty Law Center; professional/trade associations like the Chamber of Commerce; religious organizations; and so on. Additional entity exemptions from federal income tax are identified in Section 501(c) and include, but are not restricted to, 501(c)(5) labor, agricultural, and horticultural organizations, 501(c)(6) business leagues, 501(c)(7) social and recreation clubs, and 501(c)(4), 501(c)(9), and 501(c)(17) employees' associations (IRS 2010). For clarity, four broad categories of nonprofit organizations are discussed: public charities, foundations, social advocacy organizations, and professional and trade organizations.

*Public charities*. Public charities are the entities most consider when presented with the word *charity*. Public charities provide social services, advocate for others, advancing religious causes, science, and education. According to Guidestar (2001), a public charity is a charitable organization that (a) has broad public support, (b) actively functions to support another public charity, or (c) is devoted to exclusively to testing for public safety. The public charity, as its primary purpose, must center on philanthropic goals. Public charities must rely on governmental funding and private philanthropic support to main its tax-free status.

*Foundations*. Unlike public charities, the primary purpose of a foundation is to provide financial assistance to independent organizations or institutions. Foundations are one of two types. A private foundation is established through the financial largesse of an individual, family, or corporation. A public grantmaking foundation, like public charities, receives financial support from a broad coalition of donors to provide grants to persons or other entities (e.g., educational scholarships, scientific research, building projects).

*Social advocacy organizations*. Social welfare or support organizations provide a vehicle for agencies and individuals to influence public policy affecting a mission, cause, or service which they find personally important. Advocacy is not lobbying; advocacy describes how an organization has assisted a group of people or a cause and educates stakeholders and public figures on the influence of public policy, whether positive or negative. Effective advocacy often includes identifying the right audience, having a persuasive message, and including an individual or local perspective. The American Civil Liberties Union (ACLU), the National Rifle Association (NRA),

and the National Association for the Advancement of Colored People (NAACP) are examples of social advocacy organizations.

*Professional and trade organizations*. Professional and business organizations are membership-based and serve the interests of the membership, whether the members are from a common profession (lawyers, doctors, accountants) or trade (membership of companies in a particular industry). Professional and trade organizations do not include labor unions. Professional organizations provide continuing education opportunities, networking, scholarships, and assistance in locating employment to its members. The American Medical Association is an example of a professional organization. Trade organizations, on the other hand, focus on the collaborative efforts of its member organizations. These collaborative efforts may include lobbying and political donations to gain favorable legislative or governmental support to influence public policy. Trade organizations also offer professional development and conference opportunities for individuals affiliated with member organizations.

## Conclusion

The nonprofit landscape is vast in size, scope, and mission. This diversity in the nonprofit sector is very apparent in the structure of nonprofit entities, whether they are a public charity, a foundation, a social advocacy organization, or a professional or trade organization. The structure of a nonprofit entity includes its governance, administration, and programs. The governance structure of any nonprofit entity is established by the strength of the governing body's commitment to its fiduciary responsibility, as expressed through the duties of care, obedience, and loyalty. As the only person directly employed by the board of trustees, the day-to-day management and operations of the organization are the domain of the executive director. She has the responsibility of successfully operationalizing the entity's mission while implementing the guidance of the governing board. The breadth and structure of management operations and administration are influenced by the size and scope of the organization. The range of nonprofit diversity in programs delivered by the sector is not easily classified. A detailed exploration of a single nonprofit organization may be necessary to understand the intricacies of nonprofit governance, administration, and programs.

# Structured Program Improvement Approach

Michael A. Emmart
Professional Development Program, Rockefeller College, University at Albany, Syracuse, NY, USA
Regional Office Project Associate, New York State Office of Children and Family Services, Syracuse Regional Office, New York, NY, USA

## Synonyms

Program improvement planning; Strategic planning

## Definition

The Structured Program Improvement Approach (SPIA) provides a model for program improvement planning comprised of a six-step process for identifying themes emerging from regulatory assessment – recognizing underlying factors, developing responsive strategies, and defining accountability measures that can be monitored during periods of implementation.

## Introduction

Organizing the response to state and federal assessments creates significant pressures upon organizations that serve the public. Local school districts, county departments of social services, hospitals, universities, and mental health clinics are all subject to regular assessment of their services with evaluative instruments that seek to measure their work against industry best practice by auditors from licensing agencies.

The hierarchical relationship between the assessor and the organization being assessed is typically manifest in the requirement of a program improvement plan of some sort, a standardized effort at responding to each of the findings of said assessment. That said, the findings of most instruments are more likely to reveal symptoms of underlying problems, which creates a dilemma: does the organization plan address the symptoms or explore the underlying factors that influenced the findings that have been identified? Typically, agencies decide to address symptoms – largely because they lack a standardized way to document the connections that develop. Unfortunately, this limits the ability for improvement, and most organizations find themselves cited with the same findings in future assessments. The Structured Program Improvement Approach (SPIA) was developed to provide a standardized practice for (a) connecting assessment findings to underlying themes, (b) developing problem statements, (c) establishing strategies for improvement, and (d) documenting the process in a manner that is sufficient for auditors.

## Process

Initially designed to support child welfare agencies, the process suggested by SPIA recognizes the need for program improvement planning that is responsive to the significant strain within most

departments of social service – most of which have 7–10% (or more) of their positions unfilled, annual turnover rates of 20–40%, and 2-year turnover rates as high as 90% (Kim and Kao 2014). Facilitating improvement planning with such a stressed organization must allow for the development of interim, short-term, and long-term goals so that the process of change does not exceed the agency's capacity for change (Ahn et al. 2017). Such planning should begin with a review of the findings – the data that will be utilized in the crafting of goals – and include a cross section of staff so that workers at all levels understand the important performance indicators, which can be difficult given the aforementioned high turnover and potential for job stress to fracture relationships between frontline staff and agency leadership (Jolles et al. 2017). Involving all levels of staff during planning and implementation phases forestalls resistance and helps in not only the selection of change strategies but also the speed of their implementation (Kotter and Schlesinger 2008). Finally, the structure suggested recognizes that shifting conditions within a district or agency may call for plan revision, particularly since all identified issues cannot be simultaneously engaged. This is an important underlying principle that must be accepted by those performing the audit: requiring an agency to respond to each finding with an individual strategy is untenable – particularly when there may be a dozen or more findings following a given assessment. Organizations cannot incorporate dozens of new initiatives into practice; thematically grouping findings and creating strategies that address underlying issues impacting these categories is the only reasonable approach to support long-term change.

At its core, the Structured Program Improvement Approach is a process for the development of program improvement plans (PIPs). It relies upon the results of a formal assessment of practice to provide data identifying areas in need of improvement. This data may be qualitative, speaking to the interpretation of practice and lived experiences, or quantitative, such as considering the failure of a specific percentage of cases to meet an evaluative standard. While developed to support program improvement in child welfare, it is posited that application could be helpful in other disciplines as well.

The first step in this process allows for past performance data to provide a baseline for improvement, clearly tied to the gap analysis structure noted above, while also supporting hypothesis development and testing (Ahn et al. 2017; Lery et al. 2016). This focus continues within the process suggested by SPIA, with the results of any assessment serving as past performance data. Volkema's (1983) classic work on problem formation provided a clearly cogent argument for starting with a focus on results as data: "the process must begin with some sort of detection, discovery, or sensation that a need or opportunity exists" (p. 639). Therefore, the process described below is preceded by a presentation of the findings and a discussion to ensure their understanding. Those gathered to receive the presentation of data and develop the planned response should represent a cross section of the workforce within the organization, in order that differing levels of expertise and critical knowledge from throughout the agency are represented. Frontline workers must fully understand both the performance measures and the results for them to believe that change will be worthwhile and meaningful (Pulakos 2009). The involvement of supervisory and next-level management is similarly important, particularly when trying to employ a data-driven model within an outcome-oriented field such as child welfare, where families present with complex needs and day-to-day functioning often feels crisis-driven (Collins-Camargo and Royse 2010). This effort to capture a cross section of the workforce sets the foundation for productive evaluation of assessment results and better informs the practice improvement efforts that follow. If the effort doesn't have the "right people in the room," the product will be of limited use (at best) and runs the risk of being completely unimplementable.

### Organization of Findings

Following the presentation of findings, the first step suggested by SPIA would be the organization of these findings according to theme. In practice, I have prepared for this step by utilizing 5x7

Post-it notes containing the text of each finding that are placed on a wall in the order which they are (or will be) identified in the report – one finding per Post-it. Participants are asked to group these findings into themes on 25x30 newsprint hanging in the room – one theme per piece of newsprint. Practice to date has found that there are typically 4–6 findings per theme, although there is the potential for more – particularly if the assessment was broad and findings were closely connected.

### Development of Problem Statement

The findings having been organized by theme, the next task involves the creation of an overarching problem statement – one that will capture the prevailing theme suggested by the collection of findings on each piece of newsprint. It becomes important for the facilitator to keep in mind that within traditional process improvement undertaken by governmental agencies, there is a tendency for each of these findings to be addressed individually – which is why PIPs are often 20 pages or more. The product created within this step must address, at least in part, the data represented in each finding. Generally, this involves moving toward the development of a broader problem statement. Those assessment findings that don't clearly fit should be relocated to another theme or isolated unto themselves under a different category. Many times, the generation of this statement requires several iterations as participants work toward a statement that captures the concerns in a way that reflects their understanding of agency practice and capacity. When leading these exercises, I will usually write the statement atop the piece of newsprint containing the individual findings.

It is worth noting that participants should be directed on the need to differentiate that which isn't occurring from that which is occurring but not being documented. For example, the strategy required to address staff not meeting regulatory requirements for case contacts is different than the strategy for staff who are not contemporaneously documenting these contacts. This makes the clarification and applicability of the problem statement a critical point in this process.

### Exploration of Cause Related to Each Theme

The resulting problem statements having been created, the next step prescribed by SPIA would involve a structured brainstorming activity, in which small groups of those working on the project are asked to consider factors within their control that might contribute to the identified problem statement. The groups are encouraged to consider systemic issues, organizational values, relational dynamics, prioritization of tasks, and existing roles so to create a list of factors that, if addressed, would help to alleviate the present finding. These are understood to be individual pieces of the problem in its entirety. Vague characterizations of external issues and the assignment of blame are redirected to the extent possible.

Generally, I have attempted to divide those gathered into groups of four to six participants, encouraging for a variety of backgrounds to be represented within each group to allow for diversity of perspective on each of the problems. Groups are given 5 min to conduct the brainstorming activity before being asked to move to the next station, during which time they will repeat the steps until all groups have the chance to contribute to the list of contributing factors on each identified problem statement.

### Five-Whys Exercise

Upon reaching an effective thematic saturation of causal elements for each theme, the SPIA structure calls for utilizing the Five-Whys analysis described by Ohno (1988). Groups are encouraged to choose what they identify to be the most significantly contributing factor resulting from the brainstorm and employ Five-Whys to explore the potential underlying causes contributing to this factor. Depending upon the group's familiarity with Five-Whys technique, the facilitator may choose to guide the first effort and then let the group act autonomously thereafter. There may be occasions where those gathered don't grasp the technique, in which case the facilitator will be called upon to guide the process for each. Regardless of the facilitator's role, this step results in at least one Five-Whys exercise being engaged for each identified theme. Many forms used to capture program improvement planning call for the

identifying of "underlying factors" – when this is the case, the results of the Five-Whys exercise should be used in the completion of this section.

### Identification of Strategy

As eluded to above, if the most significantly contributing issue is chosen for analysis in Step 4, then the resulting Five-Whys exercise should provide the underlying factors related to the problem statement identified in Step 2. It is then posited that the development of a strategy to address one of these factors would have an impact upon the whole. This becomes the effort of Step 5. The small groups created during Step 3 are now dissolved, as the remainder of the exercise calls for a whole-group approach. The facilitator will review the results of the Five-Whys exercise(s) and help the group to identify one level to be addressed – typically that which the agency or district has the most control over. Here again, the group is reminded to consider existing strategies (what can be expanded?), previously identified strengths, systemic issues, organizational values, and other contextual or environmental factors that would need to be included within any plan for change.

As a matter of practice, I encourage groups to identify one strategy per theme. While I recognize that there is an inherent drive to address all the problems identified by any type of assessment, the more measured response is supported by research in the areas of program improvement and strategic planning as was detailed in the previous section.

### Establishment of Change Indicators

The final step in this structure is the identification of performance indicators that will allow for the monitoring and measuring of implementation prior to the next large-scale assessment. There are several different elements that could be identified here, including tools that need to be developed in support of the strategy, supervisory roles/responsibilities in support of implementation, and training needs. Items identified here should be understood as short-term goals that work to support the longer-term strategy identified above. As such, they should fit the parameters of the SMART goal paradigm (specific, measurable, achievable, relevant, and time bound). Monitoring efforts related to the larger goal are made possible through the monitoring of these change indicators.

## Benefits Provided by the Structure

Often, program improvement efforts in the aftermath of an assessment include findings identified solely by the assessing body listing off individual violations of regulation/administrative directive. This would be followed by the requirement that the body being assessed develops numerous strategies to improve in each finding. Since the assessment may have listed as many as 25 or 30 findings, the resulting plan could have upward of 100–150 strategies. This is overwhelming from an implementation perspective and proves impossible for the oversight agency to provide either oversight or support.

Agencies employing SPIA have indicated the opportunity to categorize findings and develop thematic problem statements that allowed them to focus more clearly on issues within their control while reminding them to leverage areas of program that were already high performing. The resulting plans were much less daunting, and their staff have received the findings in a manner that felt more collaborative; they did not feel persecuted by the results. The average number of findings has decreased, from 25–30 to 4–6; in some cases, 1 strategy has been identified as meeting the needs of more than 1 finding.

Those agencies conducting assessments have similarly reported the benefits of using SPIA in the development of required program improvement plans. The approach is clearly reflective of the CQI process; many agencies have sought to implement in recent years and allow for the establishment of a more reasonable number of strategies for which they have oversight and monitoring responsibilities. The overall structure, which includes the voice of staff at different levels and the discussion of the data that result from the assessment, models the partnership that is hoped for when working with those they serve. Finally, the careful development of change indicators (Step 6) helps to structure of oversight efforts.

Utilization of the process is also associated with increased efficiency in both the planning and implementation of strategies. Assessing agency leads have reported that utilizing SPIA saves an average of 2–5 h when compared to previous efforts to develop a program improvement plan following assessment; organizations being assessed have reported this savings as 4–8 h. The process also speeds up the implementation of strategies. Previously, the plan for improvement would develop over the course of weeks or months of back-and-forth efforts between the two parties; SPIA has allowed for the plan to be completed within one afternoon meeting, with little need for additional negotiations. This means that training needs can begin to be identified and supportive structures can be put in place much sooner: change is now months ahead of schedule. The inclusion of frontline staff also works to support the implementation of these strategies – their voice was included within the developmental process, making it more likely that staff buy-in can be assumed.

## Conclusion

Standardization in the performance improvement planning phase following assessment is critically important to large systems seeking to manage or provide oversight for several jurisdictions, particularly when the variables impacting upon performance required an individualized response. The Structured Program Improvement Approach allows for the streamlining of developing responses to assessment data by recognizing the limitation of organizations to implement numerous strategies, particularly when struggling to manage high turnover and budgetary limitations. It suggests a series of steps that allow for the thematic organization of findings, creativity in identification of underlying factors, and a manageable number of wide-reaching strategies that provide for clearly defined measurables.

While initially developed to support child welfare practice, it is suggested that SPIA has potential for application in other realms of social services, education, and public health. Although the strategies resulting from the application of this structure do not comprehensively address each finding resulting from programmatic assessment, it is suggested that requiring any organization to simultaneously prepare several strategies for dozens of findings is unrealistic and not monitorable. A broader approach that allows for the identification of themes associated with underlying factors is supported by research on organizational change and is in keeping with Continuous Quality Improvement and Appreciative Inquiry, both of which contributed greatly to the development of this model.

## Synonyms

Indonesia; Procurement; Public–private partnership

## Definition

Measurement of the satisfaction index of the Indonesian Public Private Partnership Procurement Regulation is conducted through the principles of forming good regulation.

## Introduction

Public Private Partnership (PPP) in Indonesia has been regulated since 1998 through the Presidential Decree (K*eppres*) Number 7 of 1998 regarding Cooperation between the Government and Private Business Entities in Infrastructure Development and or Management. In 2005, the government stipulated a Presidential Regulation (*Perpres*) Number 67 of 2005 regarding Cooperation between the Government and Business Entities in Infrastructure Provision to replace *Keppres* Number 7 of 1998 (Siagian, 2017).

In 2015, *Perpres* Number 67 of 2005 was replaced by the Presidential Regulation (the new *Perpres*) Number 38 of 2015 regarding Cooperation between the Government and Business Entities in Infrastructure Provision. Based on this new *Perpres*, 19 (nineteen) sectors, both economic and social infrastructures, can be conducted under PPP scheme (Article 5 Perpres 38 of 2015).

The new *Perpres* also divided the implementation of PPP project into three phases: the planning phase, the preparation phase, and the transaction phase. PPP Procurement is a part of the transaction phase.

To regulate the PPP procurement, the government has specified a Chairman of the National Public Procurement Agency of the Republic of Indonesia Regulation Number 19 of 2015 (*Perka*) regarding the Procedures For Implementation Of Business Entity Procurement in Public Private Partnership for Provision of Infrastructure.

Knowing how the PPP Procurement regulation is implemented for PPP projects in Indonesia is the aim of this study. It was conducted to measure the satisfaction of the stakeholders as *Perka* users.

## Concepts and Definitions

In formulating the design and research instruments, there will be a description of the concept of Public Private Partnership, *Perka*, and the Stakeholders Approach Model.

### Public Private Partnership

There are several aspects of public private partnership (PPP), namely: a partnership between the Government and a Business Entity in the Provision of Public Infrastructure (*Perpres* No. 38 of 2015), a long-term contract (WBI: 2012), the transfer of risk to the private sector (UNESCAP: 2011), government support, and return of investment (*Perpres* No. 38 of 2015).

As has been stated previously, PPP in Indonesia is regulated by *Perpres* No. 38 of 2015. This new *Perpres* has also mandated four implementing regulations, namely:

This paper is a part of Doctoral Dissertation.

1. The regulation of the procedures for the implementation of the government's cooperation with business entities in the provision of infrastructure, regulated by the National Development Planning Agency.
2. The regulation of payment for services availability within the framework of cooperation between the government and business entities in the provision of infrastructure that is sourced from the State budget, regulated by the Ministry of Finance.
3. Regulation of payment for services availability for the cooperation between the government and business entities in the provision of infrastructure that is sourced from the Regional budget, regulated by Ministry of Home Affairs.
4. Regulation of procedures for the procurement of the business collaborative entity of government and business entities in the provision of infrastructure, regulated by the National Public Procurement Agency.

### Stakeholders' Approach Model

Freeman et al. (2007) define stakeholders as "any group or individual who can affect or is affected by the achievement of a cooperation's purpose". Freeman et al. also classify stakeholders into two types, namely:

1. Primary stakeholders are those who are directly involved in the actions of an organization.
2. Secondary stakeholders are those who are not directly involved in the actions of an organization, but may affect or be affected by the actions/policies of an organization (Fig. 1).

Based on the opinion of Freeman et al. above, stakeholders in this study are defined as "an individual, group, or organization that participated involved, affected/impact, or that may affect the policies or regulations of *Perka*". By modifying these, the stakeholders are mapped as follows (Table 1):

## Satisfaction with *Perka*

The evaluation of the perceptions measurement of a regulation is different from that of the services performance or public satisfaction. For the measurement of the satisfaction index of *Perka* the indicator of principles forming good regulation mandated by Article 5 Law Number 12 Year 2011 on the Establishment of legislation is used, namely:

1. Clarity interest – every formulation of legislation must have a clear objective to be achieved.
2. Institutional or authorized/entitled agencies – any kind of legislation should be made by agencies/officials formers legislation authorized. Legislation may be reversed or annulled by law, when made by institutions/unauthorized officials.
3. Conformity between type and material content – in the establishment of legislation attention should really be paid to the substance of the right to the type of laws.
4. Can be implemented – every formation of legislation must take into account the effectiveness of legislation within the community, philosophically, juridically, and sociologically.
5. Usefulness and beneficiary – any legislation is made because it is necessary and useful in regulating the life of society, the nation, and state.
6. Clarity formulation – any legislation must meet the technical requirements of the preparation of systematic legislation and the choice of words or terminology, and the legal language must be clear and easy to understand, so that there is no variety of interpretations in the implementation.
7. Openness – the process of regulation formulation is started from the planning, preparation, preparation, and discussions are transparent and open. Thus, the whole society has the same opportunity to provide input in the processing of regulation.

In this study, six of the seven principles of forming good regulation – clarity interest; institutional or authorized/entitled agencies; conformity between type and material vontent; can be implemented; principle, usefulness, and beneficiary; clarity formulation – are used as indicators of the implementation of *Perka* (Table 2).

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 1** Stakeholder categories

| Primary stakeholders | Secondary stakeholders |
|---|---|
| Procurement committee | Central government |
| Government contracting agency | Local government |
| PPP team | Financial institutions |
| Business entity | Law enforcement officer |
| Guarantee agency | National/international agency |
| | Auditor |
| | Preparation consultant |

Source: adopted and modified from stakeholder model Freeman et al. (2007)

For the calculation of the index of perception of this survey a Likert scale was used, from the answer "Strongly Disagree" to "Strongly Agree." Then, for analysis, the weighting for satisfaction (Appropriate) and dissatisfaction (Inappropriate) were grouped into two categories (Table 3).

## Research Parameters

To optimize the study of stakeholders to *Perka*, the approach of the Knowledge, Attitude, and Practice (KAP) study was used. WHO (2008) says KAP survey as "a representative study of a specific population to collect information on what is known, believed and done in relation to a particular topic...". In this study is *Perka*. The attitude aspect of the KAP study was aimed at evaluating the behavior change of research objects; thus, in this study, the attitude was limited because the object of this study was a regulation that was intangible.

The KAP study used in this study was aimed at seeing that the perception problem of the *Perka* is

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 2** Perception indicators survey

| No. | Principles of forming good regulation | Perceptions index parameters |
|---|---|---|
| 1. | Clarity interest | *Perka* is required to manage the procurement of government goods/services that are not included in the scope of Article 2 of Presidential Decree Number 54 of 2010 and its amendment |
| 2. | Institutional or authorized/ entitled agencies | *Perka* that was issued by LKPP is implemented in accordance with the authority possessed |
| 3. | Conformity between type and material content | *Perka* has arranged the PPP procurement in a structured and systematic way |
| | | *Perka* has set requirements that must be owned by the parties involved in the PPP procurement process |
| 4. | Can be implemented | *Perka* can be implemented and become effective |
| 5. | Usefulness and beneficiary | The principles of procurement in *Perka* has pushed the achievement of results and quality of the optimal procurement |
| | | *Perka* facilitates the PPP procurement. |
| | | *Perka* encourages the use of domestic production/national business |
| | | *Perka* encourages the participation of small businesses |
| | | *Perka* promotes national economic growth |
| 6. | Clarity formulation | *Perka* is easy to understand (objectives, terminology and systematics clear); no multiple interpretations |

Source: Adopted from Law No. 12 of 2011

broader, which is to see the influence of stakeholder understanding of the *Perka* and the subsequent impact on the field of specialty for its implementation.

1. Knowledge is aimed at exploring the extent of the respondents' awareness and knowledge associated with *Perka* on the terms or related aspects. Here, the extent to which resources and or influence of LKPP (LKKP stands for *Lembaga Kebijakan Pengadaan Barang/Jasa Pemerintah* (English: National Public Procurement Agency)) socialization respondents is also seen.
2. Attitude is aimed at exploring respondents' attitudes to and perceptions of *Perka* and the juridical aspects involved, and the extent of the strength of the attitude of the respondent. For the measurement of the perception index, the indicator-forming principles described previously were used.
3. Practices are aimed at determining the respondents' behavior in favor of or involved in the implementation of *Perka*. This behavior has become part of the procurement process or recently reached the stage of awareness of values and attitudes alone.
4. Information and media factors are aimed at determining the intensity of information and media that is consumed/accessed by respondents that affects the understanding and perception, in addition to identifying the most effective media information to reach the stakeholders' target.
5. Environmental factors are aimed supporting the attitudes and behavior, either positive or negative, in influencing support for the application of *Perka* (Fig. 2).

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 3** Perception survey scale of *Perka*

| Scale | Perception of respondents | Analysis |
|---|---|---|
| 1 | Strongly disagree | Dissatisfaction (*Inappropriate*) |
| 2 | Disagree | |
| 3 | Somewhat disagree | |
| 4 | Somewhat agree | Satisfaction (*Appropriate*) |
| 5 | Agree | |
| 6 | Strongly agree | |

Source: Likert scale modified from Sugiyono (2010)

The third aspect of the KAP study can be explored and tested using statistical analysis. In

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Fig. 2** Knowledge, Attitude, and Practice study Source: adopted and modified from Verstraelen et al. (2006).

addition to deepening, related matters can be explored as follows:

1. The main parameter index measurement using the parameters in a previous study by improving the question structure and distinguishing between *Perka*.
2. Additional information is limited by the priority, the adequacy of the question, and limitations in the survey.
3. Each index parameter and additional information are tailored to the criteria of stakeholders. Index parameters, policies, and additional information not experienced by or related to stakeholders were not requested in the questionnaire.

Questions on the understanding level or perception were measured using a Likert scale (1–6), which is easy for the public to understand (Table 4).

A specific understanding of the respondents was used. The measurement of the index can be made to facilitate the analysis and can be converted into a scale of 0–100. The results can be a percentage or a benchmark index periodically for the next survey. The Stakeholder Satisfaction Index or Category Respondents were measured by the average score (mean score) answer to the topic question as a parameter. This is because between categories of respondents, the parameters were assumed to have the same weight.

In the measurement index, there was a difference between the groups of stakeholders. The weight of the primary stakeholders' index was greater than that of the secondary stakeholders.

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 4** Likert scale survey

| Scale | Perception of respondents | Analysis |
|---|---|---|
| 1 | Strongly disagree | Dissatisfaction (*Inappropriate*) |
| 2 | Disagree | |
| 3 | Somewhat disagree | |
| 4 | Somewhat agree | Satisfaction (*Appropriate*) |
| 5 | Agree | |
| 6 | Strongly agree | |

Source: Likert scale modified from Sugiyono (2010)

The magnitude of the index weight of the primary and secondary stakeholders (60:40, 70:30, 80:20, or 90:10) was determined based on internal decisions. The weighting in this study was 60% for primary stakeholders and 40% for secondary stakeholders.

## Pre-Test Results

To examine the validity and reliability of the research instruments, testing of the questionnaire as a research instrument that will be used was carried out. In this research, the questionnaire itself functions as an instrument for obtaining information relevant to the purpose of the research and has a high level of reliability and validity. After the draft questionnaire passed the test of validity, the reliability test was then carried out. After both tests, the questionnaire was formed into a final survey.

The following stages of testing were carried out.

1. Validity test was used to test the content validity of the questionnaire questions, whether they were in accordance with the survey concept (goal), both the definition of the theoretical or literature, and the result of defining researchers and results from previous research.
2. Reliability was tested using Cronbach Alpha testing of the pre-test questionnaire.
3. The question that was tested was a question of perception index measurement, namely the question codes Q1–Q14
4. Cronbach Alpha test results against the pre-test questionnaire: Cronbach Alpha of the pre-test questionnaire survey *Perka* did not obtain significant results owing to the limited sample (four sample). Based on the pre-test survey approach, *Perka*, the points P1–P14 indicated that it was reliable or trusted as a research instrument.

## Research Findings

### Understanding of *Perka*

#### Source of Information

As has been mentioned earlier, this study involved primary and secondary stakeholders. Stakeholders said there are 3 (three) sources of information in understanding the *Perka*, namely: Training (48.5%), Direct Socialization (33.3%), and Printed Material (example: books, flyers, and so on) as many as 24.2%.

#### Adequacy of Information

Overall the number of stakeholders perceive that almost similar percentage in term of adequacy of information. 54.6% stakeholders assessed the information about *Perka* to be insufficient. 42.4% said that information about *Perka* was sufficient and only 3.0% said it was very sufficient.

#### Expected Media to Get Information on the *Perka*

In regarding of the expected media to get the information on the *Perka*, the stakeholders not only choose one media information. Stakeholders tend to choose variety of media information. 61.1% of stakeholders expected Direct Socialization of the LKPP to be media information about *Perka*. 50.0% of stakeholders expected Direct Socialization; 44.4% of stakeholders expected Printed Material; 22.2% of stakeholders expected Mass Media; and 5.6% of stakeholders expected Official Letters from government to be media information.

#### Knowledge Level on *Perka*

When identifying the level of knowledge of the major items in *Perka*, almost all stakeholders know enough. Matters concerning the stages of government cooperation with business entities were 100% understood by stakeholders. Furthermore, many respondents understand the Enterprises Procurement Executive (93.9%) and the purpose and objectives *Perka* (90.9%). Overall, each *Perka* item has been conceived by more than 50% of stakeholders; namelym the procurement organization (87.9%), values of *Perka* (81.8%), conflicts of interest (78,8%), the guarantee of jobs (75.8%), the procurement of the preparation agency (69.7%), and electronic procurement (54.5%).

### Satisfaction Perception of *Perka*

Overall, as many as 90.9% give a positive perception of stakeholders; namely, answering Agree and Strongly Agree to the points statement about *Perka*. This showed that in the perception of stakeholders, both primary and secondary, *Perka* is appropriate as regulatory support in the implementation of PPP. Although only 9.1% of stakeholders answered Agree Less or Disagree on a points statement about *Perka*, which can be seen completely in Table 5:

### Satisfaction Index of *Perka*

Satisfaction index was measured by stakeholders' agreement on good regulation aspects of *Perka*. Stakeholders rated *Perka* Satisfactory, with a score of 78.14. This shows the perception of the stakeholders, both primary and secondary, judging that *Perka* is appropriate as a

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 5** Satisfaction perception of *Perka*

| No. | Satisfaction perception of *Perka* | Percentage (inappropriate) | Percentage (appropriate) |
|---|---|---|---|
| 1. | *Perka* has set clear objectives. | 9.1% | 90.9% |
| 2. | By changing the articles, *Perka* is in conformity with the purpose of the issuance of regulations | 12.1% | 87.9% |
| 3. | *Perka* is issued pursuant to the authority possessed by the LKPP | 6.1% | 93.9% |
| 4. | The substance of *Perka* has been in accordance with the mandate *Perpres* no. 38 of 2015 on "Cooperation between the Government and Business Entities in Infrastructure Provision" | 9.1% | 90.9% |
| 5. | *Perka* is the effective benchmark in the implementation of PPP procurement in providing infrastructure | 24.2% | 75.8% |
| 6. | *Perka*: | | |
| | (a) Encourage and promote the cooperation between government and business entities in the provision of infrastructure and services based on fair business principles. | 0.0% | 100.0% |
| | (b) Realize the provision of quality, effective, and efficient infrastructure. | 6.0% | 94.0% |
| 7. | *Perka*: | | |
| | (a) Using a clear systematics | 3.0% | 97.0% |
| | (b) Using sentences that are easy to understand | 3.0% | 97.0% |
| | (c) No interpretations | 18.2% | 81.9% |
| | **Total** | **9.1%** | **90.9%** |

Source: Modified from Law No. 12 of 2011

regulatory support in the implementation of PPP (Table 6).

### Need for a Probity Advisor

Most stakeholders (87.9%) assess the need for Probity Advisor regulation in implementing business entities procurement and only 12.1% said that there was no need. Institutions most widely recommended were the Financial and Development Supervisory Agency, as much as 41.4%; LKPP, as much as 17.2%, and the rest were independent agencies or consultants.

## Conclusion

Based on the results of the data processing and analysis, a conclusion can be formulated as follows:

1. Stakeholders of *Perka* rated it Satisfactory, with a score of 78.14. This shows the perception of stakeholders, both primary and secondary, in that they said that *Perka* was appropriate

**Study of the Implementation of Indonesian Public Private Partnership Procurement Regulation, A, Table 6** Satisfaction index of *Perka*

| No. | Categories of respondents | Scale (6) | Scale 100 |
|---|---|---|---|
| | *Primary stakeholders (weight of 60%)* | | *78.47* |
| 1. | Procurement committee | 4.71 | 78.50 |
| 2. | PPP team | 4.80 | 80.00 |
| 3. | Implementing business entities | 4.50 | 75.00 |
| 4. | Enterprises bidder | 4.42 | 73.67 |
| 5. | National Financial Institutions | 4.57 | 76.17 |
| 6. | Guarantee institutions | 5.25 | 87.50 |
| | *Secondary stakeholders (weight of 40%)* | | *77.63* |
| 7. | Government/regulator | 4.36 | 72.67 |
| 8. | National institutions/ institutions/organizations | 4.35 | 72.50 |
| 9. | International institutions/ institutions/organizations | 4.50 | 75.00 |
| 10. | Consultant | 4.53 | 75.50 |
| 11. | Auditor | 5.55 | 92.50 |
| | Index Total | | *78.14* |

Source: adopted and modified from stakeholder model Freeman et al. (2007)

as a regulatory support in the implementation PPP.

2. Sources of information about *Perka* were insufficient; thus, there was the need to increase the diversity of media and information content. Thus, stakeholders expected that Direct Socialization, On LIne Media, and Printed Material (example: books, flyers, and so on) as sources of information.
3. The content of Perka that is assumed unclear by stakeholder is:
   (a) *Perka* is the effective benchmark in the procurement of implementing business entities for the provision of infrastructure (24.2%)
   (b) *Perka* was perceived to still have multiple interpretations (18.2%).
4. If a Probity Adviser is needed, it can be a new norm to be added into the new *Perpres* or *Perka* revision.

**Acknowledgment** Thank you to Lembaga Pengelola Dana Pendidikan (LPDP) for providing scholarship and to LKPP for providing data.

# Subgovernmentalism and Parallel Bureaucracies Within a State

Amir Forouharfar
Department of Public Administration, University of Sistan and Baluchestan, Zahedan, Iran

## Synonyms

Bureaucratic redundancy; Clandestine/hidden government(s); Cryptocracy; Deep state; Invisible government; Parallel bureaucracy; Secret government; Shadow government; Shadowy government; State within a state; Unofficial government

## Definition

Subgovernmentalism (sub-, beneath, under; government, official representatives at the executive branch in charge of public affairs' administration, supervision, regulation, and direction; -ism, condition, practice, manner) is any formation of unofficially bureaucratic powers where

secretive, shadow, and redundant executive powers emerge and interfere with the official duties and responsibilities of a state's official government/executive branch.

## Introduction

At least from the eighteenth century onward – the Age of Enlightenment – the concepts of power distribution and its decentralization have been emerged in political philosophy. Montesquieu, a French judge and political philosopher of the Age, proposed his concept of political power distribution among a state's principal entities or branches, as we call them today. This view of political power distribution is now so common and prevailing that approximately all the current states have adopted a system of power distribution which is called the "tripartite system," and it indicates distribution of political power among the executive, the legislative, and the judicial branches. This is to avoid any centralized unaccountable political power within a state, to prevent any potential power usurpation, and to make a condition of official power parallelism not only within a state but also among its de jure (based on laws; lawful) branches. However, always there is a possibility of mega- or large-scale bureaucratic power formations, which would not be recognized officially and usually pursue their intentions and goals secretively in reluctance to the national interests. If these islands of independent bureaucratic powers with their own bureaucracies interfere with the main, de jure, and officially recognized state's government – as the sole executive branch – then the result will be numerous policymaking outlets and prevention of sound governance. Metaphorically, the formation of a rival or multiple bureaucratic entity(s) that interrupt the normal functioning of the executive branch is analogous to the tumors in the governmental body. They gradually degrade, destabilize, and corrupt a political system and its governance. Therefore, there is a necessity for any student of administrative science to become familiar with the concept and the characteristics of subgovernmentalism.

## Subgovernmentalism as Subsystem Politics

Subgovernmentalism is an instance of subsystem politics. Subsystem politics is a phenomenon in the intrastate political atmosphere (Freeman and Stevens 1987). The term "subsystem" here indicates political relations among the influential entities in the policy areas that embrace various organizations and institutions in a larger system (Ibid.). For example the triangular relationship among the interest groups, the Congress, and the state bureaucracy could lead to an "iron triangle" which tries to fulfill the legislature's or the interest groups' interests but not the public. According to Forouharfar (2019), the case in point is an example of subgovernmentalism's iron triangle (Fig. 1); i.e., a situation that the complicated reciprocal relationship among some state entities makes an inescapable condition that inherently prioritizes the entities' interests' fulfillment over the public interests.

Roe (2013) places subgovernmentalism among a range of policy models from policy network to cabinet government. However, the usage of the term "subgovernmentalism" in this entry does not indicate a legal model for policymaking or, in overall, state administration. Thus, in order to have a clear mental image of subgovernmentalism, first it would be beneficial to get familiar with its characteristics.

### Subgovernmentalism Characteristics

Subgovernmentalism as a bureaucratic phenomenon could have one, some, or all of the following characteristics or results:

**Subgovernmentalism and Parallel Bureaucracies Within a State, Fig. 1** Subgovernmentalism's iron triangle. (Source: Initially, Freeman and Stevens' (1987) idea, modified by Forouharfar 2019)

1. It is usually unconstitutional, that is, its formation is not legally recognized in the constitution of most countries. However, there are some political systems that have some jurisprudential entities within their constitutions that are incongruous with the separation of power and distribution of political power among the executive, the legislative, and the judicial branches. If a constitution presumes an unaccountable power above or beyond the three branches, then always there is a possibility of subgovernmentalism formation.
2. It makes one or more parallel bureaucracy (s) within a state. Therefore, in the least case the state will be administered with a binary bureaucracy and in the worst case with multiple conflicting bureaucracies. The results are bureaucratic redundancy, overbureaucratization, and violation of the axiomatic rule in management: unity of command.
3. It is secretive and hence leads to shadow government, i.e., a non-publicly elected government that deals with covert activities to fulfill the self-interests of its members or its top entities. Therefore, its formation, members, and mechanisms are clandestine, and the members usually prioritize their own interests at the expense of violating the public and national interests.
4. It could constitute a deep state, i.e., a state within a state. Such a condition is using the bureaucratic facilities and posts of the official and legitimate government in order to make a bureaucratic coalition for nepotism (favoring relatives), cronyism (appointing political associates to official posts without considering their qualifications), connection, favoritism (showing special and exclusive favor toward someone or some group), and promotion of personal or collusive goals without respecting the consent of the governed, and hence it is illegitimate.
5. It could potentially lead to a cryptocracy (crypto-, hidden; -cracy, form of government) that is a form of hidden government with unknown bureaucrats pursuing clandestine goals in shadow.
6. It could have kleptocratic intentions and lead to a kleptocracy (klepto-, stealing; -cracy, form of government), that is, a form of unaccountable government with a bureaucracy in service of corrupt leaders and officials in pursuit of stealing national, local, or regional resources and facilities.
7. It is destructive and usually could lead to the interruption of sound administration of the public and the state and in severe cases would end in irreparable damages to the public and the state.

Then, the phenomenon could be classified based on the area(s) that it takes place.

## Subgovernmentalism Typology

At least there are three major types of subgovernmentalism:

1. One of the branches in the form of subgovernmentalism, i.e., the legislative or the judicial branches, is meddling with the state or the public executive affairs and procedures to the extent that they continually violate the national constitution of state or interrupt the government's autonomy. This type of subgovernmentalism could be called Branch Subgovernmentalism.
2. One of the agencies or departments or divisions of the official branches in the constitution (e.g., the executive, the legislative, and the judicial branches) covertly or obviously interferes with the executive affairs of the public or the state or encroaches on the duties of another branch's agency, department, or division. This type of subgovernmentalism according to the meddling entity could be called Agency Subgovernmentalism, Department Subgovernmentalism, or Division Subgovernmentalism.
3. The secretive and illegal coalition of bureaucratic entities from numerous branches, departments, agencies, public corporations, etc. in a state to usurp, violate, or take advantage of political power or pursue the coalition's self-interests via the state bureaucratic power. This type of subgovernmentalism could be

called Coalition Subgovernmentalism, and it is a very severe type of the phenomenon which originates from the cataclysmic corruption of the state's bureaucrats and its entities.

### Examples of the Subgovernmentalism Types

To elaborate the subgovernmentalism typology – presented above – the following broad examples are provided:

1. Branch Subgovernmentalism, e.g., the judicial branch interference in state's executive affairs
2. Agency Subgovernmentalism, e.g., the intelligence agencies covert meddling in state affairs
3. Department Subgovernmentalism, e.g., the defense department or military entities exertion of power in the affairs that are not assigned as their legal duties and responsibilities in the state laws
4. Division Subgovernmentalism, e.g., one of the administrative divisions or local governments in a federal state violates the collective rights of all the other states or territorial divisions in order to pursue its own divisional interests.
5. Coalition Subgovernmentalism, e.g., the horizontal coalition among some bureaucrats in the executive branch with some influential entities in another branch such as the legislative branch in order, for example, to violate, conceal, exempt, or promote, rules, embezzlement, accountability, or a scandal, respectively

### Some Potential Consequences of Subgovernmentalism

1. Emergence of parallel bureaucracies, since a bureaucratic structure in one branch, department, division, state entity, or governmental body acts in parallel with the de jure (lawful) executive organization officially in charge of the administration of the specific affair(s). The least result of parallel bureaucracies is multiple sources of de facto (actual although illegal) executive powers.
2. Intensification of bureaucratic corruption.
3. Endangering national and public interests.
4. Degradation of official/national government.
5. Expansion of "gray zone" of politics (i.e., secretive connections between state powerful actors and collective violence perpetrators (Auyero 2013); also subgovernmentalism could take the form of a "gray zone" conflict, i.e., taking advantage of national or subnational power entities and instruments via a complicated and obscure war with the intention of gaining specific and previously strategically defined objectives beneath the threshold of military war (Hoffman 2016).
6. Diminishing executive accountability.
7. Expansion of nepotism.
8. Expansion of favoritism.
9. Diminishing meritocracy.
10. Organization and formation of conspiracies.
11. Expansion of unethical politics.
12. Dominance of the state's bureaucrats who are aware of the pivotal state information on economy, politics, plans, etc. (taking advantage of information rents, i.e., the informational advantage that a governmental agent has acquired).
13. Formation of secret coalitions in the bureaucratic entities of the state.
14. Expansion of informal politics such as cronyism (appointment of the friends or associates to political posts).
15. Diminishing transparency in state affairs.
16. Intervention of military personnel in the state politics.

## Conclusion

Generally, subgovernmentalism indicates any furtive, shadow, and redundant bureaucracy or bureaucratically stemmed power in the politics or administration of the state or the public, which acts secretively, and within complicated coalitions or bureaucratic networks in shadow. Hence, the political and administrative science scholars have used some familiar and frequently used terms and phrases to explain different dimensions of the phenomenon such as a deep state, a shadow government, a hidden government, a state within a state, etc. Moreover, one of the logical outcomes of the increase in subgovernmentalism is the emergence of bureaucratic parallelism, which is a redundancy of bureaucracy once there is no need for such illegal

and secretive bureaucratization that usually feeds from the legal authorities' political or bureaucratic powers but for the fulfillment of unknown or hidden stakeholders' self-interests at the expense of violating the public and national interests. Furthermore, there are some potential consequences to subgovernmentalism including but not limited to bureaucratic corruption, gray zone politics, national government degradation, public interests violation, executive accountability reduction, favoritism and nepotism increase, meritocracy decadence, conspiracy formation, unethical politics expansion, information rent abuse, secret coalitions formation, cronyism expansion, transparency decrease, and military personnel intervention in the politics of the state. Moreover, in a broad classification, there are three possible types of subgovernmentalism: (1) Branch Subgovernmentalism, (2) Agency/Department/Division Subgovernmentalism, and (3) Coalition Subgovernmentalism. The justification for the abovementioned classification is classifying subgovernmentalism by its place of manifestation. Finally, the existence or emergence of subgovernmentalism and its mentioned pathological symptoms within a state or governmental body indicate an afflicted body that needs urgent cure through a systemic treatment originated from systems thinking (i.e., a holistic approach in analyzing the problems, which deals with the whole not the single constituent of the system).

# Subjective Globalization

Richard J. Sutcliffe
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Synonyms

Cultural globalization; Global imaginary; Globality; Globalization

## Definition

Subjective globalization refers to the impact of globalizing processes on the human subject across political, cultural, and psychological domains in diverse sociocultural contexts.

## Introduction

The emergence of subjective globalization is a response to the overemphasis on material processes and transformations characteristic of conceptualizations of globalization. Subjective globalization is linked to the cultural dimensions of globalizing processes.

Globalization is a well-established theme in contemporary social scientific research and in academic and public discourses. The correlative notion of the global connectedness of human lives and social interrelationships has been broadly disseminated. Much of this has concentrated on the

material-objective (e.g., economic, technological) dimensions of globalizing processes rather than the subjective dynamics of transnational flows as these impact on the reshaping of identities and the "subjective plane of human consciousness" (Steger 2013: 15; Steger and James 2011: 53). Questions concerning the lived experience of globalization, including consciousness of the world as a single place (or *globality*), and on the reconfiguration of subjective experience within local contexts of social life remain underdeveloped concerns within the field of global studies (but see Kennedy 2010; Steger and James 2013).

The significance of trans-local horizons was recognized in the early 1990s (and earlier) by sociologists such as Robertson (1992), Beck (1992), and Giddens (1990, 1994). Critic Fredric Jameson asks, "How can culture and subjectivity not be transformed when opened to the vicissitudes of this vaster landscape and population which is globalization itself?" (Jameson 2015: 128–129).

This article focuses on the interrelated concepts of "subjective globalization" and "globality." It is essential to stress at the outset that this is an emerging domain of inquiry. Accordingly, a coherent theoretical framework and the elaboration of a shared methodological approach for research into subjective globalization remain desiderata. Outlined here is a preliminary survey of theoretical perspectives informing research into subjective globalization that highlights the key contributions to the literature while resisting the North Atlantic metropolitan bias of globalization discourse.

## Discourses of Globalization

The phenomena associated with the concept of *globalization*, and the concept itself, have received substantial attention over the last three decades. Kelly notes that the concept of globalization has acquired a global currency, "circulating through complex networks formed by multilateral institutions, broadcast, print and electronic media, academic exchange and the self-reflexive analysis of…'soft' or 'virtual' capitalism" (Kelly 1999: 380). Schäfer emphasizes the transcultural dimensions of globalization discourse (Schäfer 2007: 2). Although there are prefigurations in sociological writings from the 1960s, and in world systems theory, the term first emerges clearly in economic discourse (business journalism).

Through its expanded usage, and multiplicity of articulations, globalization has also become a radically contested notion. These contestations are closely connected to normative judgments about the "global" and "globalizing processes" and their major transformative force in shaping the contemporary world. Substantive disputation also occurs over how to define globalization. For example, which social processes and structural transformations are most salient for understanding its dynamics? Challenges to globalization also come from grassroots activism, indigenous political movements, environmentalist- and identity-based politics, transnational networks, and the institutional expansion of global civil society that coalesce broadly as "alter-globalization" movements.

Central to most conceptions of globalization is the idea of the intensifying and deepening integration, interdependency, interactivity, and increasing interconnectedness of the world as a whole. This points to the profoundly spatial dimensions of globalization in terms of both the processes involved and also as implied by the concept-metaphor itself. The technologically mediated compression of space enables the experience of the world as one place to be both more tangible and a constitutive horizon of social action, widely distributed among the global human population. These ideas are captured in one minimalist sociological definition of globalization as "the process by which the world is said to become a single space; globalization may be seen as the compression of space" (Abercrombie et al. 2006: 167).

What is novel in *subjective* globalization studies is the explicit thematizing of the subjective dimensions of this deepening interconnectedness and the ways in which the compressed "global world" is imagined. At the same time, new questions arise concerning actual experiences of globality. Specifically, "How can we document

and measure global reflexivity and consciousness?" (Schäfer 2007: 7). More generally, "How can we better understand globalization's powerful subjective dynamics?" (Steger and James 2011: 56).

## Globalization: Material Processes and Cultural Dimensions

The concept of subjective globalization has grown out of the increasing recognition of the significance of the cultural dimensions of globalizing processes, a theme that has been emphasized particularly in anthropological and sociological theorizing and research (and also in cultural and media studies).

In these terms, then, globalizing processes can be regarded as transcending purely economic changes and expanding to encompass widespread social and cultural transformations. This has important implications for understanding the relationship between cultural-subjective imaginaries and globalizing processes, opening also onto the recognition, "largely missing in the burgeoning globalization literature. . .of how various ideological articulations of the phenomenon have shaped its material designs and instantiations" (Steger and James 2011: 53). One of the key potentials of subjective globalization studies is their privileging of cultural-subjective imaginaries as a window onto the large-scale processes currently transforming human lives on a global scale. They also take seriously the need to engage in critical analysis of the strategies of representation mobilized by elite global actors within powerful institutional contexts (Steger 2013: 109). The nexus between these two dimensions is underlined by Steger's observation that "market globalism consists of powerful narratives that sell an overarching neoliberal worldview, thereby creating collective meanings and shaping people's identities" (ibid.: 117). Moore has also argued for a more reflexive approach that pays attention to the various contexts of globalization because particular "ways of conceptualizing the world bring about material consequences, and drive change" (Moore 2013: 4). Particularly significant is Moore's emphasis on "[both] the theories that social theorists put forward, and the kind of relationships they have with the theories of ordinary people" (ibid.).

The study of globalization as a radically inter- or transdisciplinary enterprise is further reflected in the emergence of global studies as a new field of research. Distinctive contexts and modes of globalization include economic globalization and the globalization of politics, law and norms, culture(s), religion, and sexualities. These domains reflect academic tendencies that distinguish broadly between the economic, political, and cultural aspects of globalization. Kelly suggests however that "the grouping together of economic, cultural, political and other spheres must surely also reflect the erosion of disciplinary boundaries in the social sciences and humanities, so that there is a growing sense of the interconnection of different spheres" (Kelly 1999: 380). Among recent analyses, Steger's is notable for its systematic coherence and distinguishes five main domains of globalization: economic, political, cultural, ecological, and ideological (Steger 2013).

The concept of globalization can be understood as encompassing phenomena ranging from worldwide economic restructuring to transformations of consciousness and subjectivity. That is, "globalization is best thought of as a multidimensional set of objective *and* subjective processes that resists confinement to any single thematic framework" (Steger 2013: xii). From a geographical perspective, these processes involve complex, uneven, and asymmetric transformations in the social production of scale and of socio-spatial power relations (Smith 1996; Kelly 1999; Short 2001; Amin 2002; Flew 2009). Despite recognition of the contestations over the meanings of globalization within academic and media discourse, relatively little research has been conducted into the meanings of globalization as represented in public imaginations and as constituted in everyday contexts of social life and identity formation (Moore 2013; Kennedy 2007, 2010). Consequently, inadequate attention has been paid to systematic conceptual theorizing about the cultural-subjective dimensions of globalization.

## Cultural-Subjective Dimensions of Globalization

Research that has explored the cultural-subjective dimensions of globalization is notably absent from the neoliberal economic doctrines that have been globalized through powerful international intergovernmental institutions, such as the IMF, and does not play a significant part in economic and financial analyses of globalizing processes (cf. Mazower 2012: 353–354). Economic definitions of globalization tend not to include any reference to politics or culture and may be so basic as simply to reference the "geographic dispersal" of the provision of goods and services. Nevertheless, both the complexity of global cultural flows and the significance of culture in mediating and shaping the dense interconnectivities and situated interactivities between global forces and local life-worlds have been strongly articulated in social scientific and cultural studies in recent decades (Hannerz 1992; Friedman 1994, 2002; Featherstone 1995; Appadurai 1996; Jameson and Miyoshi 1998; Kennedy 2007, 2010; Steger 2013: 74–86). Indeed, Steger observes that the "exploding network of cultural interconnections and interdependencies in the last decades has led some commentators to suggest that cultural practices lie at the very heart of contemporary globalization" (Steger 2013: 74). From this vantage, *cultural globalization* refers to "the intensification and expansion of cultural flows across the globe" (Steger 2013: 74).

Cultural globalization facilitated through technological innovation enables not only the increased integration of global flows of financial capital through world markets but also intensified interconnections between people through communications networks and the expansion of mediatized cultural flows on a planetary scale (Castells 1996–1998; Cohen and Kennedy 2007; Steger 2013). The possible impacts and consequences of an emergent global media culture on the relative autonomy and diversity of local contexts of social life have also become key elements within debates about globalization (Hannerz 1992; Tomlinson 1999; Flew 2009). Further ramifications are the density of interrelations in any specific global-local nexus, the complexities of evolving infrastructural spaces, and the asymmetries and disjunctures of cultural flows within the "global social organization of meaning" (Hannerz 1992: 219; cf. Cohen and Kennedy 2007: 49; Easterling 2014). These global cultural flows impact upon the lived contexts of human social life. Steger maintains that the "dominant symbolic meaning systems of our age. . .circulate more freely and widely than ever before. As images and ideas can be more easily and rapidly transmitted from one place to another, they profoundly impact the way people experience their everyday lives" (Steger 2013: 75). However, the other side of this process, stressed particularly in much anthropological and media studies research, is that people in local contexts interact with and reshape these global flows in the very processes of their reception, appropriation, and consumption. Hannerz has made this point forcefully, positing that arguments about the impact of the transnational cultural flow "would have to say something about how people respond to it. . . [t]he meaning of the transnational cultural flow is thus in the eye of the beholder: what he [or she] sees, *we generally know little about*" (Hannerz 1992: 243, emphasis added).

The problem of subjective globalization in contemporary global studies has its roots in the sociological approach to globalization developed by Robertson (1992). Here, problems of culture and consciousness are foregrounded as central to the study of globalization. For Robertson, both the *compression of the world* and the *intensification of consciousness* of the world characterize the global field (Robertson 1992: 8). He asserts, "[in] an increasingly globalized world there is a heightening of civilizational, societal, ethnic, regional and, indeed individual, self-consciousness" (ibid.: 27). The *compression of the world* and the *intensification of consciousness* are intrinsic to each other: each incorporating objective *and* subjective dimensions of globalization.

Robertson's term for the social condition in which globalizing processes are dominant is "globality." This is a complex notion, which to a certain extent is the marker of subjective globalization, leading some sociologists to appropriate

Robertson's terms to distinguish between globalization (objective) and globality (subjective). In Robertson's usage, however, the interrelationship would seem to be more complex (globalization has subjective dimensions and globality can be an objective condition). Robertson has recently reaffirmed this subtle interrelationship by indicating that both terms share the same essential characteristics: "The two most general features of the condition of globality are the same as those of globalization: widespread connectivity (or interconnectedness) and global consciousness" (Robertson 2007: 524). For Robertson, it is *the interrelationship of consciousness and world* that must be the primary basis for theorizing globalization. He thus introduced the distinction between *objective* and *subjective* globalization as a twofold process involving the compression of the world and the intensification of consciousness of the world as a whole (Robertson 1992: 8, 9).

At this level of abstraction, the world as a whole is at the core of subjective globalization. The thematization of the world as a whole (as a single place) as an increasingly significant aspect of contemporary consciousness and, moreover, the reflexive awareness of this situation of "globality" are posited as a context and horizon informing the thoughts and actions of social actors (Robertson 1992, 2001; Robertson and Inglis 2004). Steger suggests that "[w]ithout erasing local and national attachments, the compression of the world into a single place has increasingly made [the] global the frame of reference for human thought and action" (Steger 2013: 15). Yates refers to globality as "…a growing consciousness of both the world as a single place…and humanity as a single people" (Yates 2009: 7). Developing upon this idea of world consciousness, scholars have more recently begun to theorize the emergence of a "global imaginary" and the "globalization of the world picture" (Steger 2008, 2013; Yates 2009), as well as opening new questions concerning the phenomenon of "subjective globalization" as an irreducible dimension of contemporary social life on a planetary scale (cf. Robertson 1992: 9; Steger and James 2011, 2013; Steger 2013). As defined by Steger, the concept of a global imaginary refers to "people's growing consciousness of global connectivity" (Steger 2013: 10). This "thickening of the global consciousness destabilizes and unsettles the conventional nation-state within which people imagine their communal existence" (ibid.: 10–11). This dimension of globalizing processes has however received relatively little attention in academic and popular literature and urgently requires further research (but see Friedman 2002: 294).

## Approaches to Subjective Globalization

The most systematic approach to subjective globalization to date is that developed by Steger and James (Steger and James 2011, 2013). These authors follow Robertson's distinction between the "objective" and "subjective" dimensions of globalization (Steger and James 2013). Noting that the majority of research and publication energy around globalization has been devoted to the "objective phenomena of globalization," they set out to develop an analytical framework for approaching its subjective dimensions. This framework moves from ideologies, through imaginaries, to ontologies, all of which are understood as dimensions of lived consciousness and of subjective globalization (Steger and James 2011). Each is conceived as successively deeper than the previous level. Descending through each level, ideas, meanings, sensibilities, and subjectivities are contested (ideologies), felt (imaginaries), and embodied (ontologies) (ibid.: 56). Ideologies express underlying social imaginaries, which are in turn structured by more foundational ontologies that articulate the basic categories and structures of being. With each increase in depth, from ideologies through ontologies, the dynamics of transformation take place at a slower rate. In other words, there is more rapid variation at the surface level. Various ideologies express a "rising" global imaginary (one among others) that "rides" on a "slow-moving" ontology.

At the level of ideologies, Steger and James identify four kinds of "globalism": market globalism (which is hegemonic), justice globalism, religious globalisms, and imperial globalism.

Underlying these various globalisms is a constituent social imaginary that articulates a "convocation of the social whole," i.e., the *global imaginary* (Steger and James 2013: 30–32). This is described as "a generalizing, deep-seated imaginary of global connectedness" (Steger and James 2011: 60). Thus, although there are important variations in the different ideological globalisms, they rest on a shared global imaginary and, ultimately, are based on similar ways of imagining the world. For Steger and James, the global imaginary can be understood in contrast to other (and earlier) forms of the social imaginary, such as the nationalist imaginaries of the nation-state, and dominant modern political imaginaries (e.g., liberalism, socialism). In contrast to the national social imaginaries, with their characteristic ties to territorial space and identity formations, the global imaginary (that has been emergent for several decades) emphasizes increasing global interconnectedness. At the still deeper level of ontologies, Steger and James argue that the global social imaginary is structured by modern conceptions of space, time, embodiment, and performance (Steger and James 2011, 2013).

The most striking (and theoretically innovative) element in the Steger and James framework is this conception of the global imaginary, which draws upon Steger's earlier work on modern political imaginaries (Steger 2008). Steger and James graphically depict the global imaginary as erupting "with increasing frequency within and onto the familiar framework of the national, spewing its fiery lava across all geographical scales. . .this global imaginary destabilizes the grand political ideologies codified by social elites during the national age" (Steger and James 2013: 33). In this way, they hold that the internalization of the global imaginary has consequences for identity formation and that "our changing ideational landscape is intimately related to the forces of globalization" (ibid.).

Political subjectivization is central to Steger and James' theorization of the subjective dimensions of globalization. Their focus on subject position finds an echo in earlier globalization literature (e.g., Hay and Marsh 2000). Writing at the turn of the millennium, Hay and Marsh argued that the study of globalization was marked by an excessive focus on structures and processes and a corresponding neglect of subject position and agency (Hay and Marsh 2000). This tended to reify globalizing processes as transcending the sphere of human agency. Accordingly, they argue that it is necessary to include the subject position in the deconstructive analysis of the structuration of globalization (ibid.: 13–14; see also Poppi 1997).

The concept of subjective globalization opens into other, perhaps unexpected, arenas and potential avenues of research. For example, recent literature on globalization, culture, and psychology has focused explicitly on the way that globalizing processes impact on senses of the self and formations of identity (e.g., Melluish 2014). A recent issue of the *International Review of Psychiatry* sought to highlight the relative lack of attention to the relationship between globalization and psychology (see Tribe and Melluish 2014). Melluish seeks to clarify the "psychological and cultural dimensions of globalization" while inquiring into "how people around the world are impacted by it" (Melluish 2014: 538). In this context, globalization is understood primarily in relation to the themes of increasing interconnectedness, the shifting of social processes from nationality to globality, the centrality of power relations, and the issue of relative power asymmetries. This points to a link between subjective globalization and the findings of more psychologically oriented research into the lived impacts of global political economy.

Moore's analysis of the "global" as a concept-metaphor in anthropology (Moore 2003) also opens up research possibilities into subjective globalization. Her analysis positions the "global" as a trope or figure that does conceptual (cognitive-affective) work, not merely in academic theorization but also in the ways that "ordinary people" deploy it in their "imagined and engaged worlds" (ibid.). In more recent work, Moore argues that some of globalization theory's conceptual antinomies and binary classifications are misleading for research into local contexts and moreover that their superimposition can mask new and creative patterns of social relations and

forms of cultural production that are taking shape and structured through new forms of desire and satisfaction. Moore considers that analysis of such new forms (desires, satisfactions) should focus on the specificity of patterns of connections and relations as they are "lived, imagined, maintained, and transformed" (Moore 2013: 9). Taking the example of Indonesian fashion designers, she argues that while they understand themselves as interconnected global citizens, their vision is premised on "exploring affective and cognitive dispositions" and the "possibilities their connected world offers" for creating "new connections, new meanings, novel forms of relation" (ibid.).

A further approach is offered by Scholte (2002), who advocates taking greater account of the nature of social space and the globalizing of *transplanetary* and *supraterritorial* connections between people. This is necessary to challenge the tendency of globalization discourse to identify globalization with already recognized and understood concepts such as internationalization, liberalization, universalization, and westernization. For Scholte, these approaches lead to cul-de-sacs since they do not adequately grasp what is genuinely new in contemporary globalizing processes. While transplanetary "connectivity" has a long history, supraterritorial social relations are radically novel forms of social interconnection that "transcend territorial geography" and involve the condition of globality "in the sense of the world as a single social space" (ibid.: 17, 15). In this new world-as-a-whole view, the "global sphere" becomes "a social space in its own right" (Scholte 2002: 15).

## Potential Challenges for Subjective Globalization Studies

These promising approaches to subjective globalization and globality have been greeted by several cautionary caveats. First, Terry Flew, a media and communications specialist, has criticized globalization discourse around the "global media cultures thesis" arguing that this typically overstates both the influence of world media in various national contexts and the extent to which the largest media corporations actually constitute TNCs [i.e., their respective "degree of transnationality" (p. 5)] (Flew 2009). Flew also questions the metaphor of a scalar shift (from discrete national medias to a global mediascape dominated by a few transnational media corporations), suggesting that this assumption is not borne out by empirical research. He thus argues for a nuanced approach to the "relational dimensions of socio-spatial change" (ibid.: 4). This approach emphasizes the ways that "geographical locations can become 'clusters of overlapping network sites'. . .where there is an interlocking of activities across multiple planes of the global, the national, the regional and the local" (ibid.: 4–5). Flew proposes that globalization should be conceived in relational rather than scalar terms (ibid.: 4, 11). Eschewing the linear move from local to national to global, Flew underlines the mutually constitutive transformations of scale and scalar relations, ". . .that link to complex cultural and economic geographies of place" (Flew 2009: 11; cf. Amin 2002; Conti and Giaccaria 1998).

Given that Steger's theorization of the rising global imaginary is tied to a version of the global media culture thesis (e.g., Steger 2013: 82), as outlined above, Flew's critique of global media studies forms a critical supplement indicating the need for more refined conceptualizations of the multi-scalar relations involved in the production and consumption of mediatized cultural flows. If the "rise of the global imaginary is inextricably connected to the rise of the global media" (Steger 2013: 82), then future research on the globalization of experience and consciousness would do well to take account of Flew's call for greater attention to the spatial complexity of socio-spatial transformations including the role that geographical perspectives may play in the analysis of these (Flew 2009).

If recent research has tended to emphasize the unevenness, heterogeneity, plurality, and non-linearity of globalizing processes, it is necessary also to take seriously Moore's contention that it is "one of the paradoxes of globalization that it is not global. It exists as a partial condition that has no teleology of completion and cannot do so" (Moore 2013: 3). This has important implications

for the theorization of globality because it implies the partial and uneven distribution of the global imaginary as a horizon that both informs social action and structures multi-scalar relational networks of social interconnectedness (cf. Friedman 2002).

From a very different perspective, Schäfer has embraced a partial and non-teleological conception of globality and proposes a program for "lean globality studies" (as a "diagnostic tool to gauge how far given processes of globalization have spread in space and time") (Schäfer 2007: 6). Arguing that there has been a tendency to overload the meaning of globality, Schäfer both scales down and pluralizes the concept while placing it in a comparative-historical civilizational framework. He argues that "[r]esearch-oriented globality studies are served best if the conception of globality remains simple" (ibid.). Crucially, lean globality studies "do not require globality to be fully global" (Schäfer 2007: 7). This also implies that "globality is not coextensive with worldwide" (ibid.: 3). Moreover, Schäfer argues that full globality of the entire human world is unlikely to occur (ibid.). Accordingly, he asserts that we should not assume that globality is a singular condition; rather, *globalities* are plural and local: "One can speak about the globality of a city, nation, or region; and since there are many cities, nations, and regions, globalities are *plural*, *comparable*, and *measurable* and *historical*" (ibid.: 1, 7, emphasis added).

In this perspective, there is no single process of globalization. There are numerous individual globalizations with spatiotemporal limits that can be gauged (in terms of both historical trajectories and geographical range). Globalizations involve spatial expansions that "involve more of the globe," and research could focus accordingly on "agents and factors that increase the *geographical range* of things" (Schäfer 2007: 4). Globalizing processes have taken a variety of forms throughout human history. They unfold at hugely varying rates, each with "their particular dimensions and temporal dynamics; they are profoundly plural, spatial, historical, and uneven" (ibid.). The trajectories of recent globalizing processes constitute an "increasing confluence of globalizations" (ibid.). For Schäfer, globalities emerge from globalizations, each being "the local outcome of one or many processes of globalization" (ibid.: 5). This presence of one or more processes of globalization becomes the basic criteria of the minimal conception of globality (ibid.).

Schäfer thus proposes the heuristic assumption that the "globality of language, city, nation, or region is a local condition that can be determined" (ibid.: 7–8). On the basis of a critical review of earlier discussions of globality, he establishes a conception of globality as a local condition with four components: (1) one or more globalizations, (2) a geographical range, (3) a state of interconnectedness, and (4) a state of consciousness (ibid.: 5–7). These components also form the methodological basis for formulating sets of researchable problems that Schäfer suggests can reveal "the state of global consciousness – the reflexivity-dimension of globality – [which thus] becomes available for critical analyses and historical interpretations" (ibid.).

Schäfer's proposals for lean globality studies and the "local concept of globality" have significant implications for the study of subjective globalization. They seem to radically deflate conceptions of globality based on the total-set assumption. Schäfer's globalities are not complete, universal, worldwide, or singular. Significantly, however, this conceptualization of globalities does retain the dimensions of relative world consciousness and degree of interconnectedness, which Robertson originally ascribed to globality (Robertson 1992, 2007). This reduction of scales that the term globality implies is accompanied by the regionalization of the concept which radically pluralizes globalities across times and scales. This adds further complexity to globality as an object of research, and to the scope of global studies, by multiplying the contexts into which research exploring the degree and extent of globality could be pursued. Schäfer's theoretical outline of methodological research into globality is potentially useful here for further research design.

A further cautionary voice in the field of research into globality and subjective globalization is that of Kennedy, a sociologist, whose study

*Local Lives and Global Transformations* (Kennedy 2010) is one of the most detailed and sustained analyses of the meanings of global interconnectivities for various social actors. Taking as its main theme the contention that "people continue to live local lives despite, and perhaps partly because, of globalization," Kennedy finds "the continuing power and appeal of the local in the lives of most people in the face of globalizing processes" (Kennedy 2010: 27, 255, cf. 2007). This argument for the resiliency of the local implies both a relativizing critique of the hegemony of the global and a call for globalization theory to centralize the local, highlight the role of micro-actors, and draw on empirical research to confront ideal-typical models (ibid.: 7). Kennedy does not disregard the significance of global forces that impact local lives. He notes that we are already living global lives at the local scale, our fate bound up with "innumerable" others, despite "vast distances, cultural barriers and territorial boundaries" (ibid.: 3). He maintains however that there is a radical disjuncture between this objective situation and a tendency for people to be "unable or unwilling to act as if these globalizing processes and interdependencies affected us" (ibid.). This final point is the nub of Kennedy's contribution.

It is not possible to follow Kennedy's detailed and substantive arguments any further here. But two aspects of his work can be emphasized. The first is the resiliency of the local. The second is Kennedy's treatment of the concept of globality. This diverges from the minimalist approach to globality proposed by Schäfer (*supra*), seeking instead to "flesh out" the concept and focusing on certain of its dimensions, such as the cosmopolitan themes of the world as a single entity and the shared predicament of humanity as a single species facing globalized issues and risks (Kennedy 2010: 1–5; cf. Robertson 1992). Kennedy thus incorporates a concept of globality that takes up Robertson's theme of the emergence of a reflexive world society that could take action for itself (Kennedy 2010: 2–5, 15, 19).

Kennedy's analysis contains much that is instructive for the study of subjective globalization. His empirical research and nuanced theorizations of the phenomenological density of the everyday lived experience of local lives are significant. He also underlines the need for circumspection with regard to overenthusiastic proclamations regarding the scale and distribution of globality as a substantive horizon of experience for the majority of the world's people. It is however the empirical grounding of Kennedy's arguments that is most instructive for research into subjective globalization. Kennedy argues that "we need to take more account of how ordinary social actors perceive and experience globalization from 'below' rather than relying solely or mainly on academic theorizing which tends to overstate the impact of globalization on most people's lives" (Kennedy 2010: 7). By confronting social theory with concrete lived experience in this way, Kennedy's work bridges the sociology-anthropology nexus and opens a further window onto the micro-macro interrelations of globalizing processes. His work suggests a way to sharpen the focus of global studies. More specifically, he argues that it is insufficient to demonstrate the facticity of global interconnectivity as a horizon for social action in the absence of thick description that shows how people's attitudes toward it reveals regard or concern for that horizon.

## Conclusion

The emerging core problematic of subjective globalization and globality is a still largely open space awaiting well-focused research into these emergent dimensions of human social life in the early twenty-first century. Between the empirically grounded caution of Kennedy's argument that most people still inhabit predominantly local contexts of social life, and Steger's enthusiastic discernment of the rising global imaginary, there is considerable scope for more detail and refinement in understandings of the multi-scalar dimensions and densities of social interrelationships in the contemporary world. With this, too, arises the possibility of developing clearer understandings of the impacts of some of these transformations on the subjective dimensions of human social life in a differentially and unevenly interconnected world.

# Supergovernmentalism and Parallel Global Bureaucracies over a State

Amir Forouharfar
Department of Public Administration,
University of Sistan and Baluchestan,
Zahedan, Iran

## Synonyms

Global bureaucracy; Global bureaucratic hegemony; Global bureaucratic power; Global governing body; Global influence; Superstate

## Definition

The implicit or explicit exertion of power from global organizations and superior global governments as superpowers that are able to enforce their will upon national governments that consequently leads to diminishing administrative and decision-making powers of the domestic governments.

## Introduction

*Supergovernmentalism* is a compound noun in politico-governmental discussions.

The prefix "super-" indicates dominancy, over and above. In addition, *governmentalism* is either "1. A theory advocating extension of the sphere and degree of government activity; [or] 2. The tendency toward extension of the role of government" (Merriam-Webster's Collegiate Dictionary 2002, p. 504) with its first known usage in English language that dates back to approximately 1841–1848. The second shade of meaning constitutes the concept in *supergovernmentalism*. That is, in combination (super- + -governmentalism), the term indicates any dominant – e.g., administrative, regulatory, policymaking, decision-making, etc. – superpower over the domestic government's power, which could violate national autonomy and national will embodied in a government. Nevertheless, *supergovernment* is broadly "a governing body that has power over other governments" (On-line Merriam-Webster's Dictionary 2019). Furthermore, its connotative meaning has dramatically changed from its first usage in 1911 to the present era of global bodies' dominance. If in the early to the mid-twentieth century supergovernment was usually embodied in the imperial superpowers before and after the two World Wars (I and II), the political arena and the formation of global entities such as the *United Nations* (UN) and its subsidiaries, besides some truly gigantic organizations in size, bureaucracy, and scope of operation such as *International Monetary Fund* (IMF), *World Trade Organization* (WTO), *European Central Bank* (ECB), etc., attributed new connotations – i.e., the feeling the term invokes – and indications to the term. The current usage of the term *supergovernment* induces feelings of global hegemony and influence. Even though some global organizations can impose their will on domestic governments, the phenomenon of supergovernmentalism does not always have a dark side. The establishment of the UN on 26 June 1945 was one of the greatest supergovernmental incidents in human history to compensate the vacuum of a unanimous global power which could have the consent of all members based on its Charter (Chapter 1, Article 1): "to maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to the peace, and for the suppression of acts of aggression or other breaches of the peace . . ." (UN 2019a). Hence, some global supervisory bodies such as the UN's entities for the protection of human rights (e.g., the *Human Rights Committee* and its *Centre for Civil and Political Rights*, CCPR) could have positive pressure over the suppressive governments that are violating their citizens' human rights. Therefore, broadly based on the domestic governments' type (i.e., autocratic or democratic), and their behaviors, the reactions to *supergovernmentalism* were either positive or negative.

## Globalization and Bureaucrcay

Globalization has had plethora of effects, influences, deformations, and reformations. Culture, politics, economy, environment, society, etc. had been the vast arenas of globalization evolutionary drive. However, the spirit and essence of administration, in other words bureaucracy, is also affected by the humongous force of globalization. However, the public who live day in, day out under these bureaucracies are not aware of the burden of global bureaucracies originated from the global bodies over their states. Metaphorically, bureaucracy could be seen as a living entity that lives in two large environments: the internal environment, which is a state's domestic government, and the external environments, which are global and supergovernmental entities. *Supergovernmentalism* is an effective phenomenon, which exists out of the borders of any state but could have tangible effects inside a state. A familiar example is an *Interstate System* such as the *European Union* (EU) that inevitably enforces some bureaucracies over the member states to govern, administer, and arrange the interstate affairs. There are plenty reasons for justifying the need for such umbrella states. The most important function of them is the need for global order. The devastating incidents of World Wars I and II catalyzed the necessity of the formation of supergovernmental entities as umbrella powers to be able to manage, regulate, supervise, administer, and in critical situations to react to the belligerent intrastate acts.

Thus, to know this ubiquitous global phenomenon, first we should know what its tangible and practical characteristics (functions) are, then how it emerges, and after that how it makes numerous vertical bureaucracies over a domestic bureaucracy that leads to global bureaucratization and finally get familiar with a pathological view of the phenomenon.

## Functional Characteristics of Supergovernmentalism

1. Acts as a superstate, i.e., as an extremely powerful governing body that subordinates, subjugates, or encourages cooperation among the underlying states. *Intergovernmental organization* (IGO) is a familiar example for *supergovernmentalism* acting as a superstate that is constituted around an agreed charter on issues of common interest; e.g., the *North Atlantic Treaty Organization* (NATO), the *Organization of the Petroleum Exporting Countries* (OPEC), and the *European Union* (EU). Such IGOs are always the result of an international treaty; otherwise, they are not recognized as an IGO in the international law (Harvard Law School 2019). The functional role of *supergovernmentalism* as a superstate constitutes one of the pillars of *Global Governance* (i.e., a modern phenomenon originated from the governance in the context of globalization that encompasses not only the administration and governance of transnational organizations but also the global-scale rules and laws designated for the facilitation and demarcation of international cooperation).
2. Exerts power through global governing bodies, that is, *supergovernmentalism* is globally considered legitimate as far as it is exerted via a globally accepted organization (e.g., the UN or in the case of more aggressive decisions or actions via the *UN Security Council* (UNSC)).
3. Potentially could function as an apparatus of global hegemony, in other words *supergovernmentalism* could lead to a preponderant influence in international relations and violate the autonomy, integrity, and independency of the states. Setting aside the urgency or the contingency for humanitarian causes, the incidents such as military interventions by intranational organizations or coalitions are the manifestations of *supergovernmentalism's* hegemonic function (e.g., on 17 March 2011 amid the rise of the Arab Spring, a NATO-led coalition started a military invasion to oust the Libyan dictator *Muammar Gaddafi*, and it ended on 31 October 2011 with his death).
4. Forms a global bureaucratic power, i.e., the superdominant bureaucracy of any supergovernmental entity could influence its bureaucratic power over the inferior states' bureaucracies. Broadly, by the emergence of

any supergovernmental body, its concepts of supergovernmental administration and hence supergovernmental bureaucracy that preside over the inferior governments/states emerge. To safeguard the sovereignty of member states against the super-bureaucratic function of *supergovernmentalism*, the globally governing bodies could condition the acceptance of their recommendations or resolutions originated from their organs with "the principle of sovereign equality" and the consent of the member states. For example, "…the United Nations was based on the principle of sovereign equality and, therefore, could, not be considered a "super-State" or "super-Government", it followed that its Members could not be bound by the resolutions or recommendations of its organs, save in certain exceptional and well-founded cases. Decisions could be binding only when taken in connexion with the maintenance of peace and security or in grave cases where Member States had consented to accept the necessary limitations concerning the exercise of their sovereignty; recommendations, on the other hand, were never binding" (UN Charter, Chapter 4, Article 10, p. 222).

5. Fosters global bureaucracies, i.e., supergovernmental bodies in charge of the administration of global affairs make their own bureaucracies relevant to the special issues they are going to deal with them. These IGOs usually organize their bureaucracies within their main organs in respect to their predefined missions and objectives (e.g., UN has six main organs. Five of them – the *General Assembly*, the *Economic and Social Council*, the *Security Council*, the *Secretariat*, and the *Trusteeship Council* – are based at UN Headquarters in New York. The sixth organ, the *International Court of Justice*, is located in the Netherlands).
6. Takes the shape of global influence, in other words, it is hard to imagine a superstate and not to consider its potential influences. The global influence in *supergovernmentalism* especially emerges with the pursuit of unilateralism (i.e., an idea, action, or policy that supports one-sided, nonparticipatory mannerism) especially in international affairs. Global regulatory power is one of the areas for *supergovernmentalism* influence. It usually emerges in the framework of "unilateral regulatory measures" (e.g., "… the European Union exerts considerable influence over worldwide markets through its regulatory and legal framework," Bradford 2013).

## How Does the Supergovernmentalism Emerge?

Different cases of supergovernmental entities – although they prefer to be called IGOs – have their own justifications not to be ascribed as a "superstate." For example, the UN Charter (Chapter 4, Article 10, p. 222) claims that it is not either a "state" – since it does not have the duties of a state – or a "superstate" (UN 2019b). However, "if the General Assembly could decide by a two-thirds majority to impose financial obligations on Member States, even on those which did not accept such obligations, it would indeed be a 'super-State'" (Ibid.). This situation clearly reveals one of the usual mechanisms that *supergovernmentalism* takes shape. Other mechanisms, which lead to the phenomenon, are mentioned in the following:

1. The globalization spirit itself and its unprecedented political, economic, social, etc. issues and problems in the global arena justify the advent of supergovernmental organizations.
2. Global dependency, i.e., the technical, economic, political, etc. dependencies among the member states or in the global scene, is another deep cause for *supergovernmentalism* (e.g., the *World Trade Organization* (WTO) or the *Organisation for Economic Cooperation and Development* (OECD)).
3. Global supervision, i.e., the need for supervision in plethora of global issues, was another reason for the emergence of supervisory supergovernmental bodies (e.g., the *Financial Action Task Force on Money Laundering* (FATF), the *International Organization of Securities Commissions* (IOSCO) for global investment, or supervising global human rights

violation, e.g., the UN committees (*Committee against Torture* (CAT), the *Committee on Economic, Social and Cultural Rights* (CESCR), the *Committee on the Rights of the Child* (CRC), the *Committee on the Elimination of Racial Discrimination* (CERD), etc.))

4. Global regulation: The need for global regulatory governance and global administrative laws has helped the emergence of supergovernmental regulatory entities (Kingsbury and Stewart 2008).
5. Global cooperation: Some global organizations such as the *Food and Agriculture Organization of the United Nations* (FAO), the *International Labour Organization* (ILO), the *International Monetary Fund* (IMF), and the *International Telecommunication Union* (ITU) have defined globally cooperative missions as the justifications for their establishment. The premise behind the justifications is the overwhelming conditions of global issues in the current world, which call for the cooperation of most of the states and their synergy for tackling them.
6. Global consultation and assistance: There are some global bodies, which assist the states to promote their global commitments (e.g., the *UN Office of the High Commissioner for Human Rights* assists governments to implement and fulfill human rights obligations and protection).

## How Does *Supergovernmentalism* Make Numerous Parallel Bureaucracies over a Domestic Bureaucracy?

Once a superstate governing entity emerges for the regulatory, supervisory, cooperative, etc. intentions, it definitely needs to devise, establish, and expand its own bureaucracy based on the predefined missions for that entity. Therefore, it is impossible to have the concepts of *Global Governance* and *Global Administration* without assuming the bureaucracies, which are necessary for the promotion of those governance and administration. In addition, by the expansion of the global governing entity either through operational diversification, i.e., varying its operations; complexity intensification, i.e., adding or differentiating its special activities or geographical branches/bureaus; and decentralization, i.e., transferring authority of decision-making from central and single administrative entity to local bureaus, myriads of super-bureaucracies emerge that may interfere or meddle with the domestic bureaucracies within the member states. To clarify the concept, the examples of *International Monetary Fund* (IMF) and the *World Bank* (WB) are two cases in point. There are plenty of researches and claims that their obscure global policies for the reduction of poverty and their policy imposition among the financial and monetary decision-making sections of state bureaucracies of the member states have generated plenty of economic wreckages and social problems and led to the support of dictatorships (Toussaint 2019).

Finally, pathologically the main threat of *supergovernmentalism* forms once a tripartite play emerges among a domestic government, the global entities, and the internal interest groups or in some cases the internal shadow government. It could make a situation that is "Supergovernmentalism Iron Triangle" (Forouharfar 2019). In this triangular condition, the domestic government under a global obligation – e.g., as a result of borrowed loan from the global financial institutions and the commitment to implement specific economic policies – inadvertently forgets the public interests and tries either to pursue the interests of the global entities or the internal interests of some groups or even the shadow government (Fig. 1).

**Supergovernmentalism and Parallel Global Bureaucracies over a State, Fig. 1** Supergovernmentalism Iron Triangle. (Source: Forouharfar 2019)

## Conclusion

*Supergovernmentalism* as a global bureaucratic phenomenon was described with its functionary manifestations: (1) superstate function, (2) power exertion function, (3) global hegemony function, (4) bureaucratic power function, (5) global bureaucracy fostering function, and (6) global influence function. Later the causal reasons for its emergence in the global arena were mentioned as (1) the globalization spirit, (2) global dependency, (3) global supervision, (4) global regulation, (5) global cooperation, and (6) global consultation and assistance. After that, the process of global bureaucratization via *supergovernmentalism* was discussed as the need for professional bureaucracies to administer the global regulatory, supervisory, cooperative, etc. intentions, which inherently lead to the establishment and expansion of the bureaucracies over member states based on the predefined missions of the global governing entities.

## Synonyms

Coordination; Drug delivery; Procurement; Supply chain management

## Definitions

| | |
|---|---|
| Coordination | Managing interdependencies between activities performed to achieve a goal. In the supply chain context, coordination can be viewed as an act of properly combining a number of objects (actions, objectives, decisions, information, knowledge, and funds) for the achievement of the chain goal. |
| Supply chain management | Management of flow of inventory, information, and money between the different members of a supply chain. |

## Introduction

Efficient and effective supply chains are critical to ensure timely supply and distribution of malaria drugs from supplier to the point of dispensing. The drugs are commonly known as Artemisinin-Based Combination Therapies (ACTs). These are the most affordable effective options to treat uncomplicated malaria in many Sub-Saharan countries, where widespread malarial parasite resistances to medicines are rife (Khera and Mukherjee 2019).

Supply chain management in a hospital setting creates value by providing excellent customer service through: procuring right goods, in the right quantity, delivered to the right place, at the right time, for the right cost, and to the right clients. Hospitals are the first referral points after the lower health centers and are in the downstream chain where actual delivery of the health service takes place. Dobrzykowski et al. (2014) observe that hospitals are still some of the major weak points in the healthcare supply chain management, despite the fact that they offer a big number of outpatient and inpatient services. In addition, they provide supervisory support to lower-level health facilities and maintain linkages with communities through community health departments.

Sub-Saharan Africa is very prone to malaria and attendant medicine shortages. Deliberate efforts have been made by several governments to reduce the malaria trends over the past decades. However, such efficiency is absent in terms of deliberate intervention alone. According to the United States Agency International Development, Centers for Disease Control and Prevention (2018), malaria is the leading cause of death in Uganda, accounting for over 27% deaths in the country. Therefore, availability of medicines, a crucial element of universal health coverage as per Sustainable Development Goal 3, is critical so as to curb this epidemic. Progress in regard to this goal is not happening fast enough since at least half of the global population does not have access to essential malarial drugs. However, achieving it presents a significant challenge, especially in low-income countries. Despite several interventions focusing on preventive and therapeutic approaches, malaria has remained one of the oldest and deadliest diseases of mankind in Africa (World Health Organization 2019). Currently, international efforts focus on malaria eradication by 2050, through roll outing new technologies and substantial growth in the political and financial commitment by countries, regions, and their global partners especially in Africa. However, before this ambitious plan is attained, the supply and distribution of ACTs must be efficient.

In Uganda, malaria is the leading human killer, especially among children under 5 years and expectant or pregnant mothers (Uganda Bureau of Statistics and ICF 2017). The same report shows that in Uganda, malaria kills around 350 children every day. Malaria is the main cause of infant mortality; it causes underweight and premature births. One out of every two children is admitted to the hospital due to malaria. This has had far-reaching negative consequences on the populace, especially patients' lives, including death. Similarly, the National Planning Authority – Uganda (2015) reports that in spite of the significant investments in malaria control, the malaria burden remains high, with rampant stock-outs of ACTs. There is unavailability, understocking, and or overstocking of ACTs in some hospitals. The growing importance of curbing malaria disease in the developing world seeks for possible solutions on making available best efficient drugs (ACTs). Availing medicines to the masses can easily be done by efficient supply chain for malarial drugs, particularly ACTs.

## Medicine Supply Chain in Uganda

Availability of medicine in health facilities is substantial to quality health care. In developing countries, where budgets for medicines are often tight, the supply chain needs to be well-managed to prevent all types of wastage, including pilferage, misuse, and expiry. This wastage reduces the quantity of medicines available to patients and, therefore, the quality of health care they receive. Still, reinforcement of service delivery in the health sector is not without complications,

especially given the many stakeholders in the sector. It necessitates a delicate balance of competing interests of the multiple stakeholders. Governments are in most cases faced with the challenge of developing current models for decision-making that cater for the divergent views of the various players across the supply chain, while maintaining the desired quality of medicines.

This largely led to the development of the National Health Policy in Uganda to inform the national development framework. This commits the government to deliver a package of essential interventions commonly referred to as the National Minimum Health Care Package (NMHCP). Most of these interventions depend on essential medicines, which necessitate having efficient supply chain coordination. Therefore, it attracts considerable efforts from international organizations, local nongovernmental organizations (NGOs), and government agencies to provide medical supplies to the sick populace.

Furthermore, the National Medicines Policy (NMP) aims at contributing to the attainment of a good standard of health of the population of Uganda, through ensuring the availability, accessibility, and affordability at all times of essential medicines of appropriate quality, safety, and efficacy and by promoting their rational use. Realization of the NMP aspiration continues to be challenging because of multiple factors. It is important, therefore, to have a systematic method for coordinating the supply chain of medicines. Uganda faces the barriers to affordability and accessibility of appropriateness in the use of malarial medicines. In the same regard, it is also regrettable that empirical interventions to improve the availability of medicines in Uganda to reduce eventual mortality rates have also not yet succeeded, as the applied frameworks are perceived to be notably inept (Uganda Bureau of Statistics and ICF 2017). To overcome this challenge, the government of Uganda put in place the National Medical Stores (NMS) through an Act of parliament to procure, warehouse, and distribute essential medicines and medical supplies primarily to public hospitals and other lower-level health facilities.

In terms of supply and distribution of medicines, the supply chain starts with individual hospitals that place procurement plans and orders with the National Medical Stores (NMS), which is responsible for delivering all medicines and supplies to all public health facilities on a bimonthly distribution schedule. Under the new pull system utilized by the NMS, all health facilities are supposed to have Drugs Therapeutic Committees, mandated to plan, forecast, aggregate requirements, procure, store, and dispense medical supplies. Despite such empirical efforts, poor management of interdependent multifaceted relationships between personnel in health facilities, Ministry of Health, donors, local governments, and NMS has further complicated the supply and distribution problem. The distribution of medical supplies to user units represents a key component of the hospital's internal supply chain. Large quantities of medical supplies are replenished on a daily basis. In Uganda, the methods of distributing supplies to nursing units can be classified according to whether decisions regarding the quantities to be replenished are centralized in the pharmacy department or decentralized in the nursing units themselves, based on established reordering policies. Given the complexity of the units involved, coordination is important.

## Supply Chain Coordination and Its Dimensions

The ACTs supply chain involves integrating key business processes to end-users through original suppliers. The chain comprises interdependent units within a firm and across units that belong to both downstream and upstream partners. Given the nature of the interdependence between units, coordination is a necessary prerequisite to integrate their operations to achieve the mutual goal of the supply chain as a whole as well as those of its units. Coordination of activities between units becomes important as firms focus on their core activities and outsource the rest. Thus, their success increasingly depends on their ability to coordinate their internal and external activities in the

value chain. Supply chain coordination encompasses every effort of identifying the tasks and dimensions such as information exchange and integration during the course of developing, producing, and delivering a product or service to end-users. In reality, the objectives and interests of different members along a supply chain are diverse and conflicting. Thus, supply chain coordination becomes so vital to the achievement of all-level consensus, through which different members along the supply chain can react to market requirements in highly congruent ways.

These members are dependent on each other to effectively transfer goods and information among themselves. However, a member's self-interest and myopic view of supply chain may lead the supply chain member to focus exclusively on their own goal. This self-interest of a member may hurt the performance of the other supply chain members and may result in degraded overall performance of the supply chain. For an efficient supply chain, it is expected that the supply chain members behave coherently to achieve a common goal. The centralized control of the supply chain assures efficient coordination but it may not be realistic. In a decentralized control, the supply chain members optimize local decisions without considering the impact of their decisions on the other members' performance and on the overall performance of the supply chain. Thus, top management commitment may be necessary to motivate the members to achieve coordination. Supply chain members are dependent on one another and these members need to be coordinated by efficiently managing dependencies among them. Soroor et al. (2009) conceptualized supply chain coordination to have the dimensions of responsibility interdependence, uncertainty, and inter-functional conflict. This relies on the availability of prompt and accurate information that is visible to all actors in the supply chain. Therefore, the dependencies between the supply chain members can be managed with the help of coordination mechanisms such as invoking supply chain contracts, information sharing, information technology, collaborative decision-making, meetings with supply chain members, and technical support. Therefore to appreciate the supply chain of malaria medicine, the theoretical underpinning is necessary as discussed in the subsequent section.

## Theoretical Viewpoint

The entry advocates for a multitheoretical approach to explain supply chain coordination: activity domain theory (Taxén 2011), resource dependency theory (Heath and Sommerfeldt 2014), and coordination theory (Malone and Crowston 1994). These theories serve as a reference point for articulating the theoretical perspectives of the construct of supply chain coordination in a Sub-Saharan African setting. The activity domain theory suggests that various actors should have a common meaning when coordinating activities. The theory looks at each activity as an empire which needs to be coordinated through networks of various actors with different mandates in each node to achieve the intended needs and motives of the activity. In Uganda, the medicine supply chain starts with individual hospitals that forecast, quantify, plan, procure and place orders with NMS, which is responsible for delivering all medicines and supplies to all public health facilities on a bimonthly distribution schedule. Accordingly, it explains the modes of coordination among chain actor. This is achieved through understanding coordination as a complex result of tool-mediated interactions, which bridges the gap between the individual subject and the social reality. It further enables one to identify emergent objects within and between systems, hence reconciling the essentials of nondynamic activity systems and recognizes interdependencies. In this regard, from the health care perspective, the supply chain denotes the flow of information, supplies, and finances involved in the acquisition and movement of goods and services from the supplier to the end-user. Typically, the hospital supply chain includes the internal chain (patient care units, hospital warehouse, patients, etc.), while the external chain consists of distributors, vendors, and manufacturers. Hospitals are bolstered by a range of healthcare supply

chain management activities such as forecasting, quantification, procurement, storage, and dispensing. Improving the efficiency of these activities can provide opportunities for health care institutions and health systems to increase the quality of care and improve medicine availability.

The resource-dependency theory (RDT) proposes that institutions are coalitions which alter their structures and patterns of behavior to acquire and maintain needed external resources. This is aimed at reducing environmental interdependence and uncertainty. The main premise of RDT is that firms will seek to reduce uncertainty and manage dependence by purposely structuring their exchange relationships by means of formal or informal linkages with other organizations – in this case, suppliers. Informal linkages include negotiated environments and inter-organizational arrangements that allow companies to handle environmental uncertainty and inter-organizational dependence. Therefore, hospital administrations should focus more on developing efficient feedback systems such as regular and frequent meetings and enhance the policy of redistribution both internally and externally, other than having stocks at one center which people cannot access. At the same time, NMS should draft easier ways of making deliveries during emergencies from the regional centers. Due to unavailability of real-time point of consumption data, bullwhip effects may occur along the hospital supply chains. Therefore, partners should try to ensure that supply and distribution information is available to all stakeholders and suppliers, which in turn helps in managing service delivery to the last hospital unit, inventory, and medicine quality.

Coordination theory posits that every organization must continually identify tasks with their interdependencies (referred to as coordination dimensions) among the different actors. It presupposes that coordinating the supply chain is a critical element that ensures that all activities are systematically glued together for the achievement of joint supply chain performance. This calls for deconstructing the supply chains to ensure timely supply and distribution of medicines (ACTs) from suppliers to the point of dispensing. This theory emphasizes balancing the different conflicting goals and interests of politicians, health workers, patients, and citizens. The Ugandan government often faces the dilemma of designing new appropriate decision-making models that balance the interests of the different supply chain players without compromising quality standards through policy shifts. The purpose of coordination is to collectively achieve goals that individual actors cannot meet, which is applicable in the supply of medicines by NMS to the Uganda citizenry. The implication is that at the national level, NMS must coordinate the procurement, warehousing, and distribution of ACTs up to the last mile. While the hospitals administration coordinate the internal hospital units either through a decentralized pharmaceutical department or decentralized to specific units who later account for the dispensing of the medicines.

## Conclusion

This entry contributes to philosophy by applying: activity domain, resource dependency, and coordination theoretical lenses to explain supply chain coordination using the case of the NMS. This case provides a theoretical guide for the efficient coordination of medical suppliers particularly from National Medical Stores to the end-users. Through this study, researchers conclude that the Ugandan masses are failing to attain maximum benefit from government medicines due to inefficient supply chain coordination. This is demonstrated in a multiembedded supply chain of ACTs that is weak or inappropriately distributed. On the basis of this, the authors believe that planning a better medical flow of medicines from NMS to the end-users is vital. It is necessary to realize the need and put in place an improved mechanism of delivering medicines from the NMS to the populace and optimize public resources.

# Supreme Court and Public Administration

Amy M. Magnus
University of California, Irvine, CA, USA

## Synonyms

Government; Implementation of law; Judicial decision-making

## Definition

Supreme Court: The US Supreme Court is the highest court within the US government. The court has nine justices appointed to lifelong terms by the President, which must also be approved by the US Senate. This court hears and reviews state case decisions that pertain to federal law in which an appeal is filed.

## Introduction

What is and should be the role of the US Supreme Court? What particular "services" does the Supreme Court provide? How do Supreme Court decisions in the name of "service" become executed on the ground? The US Supreme Court is a decision-making entity, and public administrators are some of the people who implement Supreme Court decisions. This entry articulates the relationship between these two entities and makes the case that the two are naturally intertwined but also face various challenges in achieving justice through writing and implementing legislation.

The term "public administration" is multifaceted. Generally, there are four definitions that represent the conceptions of public administration: political, legal, managerial, and occupational (Shafritz et al. 2016). Various academic disciplines interpret public administration in a political and/or legal frame when considering the implementation of US Supreme Court decisions. However, it is often discussed throughout the social science and socio-legal literatures in terms of the managerialization of justice and the occupations that individuals pursue to fulfill public administration initiatives (Shafritz et al. 2016). The managerialization of justice refers to public administration as part of a bureaucracy rather than a social service, treating the administration of justice as a structured entity with managers, employees, and consumers. In this vein, this paper presents foundational explanations for public administration situated within a more critical view of Supreme Court decisions and laws relating to social inequality and the challenges associated with their implementation.

## Overview of American Public Administration

Woodrow Wilson prompted one of the first conversations about the study of government entities and their decisions (Wilson 1887). Following Wilson's argument for the formalization of public administration, Leonard White wrote the first public administration textbook, which greatly influenced the field in the following decades. A major contribution of White's (1926) work is the articulation of public administration's primary tenets. Essentially, public administration is the implementation of policies, programs, and regulations enacted by the US government. This process often occurs by way of individuals filling occupational roles within organizations and institutions, human resources within employment settings, public resource management and allocation, and policy analysis (Shafritz et al. 2016; White 1926). Within the last century, however, public administration has taken on multiple identities including "government in action," a recognized profession, and an academic field of study (Shafritz et al. 2016; White 1926).

Four primary conceptualizations of public administration have persisted over time, including political, legal, managerial, and occupational. Political definitions state that public administration "is what government does" (Shafritz et al. 2016: 7–12). In essence, the political frame for public administration argues that government is a macrostructural force (an abstract or physical overarching institution/organization in society) that governs through policy. Legal definitions refer to public administration as "law-in-action," "regulation," and the giving of services and resources on behalf of the government through legislation and policy (12–16). Managerial definitions view public administration through a business management lens for the structures within lawmaking and implementation, seeing administration as a way of enforcing the decisions and mandates of the government (19). Finally, occupational definitions refer to the profession/employment category of "administrator" as well as the academic field. These four modes of conceptualizing public administration paint with a broad brush the many facets of public administration at work and the interdisciplinarity needed to address each conceptualization.

Public administration is an interdisciplinary entity, tapping into the realms of law, political science, business, and management, with some attention also paid to disciplines like criminology, social work, economics, and medicine. Scholarship within the academic field of public administration finds that interdisciplinarity is naturally interwoven within the practice and is vital for understanding the complex social problems that public administrators face at the organizational and individual levels (Willems 2016; Metzger 2014; Meek 2008; Meek and Newell 2005). One of these complex social problems includes social inequality and discrimination, and with this comes the implementation of higher level decisions from the US Supreme Court designed to address this social problem, such as the Civil Rights Act of 1964 and its proceeding amendments, like the Equal Employment Opportunity Act of 1972. Examining the relationship between US Supreme Court decisions and public administration has been a priority of public administration, socio-legal, and political science scholars alike. Bridging these disciplines, literatures on governance and the managerialization of law present a more concrete understanding of "government in action."

## The Role of Governance: Costs and Benefits of a Managerial Versus Political or Legal Frame in Public Administration

The multiple definitions and conceptualizations of how public administration should function under the rulings of the US Supreme Court allows for much interpretation of the law and how decisions should be implemented. Managerialism is one way to conceptualize the role of government and its relationship with public administration. Rooted in the tenets of organization theory, public administration has an organizational and institutional role within the larger landscape of the American legal system. Organization theory can be described as follows: (1) Organizations serve

"production-related" purposes and aim to achieve "economic goals," (2) "Systematic, scientific inquiry" is the most effective way to be productive, (3) "Production is maximized through specialization and division of labor," and (4) "People and organizations act in accordance with rational economic principles" (Shafritz et al. 2016: 236). More recent scholarship has expanded and even questioned this notion (Liesbet and Gary 2003; Lynn 2001). This recent scholarship argues that while organizations do serve these originally theorized purposes, they should also serve the people and work to ensure that the needs of both the organizations and citizens are met. Thinking of public administration in this frame aligns more closely with how it is perceived today – public administrators act on behalf of the larger justice system to serve the system as well as the people. However, scholarly debates regarding the gap between the law-on-the-books and the law-in-action find mixed results regarding the effectiveness of a managerial framework in the administration of justice (Wright et al. 2012; Liesbet and Gary 2003). Unlike the political and legal frames of public administration, the managerial frame treats public administration as a product of the market society rather than a pro-social civil service. Here, there is room for slippage between public administrators' roles in implementing social equity legislation while simultaneously working under a managerial framework. This phenomenon may help explain part of the gap that exists between the law-on-the-books and the law-in-action.

## US Supreme Court Decisions: Administrative Implementation and Social Equality

The US Supreme Court holds the unique power of deciding on legal quandaries and social problems that come before the bench. These decisions hold much authority in the American legal system and set the ultimate precedent for all other court decisions within the country. One subset of these quandaries heard by the US Supreme Court involves questions about social equity, or rather, "the principle that each citizen, regardless of economic resources or personal traits, deserves and has a right to be given equal treatment by the political system" (Shafritz et al. 2016: 454). This notion is, of course, the golden standard. Many lived experiences in addition to academic scholarship reflect the perpetuating social inequality that still impacts American society, especially with regard to race, gender, and class. This is a serious challenge for the US Supreme Court, public administrators, and the social fabric of American society.

Movements toward social justice, particularly around civil rights, have seen multiple successes from the legislative perspective. The Civil Rights Act of 1964 is one of the most critical advances toward social equity from a "formal legal equality" standpoint (Moore 2014). However, scholars from various fields question the extent to which formalizing civil rights changes societal attitudes about race, gender, and class, for example (Moore 2014; Alger 2013; Caldwell 1999; Chavez 1996; Crenshaw 1988, 1991). Moore (2014) argues that, through Supreme Court decisions designed to ameliorate inequality, the Supreme Court reifies racial inequalities by relying solely on the letter of the law to provide equal treatment. This is not to say that Supreme Court Justices, as people, are blind to the realities and deficiencies of the American political and legal system. Moore (2014) argues, however, that decision-making occurs with an "epistemology of ignorance" about legal power, which ultimately leads to "formal legal equality" instead of actual social equality. Referencing the political and legal frames of public administration, Moore's work extends to the practice of public administration. Public administration, in all forms, faces inherent struggles with implementing Supreme Court decisions related to improving social equality in America. The extent to which formal legal equality and actual social equality can mirror one another is limited, such that the law cannot always ameliorate – and sometimes goes so far as criminalizing – individuals in society (Alexander 2012, Aziz 2012, Gustafson 2011, Han 2015, Muhammad 2010).

## Racial Injustices: Who Exactly Are "We the People"?

Thurgood Marshall, among other Justices and scholars, presents a serious critique of the United States constitution in light of the country's colonization of Native American people and its participation in slavery. *Dred Scott v. Sanford* (60 U.S. 393, 1857) was among the first of US Supreme Court cases to address issues of racial inequality in the United States (Shafritz et al. 2016). Dred Scott was a slave in Missouri but was living in Illinois (a free state) when he decided to sue the federal government for his freedom. The Supreme Court ruled that Scott was a slave, and not a citizen according to the US Constitution, and did not have a right to sue for his freedom. In this moment, and in this Supreme Court decision, it was clear that "We the People" only referred to free, white men. While the Emancipation Proclamation came only 6 years later, the legacy of racial inequality persisted throughout American history, impacting this critical Supreme Court decision and its implementation.

*Plessy v. Ferguson* (163 U.S. 537, 1896) is another example of racial inequality coming before the court. This case established that railroad facilities that were separate based on race, yet considered equal in quality, were constitutional. Although the thirteenth, fourteenth, and fifteenth constitutional amendments were in existence, issues of race and inequality were still at the forefront of Supreme Court decision-making. Similar questions were presented throughout the following century. *Brown v. Board of Education* (347 U.S. 483, 1954) established that schools separating children by race were deemed unconstitutional and brought before the court a critical question about the legacy of racial inequality. From this began a social movement toward civil rights, which initiated the Civil Rights Act of 1964 – but not without a long fight. This moment can be considered one of the first to bridge US Supreme Court decision-making, law, and public administration's role in implementing social equity legislation.

## Affirmative Action, Equal Employment Opportunity (EEO) Policies, and Intersectionality

As a result of the civil rights movement and the Civil Rights Act of 1964, two major policies/concepts emerged in an effort to implement and maintain these rights: Affirmative Action and Equal Employment Opportunity (EEO). Although enacted outside of the US Supreme Court's power, various Supreme Court decisions have built upon and refined these policies including, but not limited to, *City of Richmond v. J.A. Croson Co.* (1989), *Metro Broadcasting v. FCC* (1990), and *Fullilove v. Klutznick* (1980) (Shafritz et al. 2016). Affirmative action was originally asserted to remove racial and gendered barriers to employment. Based on affirmative action principles, Equal Employment Opportunity (EEO) programs and legislation were designed to avoid systematically or "adversely" blocking women and minorities. Affirmative action and EEO policies and programs are examples of law being placed into action with the expectation that public administrators abide by and enforce these regulations.

Crenshaw (1989) argues that law cannot adequately address inequality and discrimination, especially multiple "axes" of inequality, because of the deep-rooted history of inequality that will not be remedied by "formal legal equality." Crenshaw (1991) furthered this discussion in her theory of intersectionality, which states that inequalities and layers of identity are not independent of one another but rather interconnected and bound together. In line with Crenshaw's contributions, Best et al. (2011) present empirical work to understand the realities of intersectionality in the workplace and the protections provided by EEO legislation. This work renders support for the idea that race and gender act in conjunction with one another to create a compounded experience of discrimination in the workplace. Additionally, Best and colleagues report a decreased ability for antidiscrimination law to protect claimants when multiple inequalities exist, as they can only file under one form of discrimination – for example, racial or gender discrimination, but not both. Issues of intersectionality, coupled with the slippage between "formal legal equality" and actual

legal equality, makes implementing social equity policies challenging for public administrators.

## Conclusion

This paper began with the following questions: What is and should be the role of the US Supreme Court? What particular "services" are provided by the Supreme Court? How do Supreme Court decisions in the name of "service" become executed on the ground? Exploring multiple conceptualizations and theoretical positions about public administration and its relationship with the US Supreme Court has provided a foundation for understanding how law, like affirmative action and EEO policies, gets implemented on the ground. Rooting this entry in a lineage of social inequality and social equity legislation raises questions about the extent to which public administrators can realistically implement this legislation (Moore 2014). While the gap between law enacted by the Supreme Court/larger government and the implementation of law on the ground by administrators poses a challenge, all is not lost. No society or justice system is perfect, but the move toward equality in the law is a good first step. Public administration and the US Supreme Court have critical roles in American society, and this paper serves as an entry point into understanding those roles and their many challenges.

Employee insurance; Financial protection; Financial sustainability; Financially sustainable; Health insurance

## Introduction

Due to rapidly aging population and rising medical costs, governments in both developed and developing countries have strived to reform their health-care systems in order to finance health care in a better way. In China, the government since the mid-1980s has implemented a series of health-care financing reform to transform the free health-care system into a multilayered social health insurance system. In December 1998, the government implemented the Urban Employee Basic Medical Insurance (UEBMI) Scheme nationwide, which was a mandatory health insurance scheme requiring both employers and employees to make premium contributions. The UEBMI Scheme provides urban employees with outpatient and inpatient medical coverage. The government also implemented the New Rural Cooperative Medical System (NRCMS) for rural households in 2002, the Urban Resident Basic Medical Insurance (URBMI) for urban non-working population in 2007, and the Critical Illness Insurance Scheme for both NRCMS and URBMI participants in 2012. At present, the UEBMI Scheme is the only compulsory health insurance scheme and has the biggest number of participants in China. The implementation of the UEBMI Scheme is one of the measures to solve the problem of "difficult to see a doctor, expensive to see a doctor," which has plagued the Chinese health-care system for many years. It aims at providing urban employees with financial protection against illnesses. It can also ensure that there is a healthy workforce for continuous economic growth and prosperity.

## Free Health-Care System Before the Mid-1980s

Before the mid-1980s, China provided its population with free health care through the Labour Insurance Scheme (LIS) and the Government-funded Health Care Scheme (GHS). The LIS was implemented in 1951 to provide medical coverage for employees in state-owned and collective enterprises and their direct dependents. While the LIS covered costs of diagnosis, treatment, generic drugs, surgery, and hospitalization for eligible employees, it covered one-half of the costs of generic drugs and surgery for the direct dependents of employees. The LIS was described as an "insurance," but it was not an insurance in the real sense because it was financed by enterprises' payroll instead of premium contribution. Implemented in 1952, the GHS was financed by the state budget to cover outpatient and inpatient medical expenses for government employees and retirees; cadres; disabled military personnel; employees in cultural, educational, and health sectors; and students in colleges and universities. Before the mid-1980s, the provision of free health care was regarded as a welfare benefit to compensate for low wages in the centrally planned economy and to ensure a healthy workforce that was crucial to nation building and achieving socialism in China.

At first, free health care reduced the financial burden of both the LIS and GHS beneficiaries, improved their health status, and ensured that people had access to health care regardless of their financial means. Subsequently, however, free health care led to patients abusing medical services, which in turn increased medical costs. Meanwhile, China's transformation from a centrally planned economy to the market economy led to the government retreating from financing public hospitals. Public hospitals became responsible for generating revenues on their own. They began to run like profit organizations and charged patients more than they were required to through the overprescription of drugs, the provision of expensive or unnecessary medical treatment, surgeries, or tests. They drove up medical costs and put both the LIS and GHS under heavy strain. The eventual collapse of the LIS and GHS in the 1980s drove the government to reform the health-care financing system in order to make health care more accessible and affordable.

## Social Health Insurance System Since 1998

In the mid-1980s, local governments were encouraged by the central government to explore ways to reduce health-care expenditures, such as the out-of-pocket payment and different co-payment schemes. However, the result was not noticeable. In November 1994, the government implemented a pilot health insurance model in the cities of Zhenjiang in Jiangsu province and Jiujiang in Jiangxi province. Also known as the two-*jiang* model, this pilot health insurance model consisted of an individual Medical Savings Account (MSA) and a social pooling fund (SPF). Premium contributions were made by both the employers and employees, which in turn were split into the MSA and the SPF to pay for medical expenses of insured employees. In 1996, the two-*jiang* model was extended to 57 cities in China. Based on the local experience of implementing the two-*jiang* model, the central government decided to establish a social health insurance system to finance health care. In December 1998, the UEBMI Scheme was implemented after the promulgation of a decree known as *the Decision of the State Council Concerning the Establishment of the Urban Employee Basic Medical Insurance* (hereafter the 1998 Decree).

According to the 1998 Decree, the UEBMI Scheme was a mandatory scheme which required premium contributions from both the employers and employees in all urban work units, including the state-owned enterprises, collective enterprises, private enterprises, and foreign investment enterprises. While the employers annually contributed 6% of their total wage bills, employees annually contributed 2% of their total wage bills. Premiums were then split into the MSA and the SPF. The MSA paid for the general outpatient and emergency medical expenses and the charges for prescribed drugs of insured employees. The SPF paid for the inpatient medical expenses that were above the payment threshold or below the ceiling, with the rest paid by the UEBMI participants on their own. Meanwhile, retirees could join the UEBMI Scheme without having any premium contribution. Their medical expenses were covered by the SPF of the UEBMI Scheme. As stated in the 1998 Decree, the privilege of enjoying free health care was given to retired cadres, old Red Army, and disabled military personnel, with their medical expenses paid by the SPF of the UEBMI Scheme. To accommodate the implementation of the UEBMI Scheme, the government in 2000 issued *The Drug Formulary for National Basic Medical Insurance*, which specified essential medicines that could be partially or fully reimbursed by the UEBMI Scheme. Besides, it issued health insurance cards to all the UEBMI participants. The health insurance cards gave the UEBMI participants the right to seek medical treatment at designated medical institutions and enjoy medical coverage.

The government replaced the old LIS and GHS with the new UEBMI Scheme to finance health care of its population. The implementation of the UEBMI Scheme shows that health care is no longer a welfare benefit. Besides, it does not provide any medical coverage for the direct dependents of insured employees. But the UEBMI Scheme promotes two new ideas. The individual

MSA of the UEBMI Scheme emphasizes the new idea of individual responsibility and makes the patients more cost conscious when seeking medical treatment. Meanwhile, the SPF of the UEBMI Scheme emphasizes the new idea of social solidarity and facilitates risk pooling. Having the SPF to cover medical expenses carries the merit of reallocating funds from the healthy to the sick.

## Current Problems in the UEBMI Scheme

Since 1998, the UEBMI Scheme has become the new way of financing health care for urban employees. However, the current UEBMI Scheme contains three main problems. Firstly, the UEBMI Scheme contains the problem of inequality because it excludes the floating population, migrant workers, and temporary employees from participating in the scheme. These uninsured segments of populations have to pay out of pocket for medical expenses. Since many of them receive low salary, they may face heavy financial burden caused by seeking medical treatment. They have to borrow money from friends and relatives. They may fall into poverty or fall back to poverty due to illnesses. In order to save money, some of them do not seek medical treatment or delay seeking medical treatment. Some may practice self-medication or take leftover medicines, which can jeopardize their health.

Secondly, the problem of high medical expenses leads to a quick depletion of the UEBMI fund. Supplier-induced demand (SID) in health care is very prevalent in public hospitals in China. It occurs when doctors being motivated by their financial incentives manipulate their patients' demand for medical services. They provide the type and quantity of testing, treatment, or drugs that are beyond the patients' actual medical needs so as to earn more profits and receive more bonuses. In particular, doctors and public hospitals rely on drug sales as the main source of revenue. Due to the disorder of drug distribution system, drug prices are marked up for many times after going through the processes of drug manufacturing, wholesaling, and retailing. As the drug retailers, public hospitals are allowed to add a 15% markup over the drug wholesale price (Luk 2014). The drug retail price can be at least 30 times higher than the drug manufacturing price (Luk 2014). Unreasonably high drug prices impose heavy financial burden to both the insured and the uninsured people. In order to earn more money, many doctors favor prescribing unnecessary antibiotics or other drugs to the patients. In order to receive rebates from pharmaceutical companies, doctors in public hospitals are also incentivized to prescribe expensive medicines to patients. As a result, some patients end up paying out of pocket for drug expenses when they have used up all the money in the individual MSA or the amount of drug expenses is not covered by the SPF.

Thirdly, a substantial amount of money has been depleted in the SPF to cover the medical expenses of retirees and that of retired cadres, old Red Army, and disabled military personnel who enjoy free health care. Since the medical expenses of these groups of people are usually higher than that of working population, they drain away lots of money from the SPF. The SPF may not be financially sustainable in the long run. This put incumbent employees in a disadvantageous position because they are the main segment of population that pay premium contribution to the UEBMI but face the risk of receiving insufficient medical coverage in the future.

## Ways to Maintain the Financial Sustainability of the UEBMI System

To ensure the accessibility and affordability of health care in a context of rapidly aging population and tight fiscal constraints requires the Chinese government to make unremitting efforts to reduce drug prices and restrain the revenue-maximizing behavior of health-care providers. In order to discourage doctors in public hospitals from receiving rebates from pharmaceutical companies, the government since 2000 has implemented a centralized drug procurement system (World Health Organization 2011), which required public hospitals to purchase most of their drugs through a bidding process centralized

at the provincial level (Yang and Li 2010). Besides, public hospitals or health-care providers that are found to have overcharged patients will be financially penalized by the government, and their qualification for being an approved supplier for medical insurance will be placed in suspension status (World Health Organization 2011). The pilot zero-markup policy for drug has also been implemented since 2012 in some urban public hospitals, which does not allow public hospitals to add a 15% markup when selling drugs. But public hospitals are allowed to increase user charges and can receive subsidies from local government as compensation (Waldmeir 2015). These measures are expected to reduce drug prices through restraining the revenue-maximizing behavior of doctors and public hospitals. They help ensure that health insurance funds are used in a better way and can be financially sustainable in the long run.

## Conclusion

To conclude, the implementation of the basic medical insurance to finance health care of urban employees is better than the free health-care system because it promotes the ideas of individual responsibility and social solidarity. The URBMI Scheme can provide financial protection for urban employees against illnesses and ensure that there is a healthy workforce for continuous economic growth and prosperity. Under the circumstances of rapidly aging population and rising medical costs, the Chinese government should make unremitting efforts to maintain the financial sustainability of the UEBMI Scheme in the long run.

## Introduction

There is a growing consensus among many segments of society about the increasing importance of both sustainability and crisis management to the creation and maintenance of economically, politically, and environmentally sustainable communities at every social scale. In turn sustainability management and crisis management praxis is increasingly seen as an important collective and collaborative responsibility to be shared and practiced by all levels of government, the private sector, and individuals within an appropriate set of spheres of responsibility and scope of activities. The proposition that there is a growing consensus is borne out by a body of academic and professional literature, the efforts of the international community at the global level, and the promulgation of laws and regulations at national and local levels related to both issues. This consensus recognizes that our technologically dependent, and socially and economically interconnected world, is more prone to a wide range of risks, that the material demands of our growing global population is outstripping the regenerative capacity of

the earth's stock of natural capital, and that the actions of one set of actors has an impact (either positive or negative) on other actors which can constrain or expand their set of choices (Beck 1992; Pearson and Mitroff 1993). Mitroff (1994, p. 101) describes this emerging crisis-prone environment in which individuals, organizations, and communities must function as "global and complex and systemic."

## Sustainability and Crisis Management: Complementary Concepts

Traditionally the conceptions around, and practices related to, sustainability and crisis management were dealt with separately; however, evolving praxis is leading to a growing recognition that both issues can be enhanced by their joint consideration and that in reality these issues impact on each other in complex and systemic ways (Shrivastava 1993). A crisis is an acute event that can have long-term consequences on the sustainability of an organization, the economy, or the environment, while issues of sustainability can have profound policy, management and governance implications for business, government and the wider society that can precipitate a crisis (Starik and Kanashiro 2013). It is therefore proposed that sustainability and crisis management have many possible points of intersection: contemporary society faces a myriad of ongoing and often simultaneous social, political, cultural, moral, ethical, and environmental crises; models of economic and urban development of the past two centuries have been based on ecological assumptions that were flawed and unsustainable; and the survival of contemporary society with its complex material culture and abundant amenities depends on the continuity offered by sustainable institutions and sustainable natural ecosystems. Even if the world's population stabilized during this century, the demand for food, water, minerals, and energy will have to increase several fold just to provide basic and necessary amenities for projected population levels (Daily and Ehrlich 1992); and current methods and levels of resource extraction, resource transformation, economic production, distribution, and consumption are ecologically unsustainable and will likely lead to social and political conflict unless institutional, cultural, and technological changes are instituted (Starr 1996). The integration of the fields of sustainability and crisis management from ad hoc and fragmented disciplinary perspectives into a unified conceptual framework offers potentially fruitful avenues for unifying and reorienting praxis related to some of the most pressing issues currently facing human society. This restructured praxis will lead to more proactive, responsive, and effective government policy, more socially and environmentally responsible business practices, and greater public transparency and accountability that produces a better informed and empowered citizenry.

## Sustainability and Sustainability Management

The concept of sustainability is not settled, and there is no single, universally accepted, definition; however, there are themes that are broadly accepted that cut across disciplines and perspectives. Sustainability is an outgrowth of concerns for the natural environment, which goes back for many decades, and more recent concerns for corporate social responsibility (CSR), where organizations go beyond legal requirements and align their business models with ethical standards that advance the common good (Bowen 2013). Corporate social responsibility involves organizations recognizing that they have an impact on society – one that extends beyond the financial interests of shareholders and the consumption interests of consumers – which requires that organizations develop a relationship with a wider set of stakeholders and function in a manner consistent with the wider set of values (Elkington 1997; Coblentz 2002). Meeting the evolving expectations of a wider set of stakeholders is an attempt to build and maintain organizational reputations which are now considered valuable, intangible corporate assets. Many organizations now publish social responsibility reports, some of which are called sustainability reports, which reflects the

growing significance of sustainability as a CSR expectation.

A concept closely related to sustainability is "sustainable development" which is the integration of economic, environmental, and social considerations into a framework that recognizes the finite nature of many natural resources, limits to the regenerative and absorptive capacity of natural ecosystems, and the needs for future generations to have access to the natural capital of the planet so that they too may meet their own material needs. Sustainable development is also a contested concept, but the most frequently quoted and widely accepted definition can be found in the Report of the World Commission on Environment and Development: Our Common Future, also known as the Brundtland Report (World Commission on Environment and Development 1987). This report defined sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (World Commission on Environment and Development 1987, p. 43). This report, which has been instrumental in helping to shape the international agenda and the international community's attitude toward economic, social, and environmental development, was endorsed at United Nations Conference on Environment and Development, also known as the Earth Summit, in Rio de Janeiro in 1992. The most important of the documents approved by world leaders at the 1992 conference was *Agenda 21*, which outlined comprehensive and ambitious commitments to ensure sustainable development which would impact all sectors and levels within implementing societies. The Rio Conference gave rise in many countries to action at both the national and local levels and among public, private, and civil society actors. Sustainability management is the organizational response, through policies and practices, to these trends by creating a balance between well-functioning ecosystems, organizations, and societies (Cohen 2011).

Sustainability has normative, governance, and management dimensions (Coblentz 2002; Starik and Kanashiro 2013). The normative dimension consists of a system of values and norms held by social agents who possess a purposeful collective vision with accompanying goals, objectives, and aligned activities. These are built around adaptive institutions and processes, which serve as a framework which ensures that an organization or community has the resilience and continuity to achieve its mission and realize its vision in the face of internal and external challenges. Sustainability is also a mode of governance by which social actors can collectively interrogate existing modes of social, political, and economic organization. This serves to identify destructive practices, transform the status quo, promote the development of more sustainable patterns of economic activity, and establish a standard against which existing institutions are to be judged and held to account. Sustainability also includes a management approach which eschews short-term, myopic, and wasteful behavior in favor of constant effort, continuous improvement, and unity of purpose.

All sustainable organizations or communities require strong and balanced institutional, financial, and ethical foundations to realize their vision and mission (Coblentz 2002; Cohen 2011). Institutional sustainability requires a guiding vision – which gives a common purpose and meaning – and a mission, from which flows strategies and plans. The mission also sets the boundaries within which the organization or community will function. Institutional sustainability is related to governance and management but with a recognition that sustainability depends less on formal plans and more on flexible processes capable of adapting to evolving threats, fleeting opportunities, environmental changes, or the cognitive limits of its actors. Institutional sustainability must be supported by collectively agreed policies and procedures, which provide guidance, and systems for monitoring, evaluation, and organizational learning, which support change (Peter and Swilling 2014). Financial sustainability ensures that the human and nonhuman resources and economic incentives are present to drive the processes and activities without compromising the vision and mission (Cohen 2011). A sustainable organization knows what resources it needs, when it needs them, and from which sources – internal or external – it is able to generate these resources.

Ethical sustainability ensures that an organization or community has the requisite culture that supports stakeholders – both internal and external – working together for the common good (Cohen 2011). Organizations with strong ethical foundations will possess a positive public image, which leadership will work assiduously to build and preserve, with or without external regulation and oversight.

Achieving sustainability is a project that requires the recognition that the challenges which produce unsustainable behavior, and the policies and actions that achieve sustainability, take place in a social, economic, and environmental system that is complex and systemic (Mitroff 1994; Peter and Swilling 2014); and the term sustainability, when embedded in the concepts in complexity and systems theory, seems to generally mean the capacity to maintain, endure, and adapt (Starik and Kanashiro 2013).

Systemic implies that the challenges of sustainability arise from the structure of the system, as opposed to originating exclusively from individual agents and elements, and affect the general behavior of the entire system; and solutions to correct unsustainable behavior require deep change to a system's structure as opposed to superficial or surface solutions (Meadows and Wright 2008). Complexity implies that a system will have a network of diverse actors or elements that interact with each other, allowing the overall structure of the system itself to adapt and evolve, and produce system level, as opposed to individual level, behavior; and systems tend to have permeable boundaries, are embedded into other systems, are not isolated from their wider environment, and can therefore influence or be influenced by other systems (Meadows and Wright 2008). Thus a complex system – through its feedback loops, self-organizing ability, and adaptive capacity – exhibits emergent or unexpected behavior that can support stability and continuity (sustainability) but also produce crisis; and crisis management is one response whereby organizations try to exert control over complexity and the uncertainty that often comes with systems. Systems through their robustness, resiliency, and redundancy exhibit adaptive and regenerative capacities which support long-term survival and therefore tend toward, but are not guaranteed to achieve, sustainability. Sustainability as a systemic concept must be approached with systemic thinking where social actors acquire knowledge and learn skills that allows them to influence the system, and make necessary trade-offs, to ensure the system has the capacity to endure in a complex and continuously changing environment (Peter and Swilling 2014).

Sustainability is thus a balancing act which requires an organization to simultaneously achieve market sustainability, which is the ability to maintain financial success over time, environmental sustainability, which is the ability to maintain compatibility between an organization's behavior and its natural environment, and social sustainability – which is the ability to maintain good relations with the widest possible cross section of stakeholders and support broader societal outcomes based on prevailing values and norms (Cohen 2011). Being embedded in economic, social, political, cultural, and biophysical systems that interact with each other requires that social actors pay attention to sustainability challenges, such as globalization, overextraction of resources, overproduction, overconsumption, overpopulation, and stressed ecosystems; and to related potential negative outcomes – such as climate change, pollution, biodiversity loss, human rights abuses, poverty and inequality, illiteracy, disease, war, and crime – that arise with complex relationships and with the decisions and actions of multiple organizational decision-makers across both time and space. Sustainability theory and practice must seek to focus significant attention on both natural and socioeconomic environments, ideally integrating, describing, and predicting their systemic existence and value; and prescribing both scientific and practical approaches which support the survival of both human and non-human systems without compromising the values of human connectivity, community cohesiveness and inclusiveness, individual freedom, equity, prudence, personal safety, stable employment and income, and continuous learning. Sustainability is the recognition that organizations and communities are not isolated entities but are part of a complex

network of interdependent, mutually-reinforcing and reciprocal relationships with other organizations, communities and the natural environment that affect socio-economic and socio-ecological outcomes along qualitative and quantitative dimensions now and in the future (Elkington 1997; Robinson 2004; Cohen 2011; Bowen 2013).

## Crisis and Crisis Management

The contemporary world is beset with many types of crises which often intersect with either social, economic, or environmental sustainability and which have the potential to threaten the long-term survival of organizations, communities, and even entire societies. The types of crises, their scale and scope, their frequency, and their potential impact are all increasing given greater technological dependence, economic interdependence, and demands on limited natural resources from a growing global population in need of food, water, energy, shelter, and transportation. The contemporary world can therefore be described as crisis prone and crisis laden, and this gives the impression that crises are omnipresent and proliferating, with an increasing number of segments of society facing damaging disruptions, upheavals, and restructuring.

There is no single and universally accepted definition of crisis but a widely accepted definition is offered by Coombs (2014, p. 3) who defines a crisis as "an unpredictable event that threatens important expectancies of stakeholders and can seriously impair the organization's performance and generate negative outcomes"; and crisis management as a structured "set of factors designed to combat crisis and to lessen the actual damage inflicted." Lockwood (2005, p. 2) similarly defines crisis management as "an organization's pre-established activities and guidelines for preparing and responding to significant catastrophic events or incidents in a safe and effective manner." The modern word crisis comes from the Greek word *Krisis*, which means a moment in need of a decision, and represents historical turning points where human choice could make a fundamental difference to the future. Crisis also has a meaning in medicine where it denotes the turning point of a disease, but one where external intervention and restructuring is required to avoid or reverse permanent damage. Crises are events that threaten the survival of the system but one from which the regenerative or recuperative functions of the system are insufficient or unable to pull it out of a crisis. A crisis therefore can be characterized as a disruptive event, where stakeholders have a heightened expectancy that must be carefully managed, which requires decision-making carried out with a sense of urgency, which has potentially large impacts to the organization as well as spillover effects to the wider society, and which requires restructuring to the system if it is to recover or emerge more resilient and more sustainable.

All crises have the potential to disrupt the operations of an organization and damage its reputation (Coombs 2006, 2014). With proper planning, precrisis training and rehearsals, and crisis management, most organizations can function normally during a crisis without disruptions to existing operations (Mitroff et al. 1987). In the absence of proper proactive measures, the long-term sustainability of the organization is jeopardized by distractions – from negative media attention and investigations by regulators – as well as from damage to the organization's reputation when stakeholders come to question the ethics and competence of organizational management. The management of expectations is essential to successful crisis management and recovery (Coombs 2006, 2014). Crisis can benefit an organization by providing the impetus or options for improving the organization's sustainability capacity, by identifying weaknesses that management has overlooked or ignored, and by forcing change in policies, procedures, and organizational culture. Thus while all crises present a challenge to organizations, they can present either opportunities or threats or both. An organization has a number of options for response to a crisis which can be pursued separately or in combination: accommodation, which involves incorporating unchanged the challenge into an organization's operations; adaptation, which

involves incorporating some variation of the challenge into an organization's operations; rejection, which involves maintaining the status quo; and redemption, which involves public acts of contrition by the organization for improper conduct leading to the crisis, or for mishandling the crisis response, but where the actions must demonstrate an actual rather than a symbolic commitment to correcting behavior (Coombs 1998, 2006, 2014). Accommodation and adaptation usually occur when the crisis can benefit the organization in some way and change is viable, while rejection risks an escalation of the crisis.

Like many human activities or issues, crises can be broken down into stages or phases which are a relatively identifiable, intelligible, and coherent sequence of events and reactions in a process of change or development. Fink's Crisis Life Cycle includes four stages: prodromal stage, where risk signals are often given off and the potential for crisis can emerge; acute stage, where a triggering event occurs and results in damage to an organization; chronic stage, where the organization suffers the lingering effects of a crisis and attempts to resume normal operations; and resolution stage, where the crisis is no longer of concern to stakeholders but where organizations with a focus on sustainability seek to learn from their experiences (Fink 1986). There is no set proportion of time for each of Fink's stages: each stage could last years or all four stages could run their course in a very brief period of time; however, all four stages must occur, although the acute stage is typically the shortest in duration and most intense and the chronic the longest in duration. The goal of any sustainable organization is to reach the resolution stage as quickly as possible, for organizations bogged down in the acute and chronic stages may find the burden of the crisis so overwhelming that they never reach the resolution stage.

Mitroff's Five Stages of Crisis Management include proactive and reactive stages which are: signal detection, where the environment is scanned for signals of potential or impending crisis so that timely and appropriate action can be taken; prevention/preparedness, where organizations undertake systematic planning, develop scenarios, and run simulations to test the quality of plans and the skills and competences of employees; containment, where the intensity and extent of the impact of a crisis is minimized; recovery, where the organization seeks to facilitate the speedy resumption of normal business operations; and learning, where the organization reflects on and examines the lessons from their own crisis experiences, as well as those from other organizations (Pearson and Mitroff 1993). While some contest the existence of "early warning signals," some research suggests that the majority of crises were "smoldering" or "creeping" crises that went undetected; and a minority of crises were "sudden onset" that would quickly and unexpectedly appear. Robust measures for prevention and preparedness cannot prevent all crises, but the chances of organizational survival will be increased and the degree of disruption minimized. If recognized and resolved early enough, prodromal events may never evolve into either triggering events or full-blown crises. During a crisis care has to be taken to ensure the accurate and timely flow of information so robust communication procedures and a clear communication strategy need to be in place (Coombs 2014). Good communication is key to protecting reputations. Learning is often the most overlooked phase as some organizations fear "opening old wounds" while others assign blame; however, this period is critical to sustainability as it facilitates the informed restructuring that is so necessary for sustainability. Organizations that put effort and resources into the proactive phases of signal detection, prevention, and preparedness are more likely to gain the reputation of being crisis prepared, while organizations that focus on containment and recovery are more likely to be crisis prone and tend to be less sustainable.

## Sustainability and Crisis Management: Drivers

An increasing number of organizations and communities are seeking to improve their capacity to deal with both crisis and sustainability. The drivers for this trend include a combination of

heightened media scrutiny, leading to increased public awareness, and strengthened government regulation regarding governance regimes for risk, driven by changing public attitudes in the wake of a constant stream of crises (Mitroff et al. 1987; Pearson and Mitroff 1993; Shrivastava 1993; Coombs 2014). Examples of recent crises that have had a long-term negative effect on several organizations, communities, and even nations include the Bhopal disaster at the Union Carbide chemical plant in India in 1984, the Space Shuttle Challenger explosion in 1986, the droughts of the US Midwest in 1987–1988, the Exxon Valdez oil spill off Alaska in 1989, the South-Asian tsunami in 2004, Hurricane Katrina which devastated New Orleans in 2005, and the BP-operated Deepwater Horizon oil spill in the Gulf of Mexico in 2010. Examples of organizations affected by crises which did not survive include Pan American Airlines in 1991, Enron in 2001, and WorldCom in 2002. Examples of organizations and communities that have faced crises and demonstrated resilience and sustainability include the tampering of Tylenol products in 1982, the turnaround of Apple Computers between 1997 and 2000, and the recovery of New York after the 9/11 terrorist attacks. Public responses to improve governance and risk management, and thus crisis management and sustainability, include the Sarbanes-Oxley Act of 2002, while private, voluntary initiatives include standards such as ISO 26000 for social responsibility and ISO 22301 for business continuity.

## Sustainability and Crisis Management: Joint Approaches

Organizations increasingly address crisis and sustainability issues in six ways:

1. First, by improving governance and organizational practices through risk management, environmental, and health programs, by adopting cleaner and leaner technologies, by carrying out preventative maintenance, by improving the safety and quality of products and processes, by redesigning products and packaging, by reducing polluting emissions, and by managing waste disposal (Mitroff 1994; Lehtonen 2004; Coombs 2010).
2. Second, by shifting organizational cultures from reactive responses to crisis issues to proactive approaches where crisis and sustainability management became an integral part of strategic management (Mitroff et al. 1987; Taneja et al. 2010). These cultures support the building of a sustained internal organizational capacity to deal with crises, with external expertise being called upon to address specific crisis-related tasks.
3. Third, by changing focus from a procedural orientation – which involves establishing emergency management procedures, crisis contingency plans, occupational health and safety procedures, and environmental audits – to broader crisis management skills where plans are continually tested and adjusted through drills and practice (Fink 1986; Mitroff et al. 1987; Pearson and Mitroff 1993). The presence of formal policies and procedures for crisis management is a necessary but not sufficient condition for organizations to be able to cope in actual crises.
4. Fourth, by changing from a public relations damage control orientation to a more proactive, comprehensive and substantive systems approach to crisis management (Coombs 2006, 2014). This shift is driven by good leadership and communication, which not only protects the image and reputation of the organization but also attends to the psychological and emotional needs of stakeholders.
5. Fifth, by recognizing that crises and sustainability are invariably implicated in complex power relations which are both internal and external to the organization (Shrivastava 1993; Robinson 2004; Cohen 2011). The nature and meaning of crisis and sustainability are contested and like any concept with a subjective component will be continuously subjected to the forces of politicization. Preparing the organization to avoid or weather crises and become sustainable often requires restructuring these power relationships, which will likely cause a reorientation of the existing

distribution of benefits and burdens, and gives rise to resistance to change that must be overcome.

6. Sixth, by recognizing the importance of far-sighted and ethical leadership which not only ensure that the plans, resources, and expertise is in place but which models the professional behaviors and communication styles necessary to succeed in a complex multi-stakeholder environment (Taneja et al. 2010).

## Sustainability and Crisis Management: Goals and Objectives

The goals and objectives of crisis management and sustainability are remarkably complimentary: with crisis management organizations and communities seek to avoid, minimize, or mitigate unfortunate events or capitalize on opportunities; with sustainability organizations and communities seek to ensure that social, economic, and environmental systems are stable, available, and replenishable in a way that supports the current organization while still being made available to the next generation of users (Shrivastava 1993; Lehtonen 2004; Crandall and Mensah 2008; Coombs 2010). Crisis management often focuses on one significant even at a time which poses an imminent threat to the survival of an organization or community; while sustainability tends to focus on macro level and systemic issues which connect economic growth to a wider range of concerns in the organization's environment that can include entire systems of firms, governments, and countries that must work together. One positive aspect that both sustainability and crisis management share is the promotion of learning and change at the organizational level, and history tends to suggest that much positive change occurs as a result of a crisis which overcomes organizational inertia and the power of vested interests. Crisis management is an important element of sustainability, and vice versa, and both should be incorporated into an organizations strategic plans because crises can restrict sustainability in the long term, and the maintenance and growth of organizations and communities can place demands and burdens on systems that can result in crises.

## Conclusion

At some point in its life, every organization or community will face a crisis or enter a phase where its ability to sustain itself is thrown into doubt. In the contemporary world, human-induced crises have reached the point where they could rival natural disasters in scale, scope, and impact, and even the human dimension of natural disasters is largely a result of human action or inaction, such as the choice of where to establish a community, the type of building codes for protection against hurricanes or earthquakes, or the decision when and where to evacuate in the lead-up to an event. Organizations and communities contribute to their level of crisis and also to their level of sustainability, and there is growing evidence that successful organizations – defined as those that consistently achieve their goals and objectives in the long-term – have an effective organizational design and robust institutions for both crisis management and sustainability. Crisis seems to be an inherent and ubiquitous feature of contemporary society and, together with the need for promoting sustainability, could be considered a normal part of modern life. Organizations imbued with a culture that embraces both crisis management and sustainability tend to be characterized by solidarity and cooperation among stakeholders, an improved alignment between the internal and external environments, a willingness to experiment and innovate, a receptivity to change and adaptation, and a belief that the organization serves some greater social purpose beyond the narrow pursuit of financial gain at all costs. Given the framework presented, an understanding of crises within the context of sustainability seems both plausible and necessary.

| Sustainability | It refers to balancing acts or conditions that show the ability constantly. |
| Governance | It means the political structures, systems, rules, and traditions that determine how decisions are made and how a government shares power and exercises authority and responsibility. |

S

## Introduction

United Nations (UN) member states agreed to adopt inclusive and transformative development approach that was decided through 17 Sustainable Development Goals (SDGs) in 2015. This flagship initiative was a major paradigm shift of the agreed countries to reaffirm international commitments to sustainable development. However, there have been agreements on sustainable development among the states at the United Nations (UN) platform, but still much differences of opinion with respect to the strategy and responsibilities about the process of implementation of SDGs (Scoones 2016). The process of governance and sustainability of development are highly contested issues in the contemporary social science research. It is stressed that sound political process and effective institutions require committed political leadership, clear direction, and appropriate strategic influence and the very fact that none of this will happen without a robust governance structure. However, there are growing debates and discussion with respect to the appropriate modes of governance for promoting sustainable development (SD). It is worth to mention that there is neither agreement on ways to meaningfully understand mode of governance that is required for SD. Despite the disagreements, there are approaches of the discourse "from government to governance" and "onward to adaptive governance" that adequately depict the paradigm shift and the complexity of governance structure (Lange et al. 2013). The aim of this entry is to critically examine the issues and concerns inherent in the mode of governance structure for the achievement of sustainability in development process.

## A Brief Outline of Sustainability

The concept of sustainability has been first invented in the case of sustainable forest management in Europe in the early eighteenth century; however the first ever nexus between sustainability and development was found in the late 1980s, when the Brundtland Commission operationalized the concept as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (Scoones 2016; Hens et al. 2006). This definition shows responsibilities that concerned agencies must deal with; for instance, the first complexity relates to the importance of three important values at the same time, such as ecological, social, and economic values. It is also highlighted that human behavior and nature of public policy influences each of these three important values. Second challenges and complexities are identified about how to function in a multi-actor policy setting, because resources (e.g., money, information and knowledge sharing, support services) are required for successful policy implementation (Hens et al. 2006). However, some of these actors must represent the government because of the nature of public administration into the public policy processes. Apart from that, the involvement of other stakeholders must be from private spheres, such as the market and civil society (Hens et al. 2006). These actors, apart from the government, are crucial and influential in the policy cycle which tends to emphasize the dependency of the government; hence governments need to consult with private actors and involve them in policy formulation and its implementation and evaluation.

## Political Processes (Politics) and Sustainability

Both the term governance and politics are very important for understanding, analyzing, and shaping transformations toward sustainability. The first underlying reason is that governance has effects on the state efforts to transform toward sustainability; secondly, any transformations toward sustainability are deeply and unavoidably related with political dimension, which needs to be recognized as such (Patterson et al. 2017). However, despite the growing importance of the role of political process in governance in recent years, further explorative and empirical literature of understanding and analyzing the nexus

between governance and politics about transformations are not developed (Patterson et al. 2017).

Watts and Peluso (2013) highlights for a proper understanding of societal change that requires examining three kinds of regimes in order to understand political dynamics. The first kind of it is called regimes of truth, meaning who understands what and in which directions; however, for the first time, Foucault introduced the regime of truth through which he defined and analyzed knowledge and power. Such regimes of truth may evolve through scientific application, calculative devices, and practices, for instance, climate models explored by the environmental scientists that may provide scientific explanation, and its justification for actions is what needs to be done for future generations. On the other hand, Foucault defined the regimes of knowledge as the tools of governmentality, which is termed as the "conduct of conduct" that define the justified knowledge for sustainable transformations in society (Scoones 2016). Furthermore, regimes of truth are related with the notion that Watts and Peluso relate to regimes of rule, meaning who controls what and which forms of governance are used in this regard (2013).

It is observed that regimes of rule were often survived by some factors, such as strong core public sector institutions and its system, and exerting effective planning and control of the economy (Scoones 2016). Scott (1998) highlighted the concept as "Seeing like a state" (Scott 1998) that provided the basis for the efforts of the government to maintain order, control, and exercise authority over local communities by means of coercive measures. However, confronting with such power from private spheres is not easy; this is possible through popular support or greater public involvement and citizen's participation as what Gramsci calls as "wars of position" that comes from private spheres which is outside the current regime that seek to gain influence in the policy processes, and political transformations are defined in terms of the political struggles between states and citizens (Tilly and Tarrow 2006).

However, the power and influence of the states are now declining due to the adoption of liberalization policy and the incapacity of the state in itself. This condition has been termed as a "post-political" polity (Wilson and Swyngedouw 2015), which is largely dominated by non-state actors, such as civil society and large corporations. On the other hand, in fragile and conflict-affected high-risk areas across the globe, states have, in general, become fragmented in terms of limited political and administrative authority within their national territory. This happened due to roles of other actors from private spheres, such as private corporate groups, local powerful elites, militia outfit and rebel groups, drug cartels, or organized terrorist or insurgent groups which may put pressure, dominate, and have control in the designated territory (Ballve 2012). Finally, political transformations need to be related with respect to regimes of accumulation, and its regulation, which is regarded as the classical issue of political economy (who gets what and how resources are distributed) (Scoones 2016). In the logic of a capitalist economy, interests are reinvested to facilitate capital accumulation, which is highly influenced by the ideas of profitable capital accumulation, be it by the state or non-state groups (Hall 2012). It is also important to highlight Karl Marx's view of "primitive accumulation," by which he argued about the capital accumulation process which typically emerges as a social relation of power and exploitation based on the argument that laborers are forced to work for capitalists who are the control of means of production (Hall 2012).

## Institutional Structures (Polity) and Sustainability

In order to facilitate sustainability, it is highlighted to undertake changes in the institutional structures that successfully govern or act with purpose. There are two underlying logics or rationalities for changes in institutional structures in order to facilitate sustainability; firstly, sustainability needs to change the structure of institution from separating to integrating, and secondly adoption of cooperative rationality in institutions, which is away from exclusively

focusing on individual rationality (Vatn 2009). The institutional changes from individual to cooperative rationality are highlighted due to the complexities that human being is now facing at the globalized world. Institutional changes are justified on the basis of the relationship between fulfillment of human motivation and structure of the institutions (Vatn 2009). However, there are wide varieties of literature on political institutions on how to shape sustainability, for instance, positive political theory explains about sustainability and connects the concept mainly with respect to environmental governance (Dumas and Urpelainen 2014). On the other hand, political economists, generally, are not concerned with sustainability, rather they emphasize on economic growth or the provision of public goods (Dumas and Urpelainen 2014).

There are many debates and discussion about the institutional basis of sustainability. From a wide variety of literature, it is explored how institutions promote or hamper the achievement of sustainability. In case of international institutions, it is stressed how absence of appropriate institutional framework at the international level hampers to achieve adequate cooperation, thus the non-successful implementation of legally binding instruments (Dumas and Urpelainen 2014). At the national level, most literature emphasizes the positive role of decentralized nature of institutions in order to enhance sustainability. However, institutional sustainability has become a great challenge in most countries located at the south. It is worth to mention that powerful institutional structure may foster sustainable development and good governance principles. The contemporary governance literature also explores the role of policy-related networks and association, effective leadership, mutual trust, and organizational structure, highlighting adaptive management and social learning (Dumas and Urpelainen 2014).

## Attributes of Adaptive Institutions

Ecologists highlight the challenges of managing ecological balance; therefore they have developed the concept of "adaptive management" (Dovers n.d.) as experiments, along with strong monitoring mechanisms, flow of information, and providing continuous feedback to increase policy learning, thus improving plan of action in the policy process. Hence, it is emphasized to introduce the "adaptive" model of institutional framework and policy processes which act with purpose (Dovers n.d.). However, there is some logic or rationality by highlighting some attributes of an "adaptive institution" that tackle problems and support sustainability in development. Over the decades, there have been some sets of attributes that are contributed by institutional theory, the nature of uncertainties and complexities of sustainability, and learning experience from environmental management (Dovers n.d.) that are discussed as below:

*Persistence and longevity.* These attributes highlight the importance of sufficient time to learn and develop policy and management measures, and these measures need to be supported by regulatory framework, avoiding the so-called efforts of the government as "policy initiative."

*Purposive approach.* There is a need for accepted and purposive principles that strengthen policy. For instance, ESD is the statement of principles for the sustainable management of forests that was adopted by more than 178 countries, depicting the international commitment held in Brazil at the 1992 United Nations Conference on Environment and Development (UNCED).

*Information and knowledge sharing.* There is a need for scientific application and wider experiment of traditional and community knowledge, showing the relationship and interaction between environment and human, thus supporting the effectiveness of policy and management actions.

*Participation of multi-stakeholder.* It is highlighted the importance for the continuous involvement of relevant stakeholders and the concerned/affected communities in the policy cycle. This participation and involvement (PI) must be clear and transparent in terms of the responsibilities multi-stakeholders undertake over time.

*Experimental study.* This attribute is quite important for adaptive institutions, as applying policy learning and improving plan of action is emphasized. This highlights the positive role of organization about policy learning, and its effective management, and clear mandates for research and comparative analysis and use of innovative approaches.

*Coordinated and coordinating.* This helps organizations to be well-connected, structurally and functionally, to other parts of the organizational settings.

*Sufficient resources.* It needs financial resources, skilled human resources, and administrative capacity.

It is worth to mention that combining all of these attributes in one institutional arrangement is not an easy task; furthermore, all of these are always not necessary every time. Despite this fact, the above attributes of institutional arrangements perform well against social uncertainties and complexities, and this may create a basis for analyzing the current institutional arrangements whether it may support or hamper the achievement of sustainability in development.

## Conclusion and Summary for Governing Sustainable Development

In conclusion, the strategies for achieving sustainable development must be related to a form of governance, supported by a nonhierarchical nature which might be termed as "partnership," where both the public and private actors actively engage in the policy formulation and its implementation and evaluation (Hens et al. 2006); however, this form of nonhierarchical nature of governance contradicts the traditional model of hierarchical nature of governance. Under the traditional form of governance, the decision-making power was highly centralized, which was exclusively vested in one or a group of policy-makers at the center. Apart from the classical types of governance, two forms of governance are found, for instance, "multi-level" forms of governance which highlights the various tiers of government, such as local, regional, national, or supranational, and, on the other hand, "multi-actor" forms of governance, which reflects the participation of both public and private actors (Hens et al. 2006). It is important to note that in both cases "multi-sector" governance is necessary to facilitate sustainability in development, for instance, integrating environmental aspects in non-environmental policy settings and practices for greater use of sustainability objectives (Hens et al. 2006).

# Sustainability as Organizational Strategy

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida, Pensacola, FL, USA

## Synonyms

Accountability; Administration; Ethics; Integrity; Leadership; Management; Organizations; Resilience; Strategy; Sustainability

## Definition

Sustainability as organizational strategy is applied in both the public and private sector organizations as a set of concrete efforts to reduce the negative impacts on the environment and the society as a whole from the operational activities in service provision and product creation.

## Introduction

Sustainability is defined through the set of active and efficient actions undertaken by organizations to positively impact societal issues, foster economic development and growth, reduce adverse environmental consequences, and improve overall governance, including accountability and transparency of operations. Over the past two decades, sustainability planning became an integral part of organizational strategies and strategic planning efforts. In private sector, sustainability is often utilized to supplement the strategic plan under the guise of corporate social responsibility or corporate responsibility. Cities and counties employ sustainability as an enabling and a multifaceted approach to the betterment of communities and improvement of operational efficiency. One of the overall goals is to provide for more accountability and transparency of service delivery.

In principle, organizations are engaged in sustainability with multiple benefits to the society as a whole, encapsulated through their ability to reduce adverse impacts from their operation on the environment and the society as a whole. Through active decision making and practical applications of sustainability, and developing succinct measures and objectives, organizational leadership designs an operational paradigm for the organization, while strengthening the core resiliency and adaptability to societal and environmental threats and opportunities. Fiscal constraints and the impact of a global economy on local governance and the ability to deliver outcomes are significant disruptions. Local governments engaged in sustainability can adapt, transform, and accept discontinuities as they continue to provide services without interruptions. In a crisis, sustainability-related efforts become an opportunity and a tool for local governments as then they need to change their priorities, reporting, measuring, and outcomes of the budget process.

## The New Normal: Strategic Management and Sustainability Planning

As the societal pressure shift, organizations use sustainability in pursuit of long-term strategic goals and an attempt to reduce the adverse environmental impacts from activities related to service delivery or production. While the strains differ from one sector to another, the external and internal pressures are exemplified through

the struggles that local governments face. For example, Martin et al. (2012) and Ammons et al. (2012) discussed the new normal for local governments and observed pressures pulling resources in multiple directions. This shifting of priorities and challenges facing organizations is consistent with the processes presented in sustainability planning. Ideally, organizations will use both strategic and sustainability plans or a sustainability plan with strategic management steps in the process.

Strategic management is a never-ending process, combining strategic planning and leadership with other management processes. As noted in Alibašić (2017), sustainability planning is "a set of effective and efficient actions taken by an organization, through good governance, to ensure the economic stability, growth, and financial success, with the most positive societal outcome and the least negative environmental impact" (p. 37). As such, in sustainability planning, organizations must take into consideration all four pillars of sustainability and integrate them effectively into their long-term goals and objectives. Leadership is critical to sustainability planning and implementation, as noted by Strand's (2014) review of corporate efforts to implement sustainability and the role that staff dedicated to sustainability play in the implementation of sustainability programs and opportunities.

In response to rapid changes occurring in the surrounding environment, an organizational leadership uses strategic management and sustainability planning. Koteen (1997) saw the strategic management as nonstatic, dynamic approach to addressing external and internal obstacles and for embracing opportunities. Strategic management is thus observed as a changing, progressive, and driving force applying to every level of organizational governance. Moreover, the strategic planning provides a methodology for organizations to address challenges and obstacles, and to plan for varying circumstances. Finally, Switzer (2008) offered the following definition of strategic thinking, as one involving "emerging trends, identifying whether or not they represent opportunities or threats to the organization, and developing an organizational response to take advantage of the potential opportunity or mitigate the threat" (p. 32).

Similar to sustainability planning, strategic management requires an overview of where the organizations are currently in their governance, their structural deficiencies, system approach to operations, and desired short-term and long-term outcomes. Concurrent to their sustainability planning, organizations may be deploying strategic planning following specific steps in the process as they seek to achieve certain goals and objectives. Answering particular strategic questions will conclusively lead to a change and step ahead in targeted efforts to meet mission, vision goals, and strategies. While historical crises, such as financial recessions, resource shortages, are cyclical in nature, new challenges and opportunities in modern era, including but not limited to changing trends in transportation modes, communication methods including the rise of social media, artificial intelligence, cybersecurity to name a few present nascent organizations with far more significant risk and challenges than in the past. Strategic management initiatives serve as guidance for administrators to navigate end-goals and predefined objectives.

## Sustainability Planning

Sustainability planning became a panacea for many organizations, seeking the long-term planning from an environmental, social, economic, and governance perspective, in a systematic and purposefully defined, interconnected realm of issues and responsibilities. As a relatively new concept, sustainability planning and strategic sustainability, there is a direct correlation between the strategic management practices. The difference is the sustainability planning and the focus Triple Bottom Line (TBL) or the expanded pillars of sustainability, the Quadruple Bottom Line. Similar to strategic management, sustainability planning processes are replicated from one sector to another. Sustainability planning may be defined as a set of initiatives, in a relatively designated space and time, which provides for long terms vision, planning, and implementation using a set of interconnected areas of concerns for the organizations, including but not limited to governance, economic growth and development, social impacts, and environmental concerns (Alibašić 2017).

Sustainability planning in local governments relates to the fact that organizations are interested not only in the issues of economic, social, and environmental significance but also are involved in the best and most efficient governance of the agency (Alibašić 2017). Furthermore, Alibašić (2017) posited and defined the Quadruple Bottom Line (QBL) "as the organizational capacity to embed and incorporate a set of definitive policies and programs to address economic, social, environmental, and governance aspects of sustainability, whereas governance, is defined through fiscal responsibility and resilience, community engagement for efficient service delivery, transparency, and accountability" (p. 41). Slavin (2011) posited the governance to be one of the critical elements of sustainable cities that include the design and management of operation with the lowest possible carbon footprint.

Sustainability planning design in local governments, including social, environmental, and ecological balance in mind, may be applied to any public service or private sector organizations. Moreover, Coyle (2011) highlighted the relevance of a low-carbon built environment in a resilient and sustainable community and the essential role organizations play in meeting the custodian role of resources. Elements of organizations using sustainability planning include a compact and bounded development pattern, a supporting system, including economic, energy, water, natural environment, transportation, and robust waste system. Such systems are not resource-dependent and are renewable resource-based, flexible, efficient, resistant, and durable. The primary focus of organizations with sustainability planning in place is the improved conservation and efficiency measures. The imperative of nascent organizations is seeking a balance between natural resources consumed and regenerated and potentially reused and repurposed (Fogel 2016).

## The Learning Organizations and Sustainability Planning

A learning organization, sustainability, and the priorities of a strategic manager are intertwined conceptually. Garvin (1993) proposed that organizational leadership must be committed to experimenting, transforming, learning, and solving problems systematically rather than implementing programs and policies alone (Garvin 1993). Ismail et al. (2014) furthered the notion of learning organizations suggesting that especially prominent organizations must use experimentation in their operations. Creating a learning and sustainable organization is an imperative the strategic manager. An essential element of good governance is the organization accountability towards stakeholders, accessibility, transparency, and ultimately the ability to transform (Alibašić 2017). The concepts of transformation, learning, and adaptability can be found in the learning; transformative organizations focused on sustainability. Garvin's (1993) view on systemic approach to problem-solving, including experimentation, is in line with Ismail et al. (2014) view of exponential organizations and the necessary for experimentation toward transformation. The emphasis placed on learning and flexibility is imperative to the longevity of the organizations. Furthermore, the learning organizations are concerned in promoting accountability in operations and ethical service delivery and production.

## Measuring Sustainability Efforts

The concept of sustainability-related measurements is often emphasized through the use of Triple Bottom Line (TBL) and the corresponding indicators in the environmental, social, and economic platforms. The nature of indicators is to provide a snapshot of measure over a period with the benchmark data to track the end goals for comparison purposes. While Bell and Morse (2008) explained the sustainability indicators and indices, Ramos and Caeiro (2009) evaluated the performance of sustainability indicators. Alibašić (2017) challenged the existing approach to sustainability measurements, the static nature of the Triple Bottom Line, and the use of indicators in sustainability reports.

In addition to economic, social, and environmental implications, the Quadruple Bottom Line

adds dimension to sustainability by focusing on governance. While most organizations use sustainability indicators in their reporting and have a separate sustainability plan from a strategic plan, there are examples of organizations using targets in sustainability plans and reporting and using sustainability plans as strategic plans. The performance monitoring, feedback, reporting, and reassessment or revision in strategic and sustainability planning are utilized in sustainable organizations for constant input for robust. Strategic and sustainability planning go beyond finding a solution to a problem and lead to the development of new ideas to confront an organizational threat, weakness, and challenges.

## Conclusion

Sustainability planning is the ability of organizations to create a state of an efficient and flexible system where all factors of its functions and operations can be sustained. A sustainable organization is designed to be resilient economically, environmentally, socially, remaining viable through time and the variations in governing structure ensuring accountability, transparency, and organizational integrity. While sustainability planning differs from strategic planning insomuch as the emphasis of sustainability planning is expanded beyond the financial and economic bottom line, the two are interconnected and interdependent.

# Sustainability of NGO Project Benefits in Uganda

Pius Gumisiriza
School of Public Policy and Governance, Uganda Management Institute, Kampala, Uganda

S

## Synonyms

Communities; Nongovernmental organizations; Participation; Project benefits; Sustainability; Uganda

## Definitions

In this entry, the term sustainability is used to refer to people or communities' ability to build upon

benefits obtained from nongovernmental organizations after the latter's exit from those communities (Oxfam 1995). NGOs are defined in this entry as institutions that work to improve conditions of people with a nonprofit orientation, are formalized, and are not government owned (Anheier et al. 2007).

## Introduction

This entry discusses the challenges and the mechanism employed by communities to try and sustain project benefits in Uganda. Nongovernmental organizations (NGOs) both local and international such as World Vision, Save the Children, ActionAid, and Action Against Hunger Africa, among very many others, have made an enormous contribution toward well-being improvement through providing humanitarian, relief, and development needs of poor and vulnerable people in Uganda over the years. Most of these NGOs started to carry out relief and development work operations in Uganda after 1986 at the time when the country was recovering from repeated political conflicts and socioeconomic upheavals mainly to support education of orphans and rebuild social infrastructure (schools, health centers, water sources, and homesteads for people in Luwero Triangle). Since then, NGOs such as World Vision have worked with rural poor communities most especially the war-affected in the Northern region and areas where HIV and AIDS eroded livelihoods to build the capacities of families to move toward self-reliance on food security, peace building, and advocacy through an integrated, holistic, and transformational development approach that is community based and sustainable. The rise of international NGOs as the preferred channel for poverty reduction and service provision in poor countries was neither an accident nor a response to local initiatives or voluntary action. It was due to a development thinking organized around neoliberal principles and the argument that NGOs are cost-effective in reaching the poorest and better provide welfare services to those who cannot be reached through markets. It still has been documented by several organizations and academic studies around the world that a significant number of rural communities fail to maintain or improve upon the benefits achieved from NGOs after the latter's exit from their places. This in many cases has led most donors to demand NGOs to put a lot of emphasis on sustainability of their projects (see Edwards and Hulme 1997; Cannon 2002; Lockwood et al. 2003). Many NGOs, development practitioners, and scholars have advanced factors that may constrain or enhance sustainability of NGO project benefits in poor rural communities. This entry discusses how participation, empowering of local institutions, durability of project benefits, government support, partnership with private sector players, and addressing wider society development challenges such as poverty reduction and infrastructure development can help enhance sustainability of NGOs project benefits in Uganda with specific reference to World Vision Kakuuto Area Development Project in Kakuuto district.

## Participation

Participation has been emphasized by many scholars and development practitioners as one of the key factors that can first of all result into pro-poor projects and project benefits that can be easily sustained by the beneficiary stakeholders. The World Bank defined participation as a process through which all stakeholders influence and share control over development initiatives, decisions, and resources that affect their lives. However, participation like many other concepts within the field of development has become or been used as a catchword even by organizations that have little to do with people or participation itself and can be used to mean different things in different contexts. For example there is passive participation where people participate by being told what has been decided or already happened. There is participation by consultation where people participate by answering questions with no sharing in decision-making. Participation for material incentives where people participate in return for food, cash, or other material incentives and have no stake in prolonging benefits when incentives end and interactive

participation where all people with vested interests in the project are involved choosing, prioritizing their most pressing problem, planning projects, deciding location of project facilities, and encouraging them to provide contributions like labor, time, money, and materials toward construction of project structures arouse a sense of community ownership; reduce passiveness, resentment, conflict, and dependence; and enhance the desire and commitment of those people to sustain benefits after the NGO's exit (Khwaja 2006; Lockwood et al. 2003). Even in practice, many studies have indicated participatory approaches to development do not happen, and it has been argued that NGOs have never sustained faith in the ability of poor people to bring about their own transformation. As a result poor people are limited to relatively inconsequential areas of participation such as providing information, and in other cases participation is misconceived with or reduced to the use of community support for the implementation of preconceived, externally planned projects and priorities or to the inclusion of few stakeholders in decision-making (Burkey 1993). Other studies have described participation as induced, coerced, pseudo, or top-down form of forced labor where the poor were pressured into making far more substantial contribution than the rich, and this kind of participation leads to failure in sustaining project benefits. Even in projects with high levels of participation, outside agendas get expressed as local knowledge, and what is labeled as local knowledge is often a construct of the planning context that conceals the underlying politics of knowledge production and use. In many cases, participatory exercises are public and open-ended events where target groups create spaces to collude and manipulate projects to serve their own interest. Thus, what is reflected as local knowledge is strongly shaped by perceptions of what the project can deliver, local power relations, and the extent to which women are allowed to participate in project activities outside the home (Moser 1993). Because of all these factors, participation may not mean much toward sustainability unless questions of who participates (e.g., just an elite, women, men, leaders, governments representatives), what they participate in (e.g., initiating the project, implementation, decision-making, evaluation, or maintenance of resources), how they participate (e.g., as benefit recipients or as project designers), and for what reasons they participate (e.g., as a means toward other objectives or as an end in itself) are properly handled and understood (Brohman 1996). All these questions are very important, but in many instances they are not put under real consideration because NGOs put strong emphasis and value on donor accountability particularly because of the need to continue receiving funds or increase their flow (Edwards and Hulme 1997). In Uganda, World Vision has been hailed as one of the model NGOs whose projects involve stakeholders right from community problem assessment before project design and during the project design processes, implementation, monitoring, and evaluation stages. In every project that they implement, they establish project committees at village, parish, and subcounty levels and developed their competencies through training and equipping them with relevant skills to manage project facilities. These are planned during design and followed during implementation and maintained after WV departure from the community (Kakuuto 1990). Studies in other areas have also asserted that ideally, committee members should be accountable to the community, and this can be achieved through putting in place systems and procedures that ensure the community is fully informed of what the committees are doing and make them accountable. Committee members should be responsible for enforcing regular payments by community members, maintaining project facilities by addressing issues like vandalism and unauthorized utilization of facilities. Backing by the traditional leadership-power structure is also vital as these leaders can enforce regular payment and penalties for default more effectively, and their cooperation is essential in resolving conflicts and crises.

## Empowering Local Institutions

Many NGOs' project benefits have been known to fail because of lack of appropriate institutional support (see Harvey and Reed 2007). Empowering local institutions so that they can

take over management after the NGOs' exit is also an effective sustainability strategy. The process of empowering local institutions in poor communities goes beyond mere transfer of knowledge, technology, or skills and emphasizes aspects of capacity building that involves organizing, training, and orienting beneficiaries to assume responsibilities to run project facilities properly and autonomously (Robinson 2004). World Vision also identified, supported, and partnered with existing institutions and organizations such as faith-based organizations, community-based organizations, youth groups, women groups, and self-help groups and cultural institutions such as Buganda Kingdom and community care coalitions. These were enabled to undertake capacity building training courses in resource mobilization, community development, sanitation, hygiene, and disease prevention. World Vision endeavored to identify, partner, and collaborate with all available stakeholders already existing in the community and local government officials so as to ensure there was no conflict of interest (Kakuuto 1990). World Vision built physical structures such as boreholes and health center buildings with support and contribution from the community, equipped them, and handed them over to community management committees. The committees were supposed to oversee day-to-day maintenance of these structures and raise money in form of user fees and contribution from well-wishers to meet costs of doing repairs like painting, repairing floors, leaking in the roof, and other small damages. Local government would take responsibility for any other development, and the subcounty was entrusted to take responsibility for repairing major damages or renovations. In terms of the functionality of committees after World Vision's exit from Kakuuto, it has been found out that when World Vision left, the committees became dysfunctional because they had no basis for authority and were a duplication of what government has already put in place giving an example of World Vision village, parish, and subcounty health committees that were similar to voluntary counselling, testing and home packer distributors (for malaria treatment), technical planning, and parish development committees established by government.

## Durability of Provided Project Benefits

Sustainability of NGO project benefits may also be dependent on the quality and value of project facilities. If beneficiaries perceive that the project benefits are worth maintaining, they will put more efforts to maintain them. If the benefits are of less value, they are more likely to be irresponsible, resulting in failure and breakdown (Njonjo and Lane 2002). In Kakuuto district, World Vision worked hand in hand with the district health department to construct, equip, and standardize the existing health facilities as a way of accessing health services to the local people in accordance to the ministry guidelines. The project constructed 4 health unit buildings, 2 staff houses, 5 pit latrines, 1 maternity ward, drugs, and 5 water tanks, supported 11 health units with drugs and equipment, supported 7 health centers to conduct immunization, and provided antenatal and postnatal care to mothers. They trained 376 community health workers, 138 traditional birth attendants, and 150 malaria monitors. 3,950 treated mosquito nets were given out, and 35,360 vulnerable persons were supported to access medical treatment. However, World Vision evaluation reports indicated that save for the seven health centers constructed, the rest are not sustainable beyond their immediate beneficiaries. Even for the health center structures that were physically permanent structures, the physical assets' aspect of the sustainable livelihood framework cautions that if not properly planned, physical assets may not generate an improved flow of future services, and in this instance health center buildings constructed amidst people who cannot afford drugs represent a failed decision and unsustainable benefit. It has also been argued that improving health care does not necessarily mean providing health care itself because the health sector generally has little or no control over many of the most powerful influences on health, such as education, food supply, employment, transport, housing, and poverty (Braveman and Gruskin 2003). Project benefits such as mosquito nets are good for malaria prevention but cannot last beyond 1 year and cannot be extended to another beneficiary after that

time. Benefits like skills and expertise in traditional birth practices were sustainable at the individual level of trainees retaining skills. They decide utilizing their services at a cost to those that need them. In the circumstances this is tantamount to fact that the project was not sustainable beyond the individual level. The traditional birth attendants themselves are not supported by government, and thus many have given up the practice since they say it is of no benefit for them to work without payment, yet midwives in government health centers are paid and well facilitated.

## Addressing Broader Societal Problems

NGOs may be successful in implementing projects and leaving behind project benefits, but communities may fail to sustain them because of factors lying outside the project sector such as poverty, which calls for a paradigm shift from single sector service provision to an appreciation of the broader economic, social, and political realities. For instance, in Kakuuto district, like most Ugandan rural communities, over 80% of the population is engaged in substance agriculture and the remaining in petty nonagricultural activities such as brick laying, carpentry, brewing, fishing, and petty retail trade in various items like salt, food crops, household utensils, sugar, salt, and kerosene; absolute poverty remains acute affecting over 50% of the population. The place is poorly served with roads, and access to clean water, electricity, and hospitals is a big challenge. Thus, project activities such as giving mosquito nets to prevent malaria without addressing the cause of why people cannot afford to buy nets on their own leave them in a vulnerable position and make that benefit unsustainable. In such contexts, favorable government policies and support in strategic areas are needed to provide inputs and investment. The government of Uganda has in the last 10 years focused its energies on infrastructure development especially roads and electricity generation with the argument that these will facilitate easy movement of goods and reduce the cost of producing goods, create jobs, and facilitate industrialization, and in this way, both government and NGOs are reinforcing each other.

## Government Support

It has been noted that most democratically elected governments even authoritarian but poor governments do provide support to NGO projects at the start because they bring services to their people that the governments may be constrained to provide. However, it is also well known that most NGOs begin to conflict and have a tendency to compete rather than cooperate with local or national governments when they get established in the area, their projects remain largely isolated from government programs at field level, and communities supported by NGOs often pose challenges to local or national political interests as they get stronger. Other NGOs have been accused of working to promote social, economic, religious, and political interests of those funding them or their countries of origin. In recent years, such conflicts have escalated between some NGOs especially those involved in promoting human rights, advocacy, democracy, family planning, and the government of Uganda. President Museveni and his government have asserted that many NGOs are conduits for money and resources meant to undermine his government and Ugandan national interests. Because of this, a crackdown on NGO activities has been ongoing, and many such as ActionAid that advocates for good governance and human rights have had their offices and bank accounts closed. Recently an American NGO had promised to fund and implement a water project that aimed to provide 200 boreholes in Mityana district in central worth millions of dollars. The NGO had started implementing the project, and government was tipped off that actually part of the money was to finance political opposition activities and was subsequently cancelled. In other instances, where governments may not be conflicting with NGOs, other factors may limit their ability to sustain NGO project benefits. For instance, in Uganda, local governments depend on funds from the central government, which not only

come late most times but also are meager and in most case cannot run the district through the year. Therefore sustaining project benefits from big NGOs with a lot of funds is very difficult.

## Private Sector Players

Private sector players such as banks, telecommunication companies, education, and health providers, among others, have also been touted as a sector that can reinforce sustainability of NGO project benefits in communities because they deal directly with service provision and capital flow within an economy. It has been suggested that NGOs can create linkages with private sector players so that their services are efficient and essay to sustain once NGOs phase out projects. However, some scholars have argued that the key objectives of NGOs, which are mainly service provision, are antithetical with private sector objectives which are majorly profit making. Others have even argued that this suggestion is linked with the new policy agenda whose aim is to reduce the role of the state in the provision of services in developing countries while promoting the interest of private sector companies. In Uganda, the private sector is embryonic and is dominated by very petty business operators who are struggling to survive and cannot be relied upon to build on NGO benefits. In most places where NGOs operate, these small-scale private sector operators survive on the resources and opportunities provided by the NGOs. For the big players such as banks and telecommunications, there have been achievements and serious challenges. The much hyped private sector-led growth has been sluggish especially in the financial sector. When the government privatized the well-functioning Uganda Commercial Bank, the main argument was that it would bring down interest rates and better services to customers especially farmers. This has not happened, but instead there has been an increase in a number of private banks, all of which charge exorbitant interest rates (above 24% per year) and offer short-term loans that are not helpful to farmers. Without capital to improve their farms, most poor farmers cannot get an income to sustain most benefits gained from NGOs. One of the most recent and phenomenal innovations has been introduction of mobile money services to Ugandans by telecommunication companies Airtel and MTN. These have been able to connect most parts of the country and easing communication. Their mobile money services had also created a revolution in terms of how people can send and receive money for business purposes or from their loved ones. However, in the 2018/2019 budget, the government introduced several new taxes on mobile money operators and both people sending and receiving money. As a result, most low-income people in rural places cannot afford the increased taxes and costs associated with mobile money. There has been serious debate even in parliament and the general population that instead of taxing mobile money which was helping support people that even banks had failed to reach, government can raise money by reducing on its wasteful expending through a bloated parliament, cabinet, districts, and advisors and fighting grand corruption. By reducing those inefficiencies, government can better raise resources other than cripple its poor population.

## Conclusion

Sustainability of NGO project benefits is a very complex process influenced by many factors including those imbedded in how the project was designed and implemented in the first place, the stakeholders involved, government support, and empowering local institutions to also take the NGOs' exit. External factors outside the scope of most NGO projects such as road infrastructure, electricity, and Internet connectivity also influence greatly on whether communities may be able or not to sustain project benefits and should be worked upon by responsible stakeholders in the private sector and government. Most importantly, it is the beneficiaries themselves that hold the key on whether to build on the benefits of NGO projects or allow them go down the drain.

# Sustainability Report in Local Governments

Davide Giacomini[1], Mario Mazzoleni[2] and Roberto Negri[2]
[1]Department of Economics and Management, University of Brescia, Brescia, Italy
[2]University of Brescia, Brescia, Italy

## Synonyms

Accountability in local governments; Accounting for sustainable development; Social reports

## Definition

The external reporting, together with the implementation of performance measures, is one of the strong points of the reform processes that have touched the public sector over the past decades (Marcuccio and Steccolini 2009). On the other hand, the issue of sustainability has increasingly imposed at the international level and the local governments are considered among the first actors called to implement the sustainable development practices. It is not surprising, therefore, that the combination of the two above mentioned trends leads to the growth of the importance of the sustainability report as a tool to promote sustainability.

## Introduction

Generally private and public organizations publish their sustainability activities by SR mainly in

order to: (1) evaluate the current status of Organization progress towards sustainable development; and (2) make known to those concerned the efforts and progress made in the different dimensions in which sustainability can be declined (Dalal-Clayton and Bass 2002).

The role of local governments for promoting the agenda of sustainability accounting and accountability is often not sufficiently considered. In the world of public sector organizations, local governments are the closest institutions to their communities and thus have a particularly important role to play in the pursuit of sustainability goals (Ball 2002; Sciulli 2011). For this reason, further research is still needed to understand if and how LGOs are reporting their activities to promote sustainable development.

## The Paradigm of Sustainable Development

Nowadays the paradigm of sustainable development (SD) is considered as one of the key research and policy issues (Brandon and Lombardi 2011). Nevertheless for terms like "sustainable development" and "sustainability" there are no universally accepted definition. The most frequently quoted definition is from Our Common Future, also known as the Brundtland Report of the United Nations World Commission on Environment and Development (WCED 1987); sustainable development is defined as "*development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts*:

- *the concept of 'needs', in particular the essential needs of the world's poor, to which overriding priority should be given; and*
- *the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs*.

*2. Thus the goals of economic and social development must be defined in terms of sustainability in* all *countries – developed or developing, market-oriented or centrally planned. Interpretations will vary, but must share certain general features and must flow from a consensus on the basic concept of sustainable development and on a broad strategic framework for achieving it*."

Twenty-five years ago at the United Nations Conference on Environment and Development (UNCED) held in Rio de Janeiro in June 1992, about 170 governments agreed on a common commitment – defined Agenda 21 – including programs and aims in the field of social and environmental sustainability. Agenda 21 assigned a well-defined role to local governments because many of the issues addressed by Agenda 21 have their roots in activities at local level. More recently also the United Nations Conference on Sustainable Development (the so called Rio+20) emphasized the issues related with sustainability and the function of the PSOs (Public Sector Organization) in facing these challenges: "*Given the scale of the challenges, the international community will not make meaningful progress without much greater action by governments in the coming years and decades*" (Rio+ 2012, p. 23).

## Accounting and Accountability for Sustainability

While the private sector has devoted increasing attention to the issue of sustainability accounting, the public sector and not-for-profit sector only in recent years have increased the interest on the topic (Ball 2004; Dumay et al. 2010). In the private sector, sustainability reporting is often related to the pursuit of a "social license to operate," and sustainability reporting in the local governments and more generally in the public sector refers to legitimacy-seeking behaviors.

As previously mentioned, public sector organizations play a central role in delivering the sustainable *development* agenda (Ball 2002; Ball and Grubnic 2007; Larrinaga-Gonzalez and Bebbington 2001). The sustainability reporting could be provided to assist achieve these aims; it could be seen as a process that lead to different outcomes (in terms of organizational changes,

communication, and management) (Niemann and Hoppe 2017). According to Burritt and Schaltegger (2010), SR is a tool to help managers deal with sustainability decisions. However, there have been few researches on the link between sustainability reporting in Public Sector Organizations (PSOs) and Organizational Change Management for Sustainability (OCMS).

The last twenty years have seen an expanding attention to sustainability accounting. The adoption of sustainability reporting is not mandatory in many countries; nevertheless, several organizations produce such reports. The majority of researches in this field have centered their attention on the private sector (Guthrie and Abeysekera 2006; Parker 2005). Scarce attention has been dedicated at the reasons that drive PSOs do sustainability reporting (Burritt and Welch 1997; Guthrie et al. 2010). The literature on sustainability reporting is concentrated in particular on the results represented in report, but little research has focused on understanding the characteristics and reasons for the preparation in the context of public sector (Giacomini 2016). In this regard, Ball and Grubnic (2007) state that the economic dimension and the environmental impact and responsibilities would be expected to lead sustainability reporting in the PSOs. According to Gray (2006), institutions disclose their SD activities only if they are convinced that this increases the perceived value by the stakeholders.

Sustainability reporting tools can refer to different theoretical framework and reporting standards, among them the triple bottom line (TBL) reporting, where the three dimensions are social, economic, and environmental, or in other words people, planet, and profit. A good example of TBL's key strategic adoption is Raleigh's capital city of North Carolina. In fact, The City of Raleigh incorporated the triple bottom line in its 2030 Comprehensive Plan by including a commitment to sustainability: "*Raleigh's commitment to sustainability is a cornerstone of its vision for the future. That vision is broad and comprehensive and focuses on the interdependent relations of environmental stewardship, economic strength, and social integrity. These three elements define the vision and will serve to guide the choices and decisions that Raleigh will have to make as a 21st Century City of Innovation*."

At the same time, *global* organizations supporting sustainability reporting were founded. In this field, the most important is the Global Reporting Initiative (GRI), which has developed a voluntary sustainability reporting framework for private companies and also specific standard and guidelines for public sector organizations.

The adoption of the sustainability report is not simple for Local Governments. Often, the limited financial resources available and the lack of skills among *municipal* public servants lead to the result that the sustainability report is prepared only by bigger local governments. Even so, some local governments decide not to adopt real sustainability reports, but rather to use websites to publish some information about their strategy towards sustainability.

## Conclusions

More generally, the study of SR in LGOs can contribute to the *understanding* of the phenomenon of sustainable development, as municipalities are the institutions considered closest to the citizens. Despite the growing interest on sustainability reporting over the past decade, there are few empirical studies carried out in order to assess the degree of distribution among LGOs. This lack of sustainability research has to be filled to understand how public sector organizations should play a preeminent role in sustainability (Ball and Bebbington 2008).

The introduction of a compulsory sustainability report, as required for instance by the European directive 95/2014, may bring also small municipalities to *work* on the theme of sustainability thanks to the information inductance process started from the obligation of reporting. Information inductance is the process by which the behavior of an individual is influenced by the information that is required to disclose (Prakash and Rappaport 1977). Obviously the introduction of mandatory SR bring a concrete risk: as detected with the introduction of managerial accounting, a reform enforced by law tends to become a matter

of compliance rather than a mechanism for enabling change (Panozzo 2000).

# Sustainability Reporting at Universities

Sara Moggi and Bettina Campedelli
University of Verona, Verona, Italy

## Synonyms

Integrated reporting; Social accounting; Social reporting

## Definition

It is the process of disclosing the sustainable actions of a university including social, environmental, and economical measurements.

## Introduction

The increasing focus on sustainable development has driven the educational system to consider the main aspects of this issue that students could study throughout their education. Universities, as part of this pathway, have a pivotal role in shaping the minds of future generations as well as acting as a starting point for virtuous circles and responsible behavior (Cortese 2003). Embedding sustainability at universities involves taking a number of actions usually recognized as University Social Responsibility (USR) practices. The concept of responsibility has Latin origins (*responsum*) and means the responsibility to be answerable for one's behavior by accepting its consequences. Accordingly, USR considers enhancing sustainability in four main areas of action: teaching, research, governance, and the sharing of knowledge with the community. As part of a context (e.g., local, national), universities need to be both responsible and accountable for their actions.

At the same time, while riding the wave of the recent implementation of the new public management, universities are called on to be more accountable for the use of public and donated funds. The increasing range of actions that universities are required to carry out, and a wider range of stakeholders, have created new accountability needs that are not satisfied by the traditional tools, such as financial statements and budgets. Therefore, university sustainability reporting is attracting attention from practitioners and social accounting scholars. They have identified several forms of voluntary documents similar to sustainability reports, as well as several standards and numerous best practices that can shed the light on the reporting process and on how to embed this practice in universities' accounting systems.

Previous studies recognize several functions that sustainability reports can assume, such as improving the legitimacy of an organization, enhancing the organization's image, and assisting the external audit of results and goal achievement by stakeholders (Azizul Islam and Deegan 2008). In the public sector, social accounting has provided greater transparency, increasing both stakeholders' awareness of governance decisions and trust from communities. Sustainability reports have also increased the transparency of organizations' values, the use of available resources, and the results achieved through them (Vagnoni and Cavicchi 2015). These reports illustrate the mission of the organization, its efficiency, and management effectiveness, allowing stakeholders to audit the consistency between the organization's aims and its results. According to previous studies, sustainability reporting may assume different roles according to the organization that implements the process. In for-profit organizations, sustainability report serves to enhance the corporate image. In the nonprofit and the public sector, disclosing actions on sustainability may be helpful for legitimizing these organizations within the communities they serve.

Despite the growing attention on sustainability reporting by universities, social accounting studies underline that few researchers are investigating this accountability tool and that this practice is still in its infancy. Several steps must be taken to improve this process as part the accountability system at universities (del Mar Alonso-Almeida et al. 2015). This section provides a summary of the main issues related to sustainability reporting by universities that have been reported to date by scholars in this area.

## The Many Faces of Sustainability Reporting

If sustainability reporting is usually considered as the process of disclosing the sustainable actions of an organization, reports resulting from this process can vary in their forms, dimensions, and contexts. International studies have demonstrated that the three dimensions of sustainability can be differently disclosed in sustainability reports. On the other hand, reports with different titles (e.g., social reports, mandate reports) can provide information equivalent to that provided by a sustainability report. The following will describe some distinctions between these documents.

The social report (*bilan social* in France, *bilancio sociale* in Italy) assumes this title due to

its tradition in the state where it was developed. France and Italy have 40-year histories of the evolution of social accounting tools, and the social report has been one of the first examples of disclosure for stakeholders. In the past, these reports mainly contained information on social aspects; however, they now also provide data on the organizational environmental and economic performance. Despite this, they maintain their traditional name of "social report."

The environmental report highlights the sustainable nature of the university' actions, usually by referring to the Copernicus Charter. These environmental aspects are widely disclosed, for example, in Canadian universities (Fonseca et al. 2011), and embrace the measurement of performance on issues such as water consumption, green buildings, transportation, and mobility management.

Another type of report identified by Moggi et al. (2015) is the "mandate report" that is disseminated by the public universities and discloses information referred to as the "chancellor's mandate period." Comparing performance on sustainability from 3 to 5 years, this document offers a long-term view of the university's strategies and policies on teaching, research, and governance.

Sustainability reports provide disclosure for the triple bottom-line performance by considering economic, social, and environmental aspects of a university's actions. According to the literature on universities, the information provided is focused on the sustainable aspects of research, teaching, and knowledge transfer within the community. Research on sustainability usually considers the number of articles published on this stream of studies and the number and value of grants received to support projects on sustainability. Teaching aspects encompass the numbers of courses that disseminate knowledge on sustainability or general subjects including this issue. Finally, the third mission of the universities is focused on the transfer of knowledge related to environmental and social aspects and the goals that involve the local community and enhance the sharing of knowledge regarding sustainability among students, professors, and citizens.

In this sense, sustainability reporting is a valuable tool to engage stakeholders and subjects, who, once involved in the process, can increase their awareness of both their own and their universities' impacts on sustainability (Godemann et al. 2014).

## Sustainability Reporting Features and Motivations

Previous studies demonstrate that sustainability reporting at universities is an ongoing phenomenon that is still in its early days (Fonseca et al. 2011; del Mar Alonso-Almeida et al. 2015), and the universities that have developed this process are not always consistent in their implementation over time (Moggi et al. 2015). The features and contents of these documents differ widely between states, contexts, and the data disclosed. Performance is reported considering both fiscal and academic years, often not permitting a comparison between periods and universities. Sustainability reporting drives changes in the universities' accounting and reporting systems and, for this reason, takes time to become embedded in the traditional organizational procedures and processes. Data collection is a long process, usually lasting a year. For those involved in the reporting, this means that once a report is published, it is already time to start the data collection for the following year. The high level of commitment required can create resistance to change from employees, which hampers the development of this process. In addition, sustainability reporting is often not subject to specific government regulation, and the initiative to produce a sustainability report is left to the individual university. This means that the process begins with the willingness to produce such a document, usually driven by a person involved in the governance, which has expertise on sustainability and is aware of the importance of reporting their university's actions. On the other hand, when governance changes, the reporting process risks being hindered or ceased.

When seeking the reasons for sustainability reporting, the literature is wide-ranging (Azizul

Islam and Deegan 2008), but little is known regarding the higher education sector. A recent study by Moggi et al. (2015) of Italian universities underlines how the function recognized as sustainability reporting changes depending on the context of development, the nature of the university, and the evolutionary process the document undergoes within the organization.

Being transparent and communicating performance to stakeholders are two of the reasons that universities point out when describing their reports. Accounting for their actions permits the universities to create dialog with their stakeholders, in many cases giving them the opportunity to participate in the process or, more frequently, at the final reporting stage by asking for their feedback on the final document.

The literature emphasizes that many universities consider the potential of sustainability reporting in regaining legitimacy after the loss of public trust (Ntim et al. 2017). For universities, the sustainability report could be the answer to the request for increasing transparency in the use of public resources, giving stakeholders the ability to understand universities' social impacts, especially those affecting the local community and students. In this sense, the measurement required for building the social account is not limited to economic sustainability but also the broader social and environmental impacts.

It is important to note that the proper dissemination of these reporting tools strengthens the link with the region served by the university and the dialog with its stakeholders. Moggi et al. (2015) also underlined how this practice can stimulate the spread of a culture of social responsibility and sustainability in individual day-to-day actions by the people involved in the process.

## The Main Standards Applied

Sustainability reports present a methodological section where the main formal features of the document are described: the reporting period, the composition of the working group, the guidelines and the structure chosen, and the standards employed. Except for valuable recommendations issued by academic and professional organizations (see GBS 2008), there are no regulatory provisions by governments on sustainability reporting at universities.

Previous studies underline that several standards (both for the phases of the production process and for the document framework) are usually employed in creating a report. The simultaneous application of the few standards available for sustainability reporting demonstrates the incompleteness of each of them. The guidelines issued by the Global Reporting Initiative (GRI) G.4, together with Sector Supplement for the public agencies, are the most widely used framework (GRI 2005, 2013). The GRI standard is particularly useful in rationalizing through ratios the quantitative measurement of economic, social, and environmental performance. The set of indicators provided by the GRI and its implementation manuals allow the construction of each ratio.

The Copernicus Guidelines were instituted in 1993 and updated in 2006, and are considered a pivotal framework for European campuses, and extend to Canada and the United States. These guidelines aim to integrate higher education through strategies for sustainable development by providing a step-by-step path (Copernicus Campus 2006).

The Sustainable Campus Charter (GULF 2010) results from a collaboration between the International Sustainable Campus Network (ISCN) and the Global University Leader Forum (GULF) under the supervision of the World Economic Forum. The charter provides useful support for universities that approach sustainability reporting for the first time, because it presents a framework based on individual operational units of the university and is therefore easier to implement in a gradual way.

Another important role is played by the national guidelines, which are usually provided in the language of origin and are followed by the national universities. For example, in Spain, a manual on university social responsibility was published in 2011 (Vallaeys et al. 2011) providing insights both on how to develop actions for sustainability at universities and on their monitoring by measurement. In Italy, the Interest Group on

Social Reporting (GBS) proposes specific guidelines for universities (GBS 2008, 2013). This framework is easy to read and is usually used to define the general structure of the sustainability report and to describe relationships with stakeholders through a matrix stakeholders/actions. For the reporting process, the most widely diffused standard is AA1000, both in terms of the process phases and the specific stakeholder engagement actions (AA1000SES) (del Mar Alonso-Almeida et al. 2015).

## Conclusions

In the context of public and university reforms, and in which sustainability is becoming an important issue considered by university governance, sustainability reporting has contributed to strengthening the culture of measurement in higher education. This has increased awareness of universities' work, stimulated competition through comparison, and created moments for reflecting on university missions and plans.

Social accounting and its tools must be the result of a process that involves the entire organization. Further, according to the chancellors' declaration at the beginning of few university's sustainability report, the document is becoming an important management tool that permits the evaluation of results and supports strategic planning (Moggi et al. 2015).

From the previous studies, sustainability reporting is an ongoing phenomenon that is undergoing a continuous development. Sustainability reports and other social accounting documents are living tools that change and shape their content, and their functions and utility to the accounting and accountability systems continually evolve. Even in cases where published documents reveal an autoreferential approach, their development over time can enhance their conversion into helpful accountability and strategic planning tools for the evaluation of economic, social, and environmental sustainability performance over the long term.

There is no doubt that the continuity of reporting and the growing experiential curve will allow the process of internal and external data collection to advance, thereby reducing the effort required to produce the sustainability report in terms of resources spent. However, a turning point in the dissemination and quality of sustainability reports will require specific guidelines or legal provisions. This will be driven by a cultural change in the future generations, through the inclusion of sustainability issues into the academic program and universities' strategies. Governments, as well as internationally recognized organizations, will play a pivotal role in enhancing this change and forcing universities to broaden their accountability to stakeholders.

[2]Science and Technology, USDA- NRCS Fort Worth Texas, Moscow, ID, USA

## Synonyms

Agriculture policies; Sustainable agriculture; Urban food security

## Definitions

Sustainable agriculture. **Sustainable agriculture** is **farming** in **sustainable** ways, an integrated system of plant and animal production practices having a site-specific application that will over the long **term** satisfy human food and fiber needs.

Urban food security. **Urban food security** is deeply interconnected with both income and non-income dimensions of poverty. For **urban** residents, access to **food** is primarily through market purchases; hence, affordability and accessibility are key.

## Introduction: History and Context

Much of the support and effort toward establishing sustainable agriculture has been focused on the traditional rural sector. Significant research has been undertaken on sustainable agriculture in traditional rural contexts. Although sustainable agriculture has thriven in the rural context, sustainable urban agriculture (SUA) is an emerging trend that is rapidly gaining ground even though there are differences of context and scale between the two contexts. In order to understand the symbiotic relationship between sustainable agriculture and urban communities, it is necessary to first understand the history behind these essential systems. Some proponents of sustainable agriculture theorize that sustainable agriculture dates back to early attempts by humans to grow their own food. Presumably, the rationale is that prior to the industrial revolution, sustainable agriculture was practiced because applications of modern fertilizers and other modern soil amendments were not used in early agricultural practices. However, sustainable agriculture practices are not simply characterized by the absence of dependence on fertilizers and related chemical compounds. Sustainable agriculture also embraces social resilience, sustainability, economic growth, environmental conservation, and ecological systems theory.

**The emergence of sustainable agriculture dates back to the nineteenth century. Organic agriculture practices** which embrace sustainable agriculture practices date back to as early as 1840 when Justus Von Liebig developed a theory that mineral salts where the only nutrients plants needed and claimed that mineral salts could

replace manure. However, even though Liebig's claim was not validated, his greatest accomplishment was the discovery of nitrogen as an essential plant nutrient (Pogash 2008). In the 1940s, Sir Albert Howard was accredited with establishing organic agriculture as a viable alternative to the rise of industrial agriculture. Howard wrote the definitive book titled *An Agricultural Testament*, which was well received when published in 1943. In the Preface of his book, Howard lamented that "Agriculture has become unbalanced: the land is in revolt: diseases of all kinds are on the increase: in many parts of the world Nature is removing the worn-out soil by means of erosion" (Howard 1943). He succinctly addressed the question "what are the main principles underlying nature's agriculture? These can most easily be seen in operation in woods and forests." In the twenty-first century, organic agriculture represents a model for sustainable agriculture practices. Unlike other variations of sustainable agriculture, organic agriculture is certified and regulated by the US Department of Agriculture (USDA). Organic agriculture principles and practices in the UK and the USA have clearly evolved and become established over many decades since the early days of agriculture sustainability. For this reason, they are proposed as a valid model for evaluating agriculture and urban community sustainability in the twenty-first century (Pogash 2008). In the USA, sustainable agriculture was officially recognized by the USDA in the 1985 Farm Bill (Natural Sustainable Agriculture Coalition 2016). Regardless, the first Farm Bill, the 1933 Agricultural Adjustment Act (PL 73–10), targeted specific references to environmental issues of significant relevance to agriculture in America during the Great Recession. Two years after the 1933 Agricultural Adjustment Act was implemented, the Federal Government also passed the Soil Conservation Act of 1935 (PL 74–46), which established the Soil Conservation Service and made funding available for farmers who embraced soil conservation practices (Cain and Lovejoy 2004). The term "sustainable agriculture" is broadly defined. There is significant evidence of sustainable agriculture practices (also referred to as "alternative agriculture") dating back to the mid-nineteenth century. There are many variations and permutations of sustainable agriculture. Many of these "sustainable" agriculture approaches exhibit similar common principles and practices. The National Sustainable Agriculture Coalition states that sustainable agriculture "as legally defined in US Code Title 7, Section 3103, refers to an integrated system of plant and animal production practices having a site-specific application that will over the long term satisfy human food and fiber needs." These site-specific applications include the following:

- Enhancing environmental quality and the natural resource base upon which the agricultural economy depends
- Making the most efficient use of nonrenewable resources and on-farm resources and integrate, where appropriate, natural biological cycles and controls
- Sustaining the economic viability of farm operations
- Enhancing the quality of life for farmers and urban community societies as a whole (National Sustainable Agriculture Coalition 2016)

The basic goals of sustainable agriculture as practiced in the USA include achieving and sustaining environmental health, economic profitability, and social and economic equity sometimes referred to as the "three legs" of the sustainability "stool."

Sustainability rests on the principle that we must meet the needs of the present without compromising the ability of future generations to meet their own needs. Therefore, stewardship of both natural and human resources is of prime importance. Stewardship involves taking care of the land, supporting sustainable economies, and preserving/enhancing natural resources, community resilience, and environment health. Another asset of agricultural sustainability is the systems approach, which in its broadest sense is based on establishing direct, seamless connections from local farms to urban communities in a manner respectful of surrounding environmental contexts and the enhancement of ecological integrity.

A systems approach is based on the ecosystems model as a foundational principle of sustainable agriculture and the interconnections between farming, urban and rural communities, and complex characteristics of environment. Sustainable agriculture is fundamentally a process. All participants in the system, including communities, farmers, laborers, policymakers, researchers, retailers, and consumers, must adhere to the systems approach for this sustainable systems process to succeed.

Sustainable agriculture and urban food security are a natural link. Local foods, accessible processing, distribution, and local markets connect to healthy communities, jobs, and economic development. Government and nongovernmental underlying supports of farm and ranchland preservation, environmental performance, and social or human aspects all work to connect a fully functioning local area food system. Urban agriculture is part of the local food system where food is produced within an urban area and marketed to consumers within that area. Urban farming can also include animal husbandry (e.g., breeding and raising livestock), beekeeping, aquaculture (e.g., fish farming), aquaponics (e.g., integrating fish farming and agriculture), vertical farming, and nonfood products such as producing seeds, cultivating seedlings, and growing flowers. Urban farms can also contribute to the revitalization of abandoned or underutilized urban land, social and economic benefits to urban communities, and beneficial impacts on the urban landscape. USDA EPA urban farming operations represent a diverse range of systems and practices. They encompass large-scale innovative systems and capital-intensive operations, vertical and rooftop farms, hydroponic greenhouses (e.g., systems not using mineralized soil), and aquaponics facilities (e.g., growing fish and plants together in an integrated system). Urban farming also includes a range of operations such as vacant city lots, city parks, churchyards, schoolyards, backyards, and community gardens. This diversity has resulted in a lack of consensus about what constitutes an urban farm. In 2018, Congressional research service passed farm bill primer, which provides additional support for urban, indoor, and other emerging agriculture production, creating new programs and authorities and providing additional funding for such operations. The law also combines and expands existing programs that are run by US Department of Agriculture (USDA) to provide financial and resource management support for local and regional food production. In addition, urban agriculture can create a focal point on farming to increase food security, particularly in low-income neighborhoods, and includes community building and education.

## The Emergence of Urban Agriculture

The twenty-first century has often been described as "the first urban century." Unprecedented rural-urban migration has led to rapid urban growth. However, in 1900 a mere 13% of the world's population lived in urban areas. The world population will reach 9 billion by 2050. To meet the global food demands of an increasing population along with dietary changes, twenty-first-century agriculture needs to produce 60% more food. At the same time, roughly one-third of the food (1.3 billion tons per year) is lost or wasted throughout the supply chain with enormous financial and environmental cost (United Nations 2016). Furthermore, virtually all of this population growth over the next few decades will be absorbed by cities in low- and middle-income countries, thus increasing the pressure on urban resources and administrations that are often already exhausted. Up until the first half of the twentieth century, traditionally rural communities existed in a symbiotic relationship with agriculture. Small farmers relied on access to local services and markets, sustaining resilient rural communities. In the 1940s, industrial agriculture was introduced in the USA on a large scale. Sustainable agriculture was in many ways a push back on industrial agriculture (Howard 1943). To evolve farming systems that meet all of these demands, twenty-first-century international agricultural policy, research programs, and food markets need to shift away from emphasizing low-cost and high-production systems and return to a holistic perspective of how farms provide benefits to the

farmers and urban communities (The National Academies of Sciences, Engineering, Medicine 2010).

Today, US and UK farmers are under pressure to satisfy multiple, often competing demands such as producing more crops, less pollution, fulfilling consumer preferences, paying fair wages, and making a living – all with increasingly scarce natural resources such as land and water. Compounding these twenty-first-century challenges on agricultural practices, in the 1950s, urbanization of agricultural lands coupled with continued increases in population pushed urban development out from urban centers and into the rural countryside. From post-World War II to present, rapid urban growth in the USA has extensively encroached on agriculture lands, turning a significant number of square miles of farmland into pavement, homes, and shops.

However, in the 1990s, several promising new urban planning concepts emerged including landscape urbanism. Landscape urbanism borrows from and builds on the rich history of urban design in response to nature as practiced by Olmstead, Spirn, McHarg, and others. Landscape urbanism embraces urban and rural agriculture. The landscape urbanism planning concept is one of the several current and emerging urban planning theories that have influenced urban development over the last two decades. A common factor of all these urban planning concepts is the infusion of nature into the urban environment (Smith 2015). The current trend toward urban farming coincides with the emerging influence of these urban factors. The National Geographic reports that more people around the world are taking a look at urban farming, which offers to make food as "local" as possible. Growing what we need near where we live, we decrease the "food miles" associated with long-distance transportation. We also get the freshest produce money can buy, and we are encouraged to eat in season (National Geographic 2016). In the twenty-first-century USA, two solutions have been proposed and generally accepted as viable alternatives to industrial agriculture, these being (a) the incremental approach, in which ongoing endeavors to develop sustainable agricultural techniques are expanded, and (b) transformative approach, in which multiple research areas are brought together to design farming systems that balance the competing demands from the outset. These approaches are listed below:

1. **Incremental approach**: the incremental approach expands and enhances ongoing efforts to improve sustainability on all farms, irrespective of size or farm type. The goal is to identify and develop farming techniques that can improve specific aspects of sustainability, such as new strategies for water conservation, pest management, novel marketing approaches for increasing farm income, and accelerating their adoption (The National Academies 2010). One example is "conservation agriculture (CA)," which combines reduction in tillage practices with appropriate crop rotations to boost productivity and improve soil quality (Food Alliance 2016).
2. **Transformative approach**: this approach seeks to design farming systems that balance the four goals of sustainability from the outset (see Table 1). These systems might depart significantly from the present-day mainstream of agricultural production in the USA and would require new thinking about farming practices and the natural environment, food markets, and communities in which they are embedded. Multidisciplinary research on aspects of these novel farm systems would be needed to develop a knowledge base to inform future policies and practices. Some insights could be gained from examining the differences among existing farm types or practices (National Academies 2010). If a technology works to improve productivity for the farmers and causes no harm to the environment, it means that it has sustainability benefits (Pretty 2008).

Sustainability is a balancing act involving a balance between a range of agricultural and environmental goods and services. Sustainable practices enable sustainable agriculture practitioners to produce healthy, available, and affordable food and other goods for public consumption. In this manner, sustainable practices contribute to a range

of valued public goods, such as clean water, wildlife and habitats, carbon sequestration, flood protection, groundwater recharge, landscape amenity value, and leisure/tourism (Dobbs and Pretty 2004). Sustainability concepts embrace intensification of resources and conserve existing resources (e.g., land, water, biodiversity) and technologies. Intensification using natural, social, and human capital assets, combined with the use of best available technologies and inputs (best genotypes and best ecological management) that minimize or eliminate harm to the environment, is "sustainable intensification" (Conway and Pretty 1991).

Among the most pressing needs of any urban agglomeration is the question of urban food security and ensuring the right to food. Urban populations depend on the reliable and stable availability of food products, as well as affordable and convenient access to them. High levels of urban income poverty paired with rising food prices, however, often make the formal urban food supply system unaffordable and inaccessible to the urban poor. An informal supply system, consisting of street vendors, informal markets, home-based enterprises, as well as urban agriculture (UA), exists alongside formal interventions. These informal networks predominantly satisfy the urban poor's demand for easily accessible – though not often cheaper – foodstuffs.

## Urban Agriculture and Food Security

Urban agriculture is a much-celebrated part of the burgeoning local food movement aimed at improving food access among low-income communities in urban areas. Without understanding the actual links between UA and food security or which specific characteristics, models, or approaches reduce insecurity, it is not possible to initiate any solution.

UA is thought to increase food security through two main pathways: improved access to food and increased income (Mougeot 2005). Homegrown foodstuffs increase the total amount of food available to a household and thus can prevent hunger and malnutrition. At the same time, the availability of fresh, homegrown food products, in particular fruits and vegetables, advances the nutritional status of household members and thereby improves health. Direct access to food often allows particularly poor households to consume a more diverse diet than they would otherwise be able to afford. Especially, animal husbandry is believed to provide an important source of animal protein, which is commonly limited in poor households' diets due to income constraints. Recent studies on UA and its impact on nutrition focus on dietary diversity and kilocalorie consumption as two main aspects which influence the outcome of improved nutrition (Zezza and Tascotti 2010).

It is important to note that the potential for UA to improve food security under either of the two "opportunity cost" pathways listed above (and illustrated in Fig. 1) depends on the inefficiency within the current system to allow scope for improvements. It will not in all cases be more economically efficient for households to grow their own food as opposed to engaging in other productive activities or buying food from the market.

## Religion, Ethnicity, and Role of Women in Urban Agriculture

**Religion and ethnicity.** Sharing food is a fundamental part of many religions. Faith-based organizations have historically contributed to humanitarian aid worldwide, many of them with a focus on alleviating hunger and promoting food security. Food Tank is excited to highlight 24 faith-based organizations fighting food insecurity around the globe.

**Role of women in urban agriculture**. The number of women farmers has nearly tripled over the past 30 years, with most operating small farms in the fastest-growing segment of agriculture – specialty crops and livestock. When the National Young Farmers Coalition (NYFC) surveyed more than 3500 farmers under 40 in 2017, 60% of the farmer respondents were women. And in 2012, the US Department of Agriculture (USDA) Census of Agriculture found that 14%

**Sustainable Agriculture and Urban Food Security, Fig. 1** Two key pathways for UA to food security (Environmental Evidence Journal 2014)

of principal farm operators were women, a nearly 300% increase since 1978, when it began counting women as farmers.

Local nonprofits are often the primary facilitators of urban agriculture. Nonprofits often perceive themselves as pioneers and are playing crucial roles in developing innovations. Along with community-based organizations, nonprofits have the closest relationship with, and are most supportive of, urban farmers, especially the poorest and most disenfranchised. Nonprofits can serve as links between farmers and the market, credit agencies, research institutions, and the government. They assist through a number of means – empowerment and general organization; technical assistance; extension and training; access to land, credit, insurance, and inputs; and organizing markets and market information. Similar to farmers' associations, nonprofits can remove constraints that hamper small-scale farmers and push governments and other institutions for policy changes (Fig. 1).

Many organizations see urban agriculture as a way to enhance food security. It also offers environmental, health, and social benefits. Although the full potential of urban agriculture is still to be determined, it has been found that raising fresh fruits, vegetables, and some animal products near consumers in urban areas can improve local food security and nutrition, especially for underserved communities.

Schools and youth organizations. FFA provides urban students with numerous positive outcomes which have been cited as important for urban youth according to urban youth development research (Larson et al. 2005; Wood et al.

**Sustainable Agriculture and Urban Food Security, Fig. 2** Growing community with local and regional food systems (Environmental Evidence Journal 2014)

2009). Furthermore, school-based agriculture programs are designed to include classroom instruction, supervised agricultural experiences, and membership in the FFA (Phipps et al. 2008); thus, urban agriculture students who choose not to become involved in FFA activities may not be receiving the full benefits of the school-based agriculture experience. Like local farmland protections, zoning regulations to allow chickens and small animal production, Community gardens, food banks, and urban production strategies. Immigrant, religion and ethnic examples pushing local access and urban agriculture (Fig. 2).

## Case Study Example

In Texas, the natural resources program addresses educational needs related to the management, use, and sustainability of renewable and nonrenewable natural resources. Drawing on a variety of disciplines, these programs in many schools typically focus on such topics as soil, water, air, plant and animal life, forests, rangeland, and aquatic and other ecosystems. There are some programs, resources, and opportunities available through the Texas A&M AgriLife Extension Service, University of North Texas (UNT) at Dallas, Dallas community colleges, etc.

The urban horticulture research program led by UNT at Dallas Center focuses on developing production and best management practices to address challenges facing the emerging controlled environment agriculture industry for controlled systems in urban agriculture including greenhouses and indoor vertical farms. For the growing conditions such as light, temperature, and humidity fluctuate inside a greenhouse as seasons change and with these changes the crop performance and productivity. The aim of the program is to address all these variables in developing best management practices for major greenhouse production systems. These include nutrient film technique and deep water culture in order to seek and reduce energy costs, maximize productivity, and enhance produce quality.

Urban Agriculture and Renewable Resources is a new degree plan at UNT Dallas, which has a unique curriculum that gives students hands-on experiences in agriculture. The UNT Dallas degree plan is the only one in Dallas-Fort Worth that focuses on agriculture in an urban environment. The Urban Agriculture and Renewable Resources course work prepares students for careers that have a direct positive impact on peoples' everyday lives. A Bachelor of Applied Arts and Sciences degree allows students to easily transfer credits from community college, which makes this an affordable

pathway to pursue a bachelor's degree at UNT Dallas. UNT Dallas has partnered with El Centro College (Dallas County Community College District) to create a seamless transfer process.

## Conclusion

Sustainability is the achievement of a balance between social, economic, and environmental needs that will sustain the planet and its population for the foreseeable future. Sustainable agriculture addresses this balance by supporting and facilitating resilient social, economic, and environmental sustainability in urban contexts. Adopting and evolving a common baseline of parameters and principles can strengthen sustainable agriculture practice as a whole, enabling it to adapt and flourish in urban communities.

The traditional/macro perspective typically sees primary food production as a rural activity although food processing, distribution, and consumption may take place in cities and metropolitan regions. Urban agriculture is essentially a small-scale activity, involving backyard growing for personal consumption alongside community gardens, as well as a range of communal food-growing activities (including food swaps, guerrilla gardening, and permablitzing). While peri-urban market gardening may once have supplied a significant proportion of food for cities, the loss of peri-urban land to suburban expansion is accepted as an inevitable consequence of the growth of cities. From this perspective, there is little prospect of urban food production making a significant contribution to overall patterns of urban food consumption or to urban food security. Yet at the same time, the critical/micro perspective tends to attach greater significance to what already takes place under the broad heading of contemporary urban agriculture and to see greater potential for it to play a much more prominent role in the future as existing systems struggle to deal with increasing perturbations.

# Sustainable Development Administration

Hartmut Fünfgeld
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Synonyms

Development administration

## Definition

The term "sustainable development administration" describes an aspect of public policy that is concerned with the application of the sustainable development paradigm to public administration structures, processes, and institutions. "Administration" here relates to a broad array of operational processes and discrete tasks that facilitate the development and implementation of public sector policies – though the term is also used in relation to private sector operations.

## Introduction

Aligned with the definition set out above, sustainable development administration primarily refers to the institutional and administrative structures and processes within public administration that facilitate and enhance sustainable development as the global development paradigm agreed to at the international scale at the Rio Earth Summit in 1992 and subsequently reiterated in Rio+20 (2012) and the Sustainable Development Goals (SDGs) agreed to by the member states in 2015.

From a contemporary vantage point, sustainable development administration can be considered as the administrative and operational side of the sustainable development agenda, as it is promoted and implemented through the SDGs, for example.

This view, however, ignores the origins of sustainable development administration in modernist paradigms of *development* and *development administration*, which emerged in the post–World War II world. Since the 1970s, international development has undergone a transformation towards more holistic approaches that not only take economic growth but also social development and ecological conservation into account, in line with sustainability thinking. Sustainable development administration therefore is not a new area of public policy but one that gradually emerged over the past three to four decades, as the international community tried to learn from past mistakes in international development while it, at the same time, embraced sustainable development as its new paradigm.

## Development Administration as a "Big Government" Instrument of Modernization

The origins of development administration can be traced back to the 1950s, as an area of practice and research within what can be termed *comparative public administration*. Beginning in the late 1940s, numerous countries in Africa, Asia, and Latin America achieved independence from colonial rule. The historical shifts that led to independent nations had raised hope for improved social and economic conditions under now liberated governments, while former colonial powers sought to maintain economic ties with their former colonies and (in some cases) provide support in the political transition process through international development aid. The majority of these "Third World" countries, however, were economically weak, with impoverished societies facing significant domestic political and social challenges that – such was the *Zeitgeist* of the time – could only be met with Keynesian economics and big government (Esman 1988). Strong and far-reaching government action, such as the one that led to the creation of the Marshall Plan in Europe, was considered the means of choice for tackling poverty and fostering social progress.

At the same time, the social sciences, which have expanded in significance since the 1950s, were dominated by a modernization paradigm that posited the universal validity of Western values, including individualism, instrumental rationalism, and enlightenment through science. Eventually, so the view, all peoples and nations around the world would adopt Western normative systems and reap the social and economic benefits of doing so, just as Europe and North America had. This assumed cultural supremacy of the West and the belief in a linear trajectory of development and change towards more Westernized societies with similar political and administrative system would take place through technical assistance from countries in Europe, North America, and Oceania, who would work with well-educated elites in developing countries, who in turn acted as "modernizers" that took Western, rational forms of planning, decision-making, and implementation from increasingly "modernized" urban centers to the rural periphery (Esman 1988).

In this setting, public administration using big government was considered the most important and most effective vehicle for guiding such a process of transition and achieving modernization. Hence, development administration was born as a specialized field within public administration, built on the fundamental assumption that the various manifestations of development *can* in fact be administered by building powerful bureaucracies. As developing countries strived towards the Western ideal of modernization, their actual administrative needs were considered different from those of developed countries – albeit not in a way that they were believed to differ significantly from one developing country to the next. All developing countries, it was argued, needed to rapidly mature their public administrative systems (including developing bigger government structures that could deal with the enormity of the task) in order to improve their social and economic conditions. Public administration in a developing country context, therefore, required dedicated modernization concepts, approaches, and administrative practices that were able to not only cope with but catalyze constructing national infrastructure, facilitate democratic planning and decision-making processes, ensuring the primacy of the rule of law, and raising the standard of living (Gant 2006). Development administration, therefore, took on an optimistic yet largely culturally insensitive perspective that viewed developmental problems as transient and inherently solvable – and effective public administration would need to play a major role in the task.

In this context of a global strive for modernization, development administration can have two different goals: to achieve the development of administration in developing countries or to administer development processes in developing countries (Riggs 1970). Throughout the 1970s and 1980s, the second focus become more prominent and the term development administration evolved into a synonym for the administration of development in developing countries.

In the 1970s and 1980s, the achievements of big government in developing countries stayed far behind its modernistic expectations and promises. Suffering from formalistic, bureaucratic, and vastly ineffective procedures that involved large numbers of often poorly skilled public servants, public administration became increasingly seen as the problem rather than the solution for developmental challenges. Development administration attracted critiques similar to those of the modernization model of development as such. In essence, public administrations were not able to act as effective agents that could carry social and economic progress into all geographic corners of a nation – rather, much development efforts were not reaching the majority of poor people, development projects were not reaching their objectives, and whole public sectors became mired in intransparency, corruption, and nepotism that amounted to being complicit in, if not directly responsible for, worsening socioeconomic conditions.

As a subdiscipline, development administration was never very clearly defined, beyond existing paradigms of modernization. Despite its direct emergence from theories of development, only few attempts were made within the field of development administration to define how it understood "development." The implicit interpretation inherent in most development

administration approaches and practices was one where economic development was foregrounded, often with the result that other conceptualizations of development appeared virtually nonexistent or considered radical and non-mainstream. The lack of theoretical engagement with the very foundation of the term also manifested in that development administration scholars and practitioners seemed to lack interest in critiquing the field from within. Mostly on the outside of the field, however, critics argued that development administration was a manifestation of Western hegemony of liberal-democratic values that it imposed onto non-Western cultures in unsuitable ways. Not only were Western administrative ideas at odds with traditional administrative and decision-making processes in developing countries; applying development administration to such countries also highlighted that the institutional structures and processes it relied on were far from perfect and often did not work as effectively and efficiently in developed countries to justify "exporting" them and convincing other countries to adopt them as best practices. Ultimately, the notion of development as a linear process that all countries or societies will undergo in a similar way was considered no longer tenable as there was little evidence in more developed countries that this was the case. This realization resulted in the rapid demise of the subfield of development administration.

## From New Development Administration to Sustainable Development Administration

In the late 1980s, after development administration as a professional subfield of public administration and area of research and training had all but disappeared, some scholars made an unsuccessful attempt of a rebirth by referring to *new development administration* (NDA; Esman 1988). Instead of providing alternative theoretical and conceptual approaches to the question of how public administration can achieve lasting change in developing countries, NDA mostly offered a reactive approach to changing economic and political paradigms towards neoliberal approaches that embraced minimal government, privatization, and deregulation.

The late 1980s, however, also saw the widespread adoption of the concept of sustainable development, catalyzed to the forefront of international development politics and public administration by the 1987 *World Commission on Environment and Development* (WCED 1987) report "Our Common Future" (widely known as the Brundtland Commission report). The Brundtland Commission defined sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED 1987). According to this most widely accepted definition, sustainable development is both sensitive to existing resources and their use, while also acknowledging that society has social and economic needs that are to be met.

The WCED identified six objectives of sustainable development that further spell out these needs:

1. Reviving growth
2. Changing the quality of growth
3. Meeting essential needs for jobs, food, energy, water, and sanitation
4. Conserving and enhancing the resource base
5. Reorienting technology and managing risk
6. Merging environmental and economic decision-making.

In summary, these objectives equate to two underlying goals, namely, that resource exploitation should be renewable and thus equal to regeneration rates and that the emission of different forms of waste should stay within the natural assimilative and absorptive capacity of ecosystems (Carley and Christie 1993). A core principle of this definition is intergenerational equity. Sustainable development thus clearly stretches the notion of development away from a sole focus on the present onto one that takes future resource availability and future societal needs into account.

The emerging sustainable development paradigm gave new impetus to debates about how development, now framed in terms of resource

efficiency, ecosystem health, and intergenerational equity, can be facilitated as a sustainable process. Sustainable development administration is no longer primarily focused on how (linear) development can be administered but what strategies can be employed to establish the ideal of sustainable development as a new and lasting practice. Sustainable development administration therefore signifies a move in public administration to support a holistic societal transition to sustainable practices, rather than being an approach for facilitating economic development. Inherent to this is the assumption that collective effort will be required across disciplines, sectors, and societies in order to devise more sustainable strategies and implement them in differing institutional contexts. To achieve structural and behavioral change towards more sustainable practices, sustainable development acknowledges cultural diversity and calls for culturally sensitive approaches developed from within a given cultural context, rather than promoting one-size-fits-all technocratic solutions.

As an important conceptual departure from previous paradigms of development with important global political implications, sustainable development applies to both developed and developing countries and sees learning and transfer of knowledge to occur in both directions – at least it is open to such cross-fertilization in theoretical terms even though the international development aid programs remain largely focused on transfer of sustainable technology and expertise in sustainable development from the global North to the South. While developed countries may harbor advanced economies and sophisticated administrations, they may be poorly developed in terms of resource efficiency and waste minimization, leaving behind degraded ecosystems for future generations. Therefore, sustainable development asks countries to limit and transform all practices that are harmful to ecosystems, including managing population growth, resource use, and the production of pollutants and other waste products. More recently, since the global acceptance of anthropogenic climate change, sustainable development also encompasses reducing global greenhouse gas emissions and ensuring that societies can adapt to changes in the global climate and avoid suffering severe consequences.

Sustainable development was adopted as the new global paradigm for development at the 1992 Earth Summit in Rio de Janeiro. At the Rio+20 conference in 2012, the United Nations member states renewed their commitment to sustainable development as the guiding principle for all development efforts across the globe, paving the way for a global agenda on sustainable development agreed upon by the global community in the form of the 17 Sustainable Development Goals (SDGs) in 2015, which are supported by 169 targets. The SDGs are:

1. End poverty in all its forms everywhere
2. End hunger, achieve food security and improved nutrition, and promote sustainable agriculture
3. Ensure healthy lives and promote well-being for all at all ages
4. Ensure inclusive and equitable quality education and promote life-long learning opportunities for all
5. Achieve gender equality and empower all women and girls
6. Ensure availability and sustainable management of water and sanitation for all
7. Ensure access to affordable, reliable, sustainable, and modern energy for all
8. Promote sustained, inclusive, and sustainable economic growth; full and productive employment; and decent work for all
9. Build resilient infrastructure, promote inclusive and sustainable industrialization, and foster innovation
10. Reduce inequality within and among countries
11. Make cities and human settlements inclusive, safe, resilient, and sustainable
12. Ensure sustainable consumption and production patterns
13. Tackle urgent action to combat climate change and its impacts
14. Conserve and sustainably use the oceans, seas, and marine resources for sustainable development

15. Protect, restore, and promote sustainable use of terrestrial ecosystems; sustainably manage forests; combat desertification; and halt and reverse land degradation and halt biodiversity loss
16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels
17. Strengthen the means of implementation and revitalize the global partnership for sustainable development.

## Sustainable Development Administration: Invigorated Role for Public Administration Under the SDGs

The paradigm shift away from economic development and otherwise compartmentalized yet linear approaches towards trajectories of sustainable development that do not degrade natural resources and minimize harm to ecosystems and humans coincided with transformational social and technological changes, such as increasingly ubiquitous migration and mobility and the arrival of the Internet and fast and efficient means for global communication. If development administration – and public administration in general – was to shift towards achieving more holistic goals for development, it needed to change tack and capture the opportunities provided by increasingly networked societies, as well as come to terms with the inherent complexity and multiscalar, multiactor nature of sustainable development. This not only required gradual adjustment of existing administrative processes within governmental and other public sector institutions; beyond that, it called for significantly re-thinking the role of government itself in an increasingly connected and globalized world. At the same time, sustainable development administration is also bound by largely unchallenged paradigms of *new public management* that favors adopting private sector approaches to reduce overly bureaucratic processes, increase efficiency, and focus on providing effective end user services to citizens, who are considered "customers."

This complex set of institutional and social paradigms and trends was confounded by the difficulty of making sense of sustainable development as it related to public administration – beyond obvious sectors such as environmental and natural resource management where the principles of sustainable development can be readily applied. While development administration lacked theoretical depth and critical engagement with underpinning concepts, SDA grapples with the opposite problem: the broad conceptual focus of sustainable development and the translation thereof into operational practice, across sectors and institutions. The SDGs were useful in this regard: not only did they set the global policy agenda, they also placed boundaries around the meaning of sustainable development for different spheres of human and nonhuman life and, through defining concrete goals, articulated clear expectations on governments who were to implement and administer strategies through their public administrative systems. Subsequently, the Rio+20 conference output document provided important, overarching guidance on how public administration will be required to transform in order to become fully aligned with the SDGs and support their implementation. This guidance included the following principles (UN-DESA 2015: 77f):

1. Broad, active, and meaningful participation in decision-making, planning and implementation of policies and programs for sustainable development at all levels
2. Improved access to ICT, especially broadband networks, and access to government proceedings, regulations, data, and easy-to-understand procedures
3. National regulatory and policy frameworks that enable business and industry to advance sustainable development initiatives
4. Well-functioning institutions at all levels those are able to demonstrate transparency and accountability mechanisms as well as the capacity to achieve and demonstrate results
5. An integrated approach to planning and building sustainable cities and urban settlements, including strengthening local authorities and

the participation of urban residents in decision-making
6. Combatting corruption in all of its manifestations

These new principles for sustainable development administration represent both a reinvigoration of globally accepted standards for good public management and a shift of focus towards justice and security, regulatory control, and the delivery of services considered essential for enabling sustainable development. They also signify a far greater focus on people-centered administration and on noneconomic dimensions of development, including investing in human capital through education and health, and safeguarding natural assets through environmental protection and sustainable management of natural resources.

Inherently – and fully aligned with the spirit of the SDGs – these principles call for the ongoing development of public administration itself into more sustainable pathways that take ecological, social, and economic considerations into account. Capacity building of and for the public sector, it has been argued, can "become the key to transforming governance and integrity, improve skills, boost professionalism and mobilize citizens to become involved, thus generating a positive effect on democracy and development alike" (Zarrouk 2014: 2).

## Conclusion

Sustainable development implies a pluralist view of knowledge, where development approaches and programs devised are challenged to respond to local social, cultural, and economic circumstances in order to produce the desired results. Likewise, sustainable development administration needs to accept pluralist approaches, while adhering to globally agreed principles of good public administration and management. Since development administration evolved into a subfield of public administration after World War II, much has changed in the public administration of developmental processes across scales. The emergence and global adoption of sustainable development has brought about a shift towards more holistic thinking in administration, where social and environmental principles have a stronger weight than ever before – yet the principles of effectiveness and efficiency in using public funds continue to prevail.

Sustainable development administration faces many challenges, including how to contribute to transformation of sectors, organizations, and individual behavior while also satisfying criteria of resource efficiency and transparent and democratic decision-making. The tasks required of sustainable development administration have broadened in scope and remit when compared to the early days of development administration; at the same time, technological and communicative instruments that public authorities can use have multiplied and diversified. The interconnectedness of many of the problems at the heart of unsustainable development, however, demand that public administrators find innovative solutions for supporting and implementing politically and institutionally complex and increasingly multilayered processes. In this sense, it will not be sufficient for sustainable development administration to be merely about administering sustainable development; it will need to lift its game and develop in its own right in order to be able to address the most pressing global challenges, as they have been articulated in the SDGs.

## Synonyms

Agenda 2030; Bureaucracy; Contemporary bureaucracies; Implications of contemporary bureaucracies; Public service bureaucracies; Sustainability; Sustainable development; Sustainable Development Framework (SDF)

## Definition

The global Sustainable Development Framework (SDF) published by the United Nations in December 2012 advanced in January 2016 into what has now become known as the UN Sustainable Development Agenda 2030 defining 17 universal goals and 169 targets for the pursuit and attainment of global sustainable development. However, the global sustainability journey has yet failed to advance at the pace that is otherwise expected, due to the co-action and interactions of many complex interrelated limiting factors and variables, in what some have rightly referred to as a "wicked problem." This research interrogates how modern bureaucracy and its social consequences bother on the full implementation of the global Sustainable Development Agenda while also discussing implications for the global sustainability challenge.

## Introduction

Bureaucracy, the often complex, convoluted, and centralized hierarchical administrative and decision-making structure that powers and regulates the activities of modern governments, corporations, commerce, and industry, has become an intricate feature of contemporary living, which effects can typically be felt rather tangibly across the personal, corporate, government, political, business, commercial, as well as other circles of twenty-first-century life. Even though the intentions behind establishing bureaucratic structures are sometimes justified by propositions of structure, optimization, order, and efficiency, unwitting and inadvertent malformations in contemporary bureaucratic structures and processes could render them dysfunctional and often portend tragic and far-reaching degenerative consequences for subsistence and sustainability across multiple fronts; and this, perhaps, explains why modern theories of management and administration seek to do away with bureaucracy or at best minimize it to only that which is necessary.

Modern bureaucracies often comprise a body of officials who are appointed to represent an elected government persona, as well as a group of administrative individuals that enact policies that aim to guide and organize the running of affairs within a polity and public service. When such bureaucracies assume a coercive, rigid, and immutable structure, the resulting stiffness is able to strangle empowerment and innovation, breed dissatisfaction by suffocating ingenuity, misrepresent policy and communication, engender negligence and irresponsibility, truncate personal and professional development, deflate trust, disable cooperative synergy, foster impunity and nepotism, and lead to festering acts of avarice,

selfishness, and exploitation across the various sectors of the public civil, military, and paramilitary service and in the long run maligning efforts at representative leadership and increasing resistance to progressive change. Because indeed, whether or not a particular transformative leadership process for progressive change within an organization would be embraced by the workforce and turn out successful depends greatly on the past and existing bureaucratic structure(s) in place within the organization, since it has been repeatedly confirmed that the far-reaching negative effects of rigid and coercive organizational bureaucracies effectively transcend and superimpose on the dynamic nature of administrative leaderships within such organizations.

A recent study that investigated the impact of bureaucratic structures in a national police force discovered the pyramidal organizational structure of the force, coupled with the inverted pyramidal flow of resources allocation to be the harbinger of various counteractive realities that hamper the progress and effective operations of the force's mandates. The situation being that few force officials at the top receive a vast preponderance of limited resources as bureaucratic allocations but yet are not directly involved in the actual execution of the daily dispatch operations of the force. The rigid abstraction of command also makes it impossible for subordinates to get access to the higher ranks of command except through supervisors who are only able to establish contingence between their direct higher-ranking superiors and lower-ranking subordinates. As a result, lower-level dispatch officers are left to bemoan challenges of mistrust, information and resource deficiencies, policy inconsistencies that become contradictory between promulgation and implementation, malicious misinterpretations of policies for malicious purposes, and worn-out channels and envoys of downward communication, among many other challenges, a situation where effective whistle-blowing against corrupt practices by superiors is almost circumspectly maimed (Wang 2015).

This scenario limpidly paints the rather disheartening reality of the extent to which contemporary bureaucracies are able to clog the wheels of subsistence, development, and sustainability in sectors of the modern public service, with consequences that could be far-reaching and indeed daunting.

In this chapter, the social consequences of contemporary bureaucracies are presented as contained in the existing body of knowledge while attempting to succinctly summarize the trail of existing knowledge on the effects of bureaucracies on modern societies, social structures, and the public service sectors; and then using a systematic and associative descriptive analysis, the implications for global sustainable development are also herein discussed in a bid to contribute progressively to contemporary discussions regarding how modern bureaucratic structures and processes impact on the global sustainability agenda. However, while the government public service sector, predominantly of Western civilization, would provide a contingent, widely available, and more accessible viewing lens for the discussions in this chapter, the argued realities remain germane and instructive of the wider and far-reaching implications, the more so for developing and underdeveloped civilizations that bureaucracies (viewed through any other lenses) and its social consequences could have on building sustainable societies that meet global standards.

## Sustainable Development Agenda 2030: An Overview

In December 2012, the United Nations (UN) published the draft document for a global Sustainable Development Framework (SDF), which among other goals seeks to foster and engender the adoption of sustainable means in the pursuit of humanity's various developmental ends. This framework called for the pursuit of sustainable development along the broad quadripartite panels of economic development, environmental sustainability, social inclusion, and good governance. Thus, we came to know sustainable development as the advancement of economic development that is not pursued at the expense of environmental sustainability and broad-based

social inclusion/equality while incorporating good governance. The propositions of this framework has been lauded and welcomed among other reasons because it takes into cognizance the realization that a society that seeks to progress at the expense of environmental subsistence, with disregard for social equality and repressed societal classes and with corrupt, impunitive governance, is bound to self-destruct on its own terms, sooner than later. Six years have now passed since the draft SDF was published by the UN, and 3 years have also passed since the Agenda 2030 defining the 17 goals for the pursuit and attainment of sustainable development went into force in January 2016. Figure 1 presents a graphical summary of the 17 universal goals of the Agenda 2030.

In summary, the global sustainability Agenda 2030 aims to end all forms of poverty around the world; improve nutrition and food security by promoting sustainable agriculture, toward ending hunger; pursue optimal health and well-being for every global citizen, regardless of age; ensure quality education that is inclusive and equitable, providing opportunities for lifelong learning for everyone; pursue gender equality and empowerment of female citizens; ensure that everyone has access to clean, portable water that is sustainably managed, as well as healthy sanitation practices; and avail access to clean energy for everyone, which is sustainable, affordable, and reliable, among 17 audacious goals that have formed the foundations of global sustainable development (United Nations 2018).

More relevantly to the focus of this chapter are goal numbers 10 and 16, which seek to bridge the margins of income inequality both within and among nations and foster societies that are peaceful and inclusive by upholding public systems of justice and building institutions that are accountable, effective, and inclusive at all levels. Hence, subsequent sections of this chapter proceed as follows. Section "Contemporary Bureaucratic Structures, Processes, Leadership, and Perspectives: A Pinhole View" reviews contemporary bureaucratic structures, processes, leadership, and perspectives, as well as their social consequences, before discussing how these impact on

**Sustainable Development and the Social Consequence of Bureaucracy, Fig. 1** Universal goals of the global Sustainable Development Agenda 2030. (Source: United Nations)

the pursuit and attainment of goal numbers 10 and 16 of the global sustainability Agenda 2030 from a broadened viewpoint.

## Contemporary Bureaucratic Structures, Processes, Leadership, and Perspectives: A Pinhole View

There exists a fairly general consensus among various contemporary sources that align with Weber's agelong proposition that ideal bureaucracies should be structured in such a way as to relate to a particular domain of activity that has to be guided by regulations; have a hierarchical organization; take action only as specified by well-defined rules, which action(s) must be preserved as documented records; necessitate expert training in certain (critical) areas of involvement; motivate officials into devoting their total capacity to meeting their bureaucratic responsibilities; and rely on general rules that are consistent and teachable, for managing the various operations of the bureau. These are provably the wider accepted features that contemporary bureaucratic structures are ideally expected to reflect (Weber 1958).

Through this viewing lens, many existing sources allude and give voice to one or more of three distinct classes or categories of contemporary bureaucracies, viz., (1) the *monopolistic* bureaucracy, where full powers are vested in a single bureaucratic institution, framework, or other persona for the administration or operation of particular roles, responsibilities, and mandates; (2) the *competing* bureaucracy, where multiple bureaucratic personas are substitutable in their roles, operations, and procedures, as specified by their mandates; and (3) the *complementary* bureaucracy, where the roles, operations, and procedures of multiple bureaucratic personas are mutually supportive and supplementary of multiple other bureaucratic personas within particular polities. However, contemporary societies often incorporate a mixed and sometimes encapsulated abstraction of these various bureaucratic categories across different depths and breadths of the government hierarchies and public service sectors.

According to these various existing sources, the aforementioned three contemporary bureaucratic classes/categories thrive across three panels of realities: *structure* (relating to the manner in which their agencies and institutions are organized), *operations/processes* (the nature of the activities and involvements that are mandated for such agencies and institutions), and *procedures* (the policies and regulations that guide the extent and validity of involvements of such agencies and institutions). The convolution of these three realities gives contemporary bureaucracies the resilience upon which they thrive; therefore, any attempts to take down such bureaucracies usually focus on dislodging these three realities. In some cases and jurisdictions, though, attempts made even by elected government principals to subvert the bureaucracies within such established agencies and institutions have often met with rigid impediments that are rather formidable.

These structures, with the associated processes and procedures that hold contemporary bureaucracies together, are intended to be a means to an end – the end of organizing and optimizing the quality and utility of services rendered to the general public within government frameworks (Shapiro 2017). But when these bureaucratic procedures, structures, and processes are taken out of their intended frameworks and made to become an end in themselves, they can become dysfunctional and misappropriated to the detriment of public service. Their operationalization becomes warped, in what sources have described as "bureaupathology" or "bureaupathy," where goals become obscured and displaced in the course of excessive routinization and conformity (Grant 2014); and organizations are unable to foresee, adjust, and respond proactively to changes in environmental variables.

Existing research has argued about the importance of bureaucratic autonomy, within contemporary bureaucratic structures, as a facilitator of the bureaucratic influence of an organization, be it endogenous or exogenous. Contemporary bureaucratic autonomies are perceived in terms of the autonomy of will (being able to autonomously develop bureaucratic preferences) and autonomy of action (the capacity to transform such

preferences into action) (Bauer and Ege 2016). The proposition that bureaucratic autonomy is able to facilitate the bureaucratic influence of an organization indeed holds practical measures of truth, especially when considered in light of the realities trailing the bureaucratic framework that has seen the rise and bloom of the Chinese economy in recent times. The fact that government and her agencies can autonomously envisage preferences that they consider to be in the best interest of the larger political system and greater public utility, and are able to autonomously mobilize and pursue progressive action toward the attainment of such preferences for the satisfaction of the general public interests that they envisage, could indeed be an effective catalyst for progressive change and development. Another fitting example here is the discretionary bureaucratic autonomies wielded by international governmental organizations and agencies in fulfilling the mandates of their political principals.

Max Weber propounded one of the earliest bureaucratic models of leadership since the nineteenth century, and the propositions of the model – hierarchical organization, top-down administration, and formal channels of accountability – still relevantly apply (Weber 1947). But in addition, contemporary researches now reflect a wider acceptance of the reality that bureaucratic leaderships must be established with regard for the crucial elements of experience, capacity, vision, skill, passion, patience, commitment, knowledge, maturity and emotional stability, integrity, character, and devotion, because bureaucratic followership counts on visionary and innovative leaderships to inspire, direct, and motivate in the pursuit toward the attainment of bureaucratic mandates, goals, and objectives. Indeed, leadership within bureaucracies requires the right application of available material and immaterial resources in the pursuit of specific ends while in the process also ensuring coherence and cohesiveness of the bureaucratic organization (Amanchukwu et al. 2015). It is a little wonder that, within contemporary bureaucratic leaderships, it is believed that part of the duties of elected public officers is to hold bureaucrats directly responsible for whatever outcomes are delivered by their designated agencies and institutions and rightly so because, ultimately, the elected officers are primarily culpable and answerable to the electorate for whatever bureaucratic dysfunctions are perpetuated under their watch.

In contemporary societies, however, these bureaucratic structures, processes, and perspectives are increasingly being challenged; particularly with respect to the bureaucracies within the public sector. Through interest representation, adherence to due process, effective management, policy analysis, the character of federalism, and stakeholder oversight, the American society has gradually been able to reform the bureaucracies in their public service sectors. In addition, organizational bureaucracies within the public service are also being reformed to see that appointments and recruitments are more merit-based, insulated from elected government tenures, and free from dismissals that may be politically motivated, so as to engender innovation and boost entrepreneurial and investment confidence in the capabilities and subsistence of the public sectors (Gormley 2014). Furthermore, there have also been resounding clamors that demand a fairly structured public sector bureaucracy that is insulted from impulsive restructuring and reorganization at the whims and caprices of elected government officials, so as to help preserve their operational and procedural mandates and avail the measure of autonomy that is necessary to deliver high-quality public service that is free from the influence of the sentiments, volatile propagandas, political grievances, and dogmas of elected officials.

Also, research has attempted to redirect attention of elected public principals to consider situational variables as more crucial determinants of organizational outcomes, as against perceptions of the responsibility of bureaucratic individuals, because bureaucratic dysfunctionalities, as with other forms of dysfunctionalities, cannot be objectively analyzed and interpreted from the perspective of a single viewpoint, due to the complex co-action and interaction of endogenous variables in tension. With the growing availability of bureaucratic performance data, especially relating to various sectors of the government public

service, elected officials can now more than ever easily attribute the responsibility for causal realities surrounding bureaucratic dysfunctionalities to appointed bureaucratic leaders. However, through interest group advocacy and wider stakeholder dialogues, it may be possible to influence how such performance data are interpreted and used and the extent to which they reflect the competencies of bureaucratic leaderships (Nielsen and Moynihan 2017a, b).

## Social Consequences of Bureaucracy

The notion that the quality of government has an effect on long-term social outcomes is well established in contemporary existing research. Bureaucracy and its formal institutions have been proven to have lasting effects on the social behaviors and trust relationships between a government and its citizens, especially with regard to corrupt practices within the government structures. The delineation of hierarchies, roles, and responsibilities within bureaucratic polities also differentiates the nature and quality of social services that would be ordinarily available and accessible to various classes of the citizenry, perhaps due to the structural accumulation of cliques, political parties, and privileged groups. In addition, such structures could have counterproductive consequences when the hierarchy that is responsible for dealing and interfacing directly with the lower social classes reflects a corrupt, arrogant, and treacherous disposition, regardless of the possible positive impressions that the higher echelons of the polity may be laboring assiduously to propagate.

In contemporary bureaucratic structures within the government public service, citizens elect government officials, who in turn appoint their best choices to head various sectors of the public civil service. The traditional notion being that the duration and influence that comes with the office of service of these appointed public officers is inextricably bound to the tenures of the higher-level elected government officials that appointed them. As such, the idea of occupational security is expunged. These appointed public servants may, in no distant time, begin to engage in certain impulsive behaviors and practices that are morally and operationally detrimental to the sustainability of the general public service and utility. They may thus begin to position themselves as rent-seeking middlemen in the path of public service contractors, redirect and misappropriate public resources to assuage their occupational insecurities, and engage in propagating malicious propaganda that seem to align with their reelection and reappointment motivations. In the long run, they often end up scaring off investors, strangling entrepreneurship, stifling innovation, and fostering impunitive corruption and nepotism.

When these bureaucratic structures happen to be further decentralized, the resulting consequences could be even the more petrifying. The World Bank has referred to the kind of corruption that could emanate from such decentralized bureaucratic setups as “the greatest obstacles to economic and social development,” especially within the context of developing countries (World Bank 2001). The cavalierly passing around of bribes and handouts becomes a fashionable way to make government officials look the other way, while the sanctity and very essence of public utilities within democratic polities are being violated in the most atrocious manners. Thus, and in the long run, having flooded the local market economies and public sector with much corruption-induced uncertainty, the spiral effects of huge, increasingly disproportionate and a priori indeterminable bribe burdens result in a situation where government revenue figures become distorted, unrealistic, and false; investor ROI projections become misleading; socio-infrastructural development projects are stalled; and reliant institutions, agencies, and corporations are rendered ineffective by a distasteful concoction of these concomitant consequences.

Furthermore, in such public civil service bureaucracies, where elected officials appoint the upper administrative circles of the service to administer and oversee the affairs, personnel, and activities of the public civil service, if not carefully and closely monitored by active,

independent, and effective representative and whistle-blowing structures, the outcome could result in situations of misappropriation, marginalization, impunity, trampled individual agency and autonomy, nepotism, and silencing of dissent, even within respected, gold standard democracies. The summative consequence of these realities is often a situation whereby elected officials are unable to establish contingence with the complaints and needs of the lowers classes of citizenry due to the bureaucratic abstraction of social hierarchies, as well as the nature and quality of the public service and utilities that are available and accessible to the various social hierarchies.

However, when bureaucratic leaderships are effective and progressive, they are able to engender innovation, stimulate ingenuity, encourage autonomy of thought and freedom of expression, and breed satisfaction among the followership in bureaucratic praxis. Lower-level bureaucratic followers might then be able to leverage the atmosphere of responsible autonomy availed by effective and progressive leadership as a foundation for occupational growth and development.

In addition, bureaucratic autonomies should be understood to be a double-edged sword. In the right hands, combination of the "autonomy of will" and the "autonomy of action" could lead to remarkable change and impressive transformation, especially when vision, ethics, and law are blended smoothly to guide operations. However, in the wrong hands, bureaucratic autonomy could become a tool for popularizing bureaucratic vices such as administrative bullying, propagandist interference with the public media, victimization of dissent, occupational harassment, and dictatorship, thereby trampling the propositions of democracy and certain human rights, even with the impunitive autocracy of powers arrogated to self.

## Implications for Global Sustainability

Global sustainability goal numbers 10 and 16 seek to bridge the margins of income inequality both within and among nations and foster societies that are peaceful and inclusive by upholding systems of justice and building institutions that are accountable, effective, and inclusive at all levels. One panel for pursuing these goals is by reducing the cost of doing business and import-export trade while also reducing the burden of taxes and levies that non-indigent workers have to shoulder in appropriating their earned income across various jurisdictions of the global society. Another panel involves stemming the tides of violence, crime, trafficking in persons, forced labor, and child abuse and building more reliable judicial systems that uphold democracy and the rule of law for peace, justice, as well as the sanctity of citizen rights, including the right to quality social services.

Evidently, the social consequences of bureaucracy presented in the preceding section of this chapter do portend critical implications for the global Sustainable Development Agenda 2030. One facet of these implications is evident in the attempts by national governments to capitalize on bureaucratic structures to suffocate the independence and autonomy of the public news media, as has been witnessed in countries like Egypt in recent time, as well as the propagandist dogmas that have helped to propagate the festering menace of canards and fake news in the public media in recent times. The global sustainability goal 16 advocates for peaceful societies; however, with the consistent waning and progressive erosion of the measures of trust that global citizens repose in the credibility and completeness of reported media information, democracy is bound to lose its effectiveness, and its wheels become immobilized as electorates would continue mooching in darkness, blind to the realities of the vices being propagated by elected officials. Although history has proven time and again that this is a simmering concoction for civil unrest, revolutions, and disruption of public peace; which is guaranteed to boil over sooner than later.

In addition, the clamors of the electorate for justice, infrastructural development, income equality, accountable leadership, good and responsive governance, and the responsible use of

public resources are likely to persist and linger unattended, especially within bureaucratic structures where varying qualities of public service are available and accessible to various cadres of the public citizenry. The appointed bureaucratic leadership of a public service who has access to high-quality medical care, even overseas, would not be able to contingently fathom the extent of dilapidation in national healthcare service delivery, just as the elected official who travels in an official chopper would be unable to understand the clamors for good road transport infrastructure by the citizenry. This reality is capable of frustrating efforts at bridging the gaps of inequality and restoring the vital trust between people and the government for global sustainable development.

Furthermore, corruption, extortion, and exploitation thrive more easily under the cloaks of public service bureaucracy. It is easier for public sector officers to hike the costs of public services so as to rake in some kickback profits for themselves at the expense of the public; and because channels for reporting such incidences are also clogged by the same bureaucratic plugs, it is difficult to hold these public officers accountable. Many researches have argued that spates of bribery and corruption that strangles developing economies and have weakened the underdeveloped economies of Africa and Asia thrive on this reality, and this research lends credence to that argument. Public officers who receive government remuneration from taxpayers' money would begin to demand and enforce the additional payment of gratuities from the citizens they serve for doing their jobs, confident in the fact that is very unlikely that they would be held accountable; no thanks to the bureaucratic bottlenecks that make very onerous the task and process of holding them to account. Preponderant open media reports document this reality as having pervaded the police, military, banking, civil service, state departments/ministries, and every other area of public service in various jurisdictions.

When the convolution of all these implications eventually succeed in bleeding to death the voice of democracy and permanently severing the bonds of trust between citizens and their government, which are essential for fostering inclusive, peace, and cohesive global societies, perhaps, then it may be said that our global society has begun to self-destruct, having been progressively amputated by the knives of her own bureaucracies.

## Summary and Conclusion

Indeed, bureaucracies, when carefully established and closely monitored with open, trusted, and reliable systems of accountability, representation, and whistle-blowing, could be a catalytic force for sustainable development across various frontiers. However, where cavalierly dispositions are left to maraud and fester unbridled under the shelters of bureaucratic structures and frameworks, the impact and implications for global sustainable development are far-reaching and daunting.

By beginning to restructure the bureaucracies within the government public service sectors, bearing in mind the realities presented and discussed in this chapter, it would then become more possible for the wings of the global sustainability Agenda 2030 to spread out and soar unhindered into the future that has been envisaged.

# Sustainable Energy Policy for State and Local Governments

Haris Alibašić
Public Administration Program, College of Education and Professional Studies
University of West Florida,
Pensacola, FL, USA

## Synonyms

Energy efficiency; Renewable energy; Sustainability; Sustainable energy

## Definition

Sustainable energy is defined as sufficient measure for energy management undertaken by organizations to reduce energy usage, increase the use of renewable energy sources in operations to reduce operational costs, decrease environmental impact from energy use, and impact society positively.

## Introduction: Sustainable Energy for Local and State Governments

The role of government is characterized by the ability to provide services to its constituents. As the societal paradigms shift, and sustainability gains new grounds and becomes an integral part of the organizational structure and function of the local and state governments, the issue of sustainable energy management as the system of good governance and cost control became more prevalent. State and local governments use sustainable energy policies in pursuit of long-term sustainability goals and to enhance resilience and long-term strategies. Energy use and its collateral damage have come to the forefront of some local government as part of their efforts to improve their sustainability efforts. As the pressures intensify on organizations over the cost of energy consumption, climate change threats, and financial

burden, sustainable energy management within the sustainability framework offers a focal point and opportunity for municipal and state government administrators. The effort to seek sustainable energy options in governmental operations is seen as an attempt to curb the cost of energy and to reduce energy demand.

Focusing on sustainable energy policies, programs, and projects at the local and state levels of government represents an inevitable challenge, but also a conceivable opportunity. The long-lasting impact on local and state governments and their delivery of services beyond the economic recession and downturn in the economy. In an era of unrelenting fiscal crises and permanent budgetary strains, cities and state government continue to struggle to provide essential services. As a result, cities and state government have begun utilizing sustainable energy practices, policies, programs, and projects as an organizational instrument to avoid costs, lessen budgetary strains, and realize full benefits of being fiscally, environmentally, and socially sustainable.

The efficiency of the local government's operations can have a positive impact on the local community. By incorporating sustainable energy management and similar strategies into their plans, programs, and projects, cities may become more fiscally sustainable, and socially and environmentally responsible, and provide better governance. Through sustainable energy policies, organizations efficiently impact their bottom line and provide positive social change through reduction in energy consumption, production of renewable energy, and efficient management of energy. In explaining the concept of sustainability, Nersesian (2006) focused on renewable energy sources as an essential aspect of sustainability (p. 305). Moreover, Meyar-Naimi and Vaez-Zadeh (2012) and Chen (2011) provided the critical reviews of the new energy policymaking frameworks and analytical framework for energy policy evaluation, through analysis of the energy system components and their interactions. The relevant objectives of sustainable energy policies must be viewed through the lens of the federal energy policy framework, with the United States lacking the national energy policy (Friedman and Cooke 2011; Geri and McNabb 2011).

## Local Governments Sustainable Energy Targets

Energy is the underlying denominator for many cities. While cities utilize varying energy strategies not only to cut costs but also as an attempt to increase the renewable energy in their overall energy consumption portfolio, there are several common elements to cities' sustainable energy strategies. Building awareness, support, and education of the importance of energy to the organization and community is one of the first steps in the successful implementation of sustainable energy policies. Another important aspect is the razor-sharp focus on energy efficiency and energy conservation. An increased renewable energy investment or pursuit of renewables is the more recent development of local governments. The EPA provides a regular update on the top 30 local governments either purchasing or producing electricity (EPA 2017). The list is growing as is the amount of renewable energy produced and purchased by local governments. At the 2017 US Conference of Mayors annual meeting, the US mayors passed the resolution to target 100% renewable energy by 2035, and subsequently, over 250 cities passed resolutions supporting the 100% renewable energy targets (USCM 2017).

Conventionally, municipalities are most concerned with their annual budgeting and less with influencing and impacting the energy consumption or policy related to energy management. Among many other researchers, Brownsword et al. (2004), Cumo et al. (2012), Droege (2006), Houck and Rickerson (2009), Hughes (2009), Keirstead et al. (2012), Kim et al. (2006), Lin and Huang (2009), Lior (2010) Mathiesen et al. (2010) all demonstrated the impact, opportunities, and challenges sustainable energy at local government level and the society in general. Moreover, Johnston et al. (2013) provided examples of energy conservation, renewable energy, building and land planning, transportation, and other sustainability

initiatives to promote fiscal and environmental soundness in Chicago, Ann Arbor, Vancouver, Houston, and other cities around North America. Local governments may use sustainable energy to assist them in reduction and avoidance of costs. Many communities use sustainable energy as an opportunity for savings, and ultimately for a more sustainable organization.

## States Renewable Energy Portfolio and Targets

Since Carley's (2009) review of the states' renewable energy policies effective, most states have been increasing their efforts to support renewable energy production and consumption. Most aggressive states utilize Renewable Portfolio Standards (RPS), which demands utilities to incorporate a certain percentage of renewable energy sold in their portfolio. While RPS varies from state to state, Durkay (2017) lists 29 states and the District of Columbia with the mandatory Renewable Portfolio Standards (RPS). The states of Hawaii and California have the most aggressive RPS, both with the 100% renewable energy target by 2045 with Hawaii setting up a target in 2015 and California in 2017. Vermont is another state with an RPS of 75% by 2032. Each state with the RPS has an incremental goal and specific percentages required to be met by utilities in the meantime.

**Additionally**, eight states have a voluntary renewable energy target. Finally, in addition to RPS, most of the state legislation include energy efficiency and energy consumption reduction goals as part of the requirements and in part to assist in achieving renewable energy targets. Reducing energy consumption enables a more natural attainment of the renewable energy target. While most policies behind RPS in states are due to increased constituents' demands for clean energy, and the economic development benefits from renewables, there are other motivating factors for adopting stricter mandates statewide for renewables. For instance, Yi and Feiock (2012) found the positive correlation between the supply-side policies and the demand-side policy innovation driving the adoption of the RPS at state levels of government.

## Measuring the Sustainable Energy Impact

The critical focus of sustainable energy policies at local government levels is reducing the negative impact of environmental damage from consumption of energy produced by fossil fuels. In addition to well-documented benefits of sustainable energy in local governments' operations and communities, cities require lowering annual Greenhouse Gas Emissions and meeting ecological and social goals (Burch 2010; Byrne et al. 2006; Lin and Huang 2009; MacKay 2009).

While social benefits are not immediately evident from the sustainable energy management, they may be inferred in the quality of life benefits. Energy is a significant cost driver for the entire organization, and by efficiently addressing energy cost, the city assures savings and reduces costs of operations, opening for reinvestment into the community. Ultimately, leading sustainable energy management practices can be applied it in the community, building successful programs and partnerships with other organizations using energy audits in homes and energy efficiency improvements.

The issue of using finite sources to power the energy needs of our society is as pertinent in the modern world as the impact of globalization, and increased competition for fossil fuels and other resources threatens the social and environmental balance of the world as a whole. The holistic system of interconnected elements of economics, sustainability, and energy-related resources represents a prospect to positively impact cities in a broader context of positive social change. It is imperative for organizations to be financially sustainable. However, it is also essential that they measure and report the overall environmental, governance, and social impacts beyond their economic gains (Alibašić 2017). The measurement of sustainable energy efforts is particularly imperative for the local and state governments, as they provide an immediate impact for their

constituents through service provision. As cities and communities across the globe attempt to implement sustainability program, policies, and projects, the future generations of policymakers need to be proficient in sustainability-related issues from the outset regardless of their desired career paths. Local governments involved in sustainability are committed to protecting environmental and social resources when seeking delivery of services most efficiently and efficiently. By actively pursuing sustainable energy options, including investments in the reduction of energy consumption, renewable energy production, and energy management, organizations attempt to impact their economic bottom line positively, and influence potential positive social and environmental outcomes, thus affecting positive social change.

## Conclusion

Local and state governments seek renewables, energy efficiency, and sustainable energy management to address budgetary constraints, constituents' demands, sustainability targets, and ongoing changes in energy markets. Cities and state governments use sustainable energy as a dynamic approach to long-term planning and countering negative economic, environmental, and social aspects of energy production and consumption. Sustainable energy policies and corresponding planning and policy implementation hold a promise of cleaner, more robust economic development driven energy production, with less cost and more benefits. Positive outcomes related to the successful deployment of sustainable energy platforms in cities have a ripple effect on communities and states, and vice versa.

# Sustainable Innovations in Ugandan Financial Institutions

Aziz Wakibi, Joseph Ntayi, Muhammad Ngoma, Isaac Nkote and Sulait Tumwine
Makerere University Business School, Kampala, Uganda

## Synonyms

Sustainable advances; Sustainable improvements; Sustainable inventions; Sustainable novelties

## Definition of Terms

Sustainable innovations: "the development of new products, processes, services and technologies that contribute to the development and well-being of human needs and institutions while respecting natural resources and regeneration capacities" (Tello and Yoon 2008, p. 165).

Organizational resilience: Organizational resilience has been defined as "the maintenance of positive adjustment under challenging conditions such that the organization emerges from those conditions strengthened and more resourceful" (Vogus and Sutcliffe 2007).

Self-organization: According to Kauffman (1993), self-organization is the spontaneous reallocation of energy and action and the creation of a coherent pattern and order out of local interaction through which autonomous and self-reinforcing organizational systems achieve a collective goal in a changing environment.

Institutional logics: Thornton et al. (2015, p. 2) define institutional logic as the socially constructed, historical patterns of cultural symbols and material practices, including assumptions, values, and beliefs, by which individuals and organizations provide meaning to their daily activity, organize time and space, and reproduce their lives and experiences. **OR**

Cultural beliefs and socially shared rules that shape the cognition and behavior of actors, providing meanings for socially shared symbols and practices by providing legitimation criteria (Friedland and Alford 1991; Thornton et al. 2012).

Networks: Networks are treated as structures through which information and knowledge can be (unproblematically) transferred from suppliers to users so that the new "thing" can be adopted within the user firm. **OR**, Networks are referred to as dyadic relations and interdependence among actors (Gretzel 2001; Wasserman and Faust 2012).

## Background to the Study

The advent of the coronavirus disease pandemic in 2019 (COVID-19) never experienced before in our lifetimes has affected financial institutions especially commercial banks calling for rethinking, rebooting, and renewal of their internal processes to regain their consumers who have

changed the way they manage their finances (Shen et al. 2020a). The introduction of social distancing restrictions coupled with full or partial closures of government and private sector businesses to curb the spread of the corona virus disrupted significantly the way consumers manage their finances requiring commercial banks to change their innovation norms to suit the current uncharted business waters. The COVID-19 period characterized with widespread branch closures and shortened opening hours saw a number of reinventions among commercial banks. Although Uganda is slowly relaxing its COVID-19 confinement measures, mass gatherings are still not permitted and strict observance of hygiene practices like handwashing, wearing face masks, and the use of sanitizers remain in place. The increased quest to cope with the new normal requires financial institutions mostly commercial banks to comply with the Ministry of Health and World Health Organization Standard Operating Procedures for COVID-19 as demonstrated by Stanbic Bank Uganda Limited.

Stanbic Bank Uganda Limited (SBU), a subsidiary of Standard Bank of South Africa, started its operation in Uganda in 2002. This was after acquiring 90% of shareholding in Uganda Commercial Bank. It is among the 25 commercial banks licensed by Bank of Uganda under Tier 1. The bank has over 551,703 customers with 78 branches and 174 automated teller machines countrywide. The year 2019 closed with the emergence of COVID-19 pandemic which banks had not prepare for. The operations at the branches were interrupted by the implementation of COVID-19 pandemic standard operating procedures, which resulted into closure of most businesses. SBU witnessed low walk-in clients, less deposit, and withdrawal transactions, no more new account opening, low loan repayment, and less disbursed loans. This meant high cost of doing business in the financial services industry. However, due to the increased need for banking services under lockdown, SBU managed to rethink, renew its internal operations to continue providing services to its customers. The bank temporarily closed some branches and reorganized to ensure a rationalized operating capacity.

As an adaptive mechanism to cope with the scourge of COVID-19 pandemic, Stanbic Bank Uganda Limited redesigned the branches, put up new structures and processes like lining up while observing 4 meters social distance. Reducing the numbers of working staff and operating hours thus came up with new novelties of serving customers like online platform such as Stanbic App for online account opening (launched the Kwata-Kwata online account opening campaign) and other transactional services like contactless visa cards for payment at point-of-sale machines. Other innovations included forex trading, business online, enterprise online, flexipay, cash deposit machines, and hastened use of mobile banking, Internet banking, agent banking, and ATMs. The bank also upgraded its Microsoft systems, set up enterprise data office and learning platform, and invested in data capabilities through provision of Wi-Fi and modems to its staff to enable online banking and sessions.

The bank had to rethink and balance its stakeholder, professional, commercial, and social norms of doing business. It adopted measures that improve the well-being of the employees, clients, and external stakeholders. It put in place measures to ensure health and safety of its stakeholders, adhered to the necessary social distancing measures, supported government with protective gears for frontline workers, encouraged clients to wear face masks and ensure proper disposal of used ones, and networked with Ministry of Health to promote the "Tonsemberera" – Keep Your Distance campaign. The bank has also focused on developing sustainable programs that have a positive impact on communities through its corporate social investment (CSI) programs. Stanbic doubled its investment in corporate social responsibility to enhance all efforts to support vulnerable communities during the pandemic.

SBU offered credit relief programs such as loan holiday packages for its customers to redress the economic impact caused by COVID-19 and ensure that customer's businesses are sustained and the impact on the economy is minimized. The bank reduced on its prime lending rate to 16% on top of waiving loan facility fees and ensuring a guaranteed response time of 3 days

once clients apply for facilities. In partnership with UN, SBU established an Economic Enterprise Restart Fund (EERF) to restart the economy and drive growth by providing a syndicated fund to small and microenterprises and SACCOs, VSLAs, and non-deposit-taking MFIs to survive, recover, and thrive during and post-COVID-19 impact. Stanbic created a number of networks to survive the troubled business environment. In partnership with UNDP, Stanbic launched a Youth-4-Business Innovation and Entrepreneurial Facility intended to spur impact-driven entrepreneurship, foster innovation, and leverage business solutions to address the youth unemployment challenge, and enable micro, small, and medium enterprises (MSMEs) recover from the impacts of COVID-19. SBU partnered with Wamawo, a logistical agent in China. Stanbic clients now send specifications to Wamawo to source for them and facilitate everything and products are received in Uganda. They launched the trade-sure insurance to provide cover for goods in transit. It networked with mobile operators to protect customers from fraud on mobile banking platform.

The bank is protecting the environment and value environmental quality more than their institution comfort. SBU is promoting green energy to do away with deforestation. It has partnered with companies such as M-Kopa, to provide solar at a microlevel to light up schools and households, and Uganda Breweries Limited (UBL) in a new awareness campaign against deforestation by encouraging public to plant trees to stimulate sustainable development and save the environment. SBU signed an MOU with Kampala Capital City Authority (KCCA) to promote responsible use and recycling of plastic waste for sustainable environmental protection in Kampala. The bank is undertaking environmental research to better analyze credit risk. This has helped the bank with better ways to understand environmental and social impacts and incorporate these into their investment decisions. It started participating in green electricity programs, signed up for a carbon offsetting program, implemented electricity saving activities, and adapting the use of energy-efficient technologies such as light bulbs to reduce on energy consumption. They introduced paperless deposits.

Through its communication mix, SBU reached to its borrowers to understand their challenges, how COVID-19 has impacted their businesses, and to help advise them on how to revamp their businesses. This helped them to maintain relationship with existing stakeholders. Most businesses have picked up and are running again. SBU has worked under BOU which has provided a much-needed regulatory refresh to support innovations during this pandemic. The bank has also adhered to codes of best practices. The bank formed collaborations and alliances with actors involved in the community like KCCA, UBL, UN, and other government agencies to stress the relevance of measuring and monitoring sustainable development issues.

The bank has attained reasonable results from its interventions. The bank has increased its loan portfolio as a result of reduced interest rates by 5%. The number of customers has increased to over 552,000. A total of 1,059 new accounts were opened through the online platform. A great number of clients are now transacting via online. SBU investments increased by 15% to UShs 2.9bn from UShs 2.5bn in 2018, with over 374,169 beneficiaries. Loans disbursed in 2019 increased by 23% to UShs 2.1tn providing financial intermediation to various sectors. Further digitization: A 28% drop in paper consumption year on year. Energy efficiency: 5% drop in energy utilization and 9% drop in fuel consumption. Paper consumption dropped by 28%, following the recycling initiatives on archival boxes and implementation of paperless deposits, backed by continued momentum on digital and alternate channels (Stanbic bank annual report, 2019 page: 58–121). The bank offered credit relief to over 1,600 clients across business sectors. The bank has over 40,000 SME clients, and over 60% of its loan portfolio was restructured to provide financial relief to small and medium enterprises (SMEs).

The activities adopted by SBU have put back banking into the hands of clients wherever and whenever they are during the outbreak of COVID-19 pandemic. With over 2,700 active agents

across the country, it has demystified brick and mortar banking to create a win-win situation for the bank and its clients. This has resulted into cost-effectiveness of clients' touch points. SBU has been in position to attract new and maintain ongoing clients due to interventions. As a result of Internet and business online banking, over 85% of all the bank's transactions are now executed digitally. That is, there is a gradual increase of transaction activities through its innovative digital channels.

The success of Stanbic bank's activities during the outbreak of COVID-19 was accomplished when management of SBU evoked its major core values (institutional logics). This informed its interventions and predestined that the bank has to self-organize, develop adaptive and robust mechanisms, and interact and share information with other institutions through networking. As a result, SBU created a system which enabled them bounce back, absorb disturbance, and undergo change. SBU was able to survive, adapt, and transform through its innovations which are sustainable in the face of change and uncertainty. This is in agreement with Nkundabanyanga et al. (2020) who observed that for Uganda's financial institutions to survive, they must be highly innovative and resilient. Additionally, the bank has also uphold its entire business model (logics) which is based on trust, integrity, proactivity, working in teams, and servicing customer. They have done everything in their powers to ensure that customers are provided with products, services, and solutions to suit their needs. Therefore, the content of this reality can be elucidated by theory of institutional logics (Thornton and Ocasio 1999) and complexity theory (Goldstein et al. 2010).

The theory of institutional logics advanced by Thornton and Ocasio (1999) is based on the premise of understanding individual and organizational behavior by investigating in a social and institutional context, which ought to regulate behavior as well as providing opportunities for intervention and change. During the COVID-19 outbreak, sustainable innovations were attained through reevaluating the market, professional and stakeholder logics, and institution's core values but not limited to its norms, regulating roles, and practices. When SBU reduced its working hours and waved off transactional fees on digital services, it was implementing its internal and BOU's guidelines. These regulations and norms are deliberative construct of institutional logics. Thornton and Ocasio contend that institutional logics through market, professional, and stakeholder functioning in combination can withstand collaboration and enforce sustainable innovations in a recurrent game context. Therefore, this theory if adopted may affect positive actions of financial institutions in attaining sustainable innovations. However, this theory does not explain how the bank absorbed and bounced back from adversities, does not address adaptation, self-organization, and key features of networks such as ties, interaction, and interdependence which control the amount of information flow (Katz et al. 2005). Hence, this insufficiency could be addressed by complexity theory.

The complexity theory advanced by Goldstein et al. (2010) represents a framework for pre-existing order and structure in the system and within its ecology, such as constraints on the system and capabilities within the organization which are critical for the emergence of a new order. These new patterns and structures are capable of forming transformation and adapt to adversities through networking. Depicting from the reality in the story, SBU has been able to network, self-organize, and subsequently adapt by delivering on new several innovations for clients. These initiatives such as online account opening, mobile banking and lending, enhanced agent banking, and Stanbic App among others helped the bank to bounce bank and pushed the services in the hands of clients in such a multifaceted environment. These financial institutions are complex organizations with systems and processes that self-organize, adapt, and network in order to meet changing needs of the clients. If this theory is adopted it will form a comprehensive model to enhance sustainable innovation in the banks. This theory, however, is limited in explaining how agents and players with divergent commands can facilitate sustainable innovations in financial

institutions. This deficiency can be addressed by institutional logics theory. This study therefore advocates for the merger of the above two theories in explaining the phenomena.

Financial institutions worldwide are expanding their business continuity and sustainability teams in order to remain competitive and survive amid the COVID-19 outbreak, thereby creating a new normal for the post-corona period. There is growing evidence supporting the introduction and implementation of innovations (process, technology extra) in commercial banks in order to meet the needs of their financial consumers. However, the survival of firms in the post-COVID-19 era will require a fundamental shift from the traditional bank innovations approaches to sustainable innovations models (Wilson and Tyfield 2018). Moreover, research on sustainable innovations is still in its infancy and places excessive emphasis on corporate social responsibility rather than on the sustainability of business operations (Shen et al. 2020b). Extant literature has tended to focus its attention on process innovation (Tsinopoulos et al. 2018; Un and Asakawa 2015), product innovation (De Massis et al. 2015; Marzi et al. 2017), structural innovation (Geels 2004), technology innovation (Aruna and Santhi 2015), and social innovation (van Wijk et al. 2019; Alexander et al. 2020; Cuntz et al. 2020) with little emphasis on sustainable innovations especially in financial institutions. Most of these studies are steered from different theoretical perspectives of the resource-based view of the firm (Kang and Na 2020), resource dependence theory (Davis and Cobb 2010), stakeholder theory (Munodawafa and Satirenjit 2019), institutional theory (Pekkanen 2021), and agency theory (Cardoni et al. 2020). However, these theories offer only limited explanation of sustainable innovations. Additionally, those studies that have endeavored to include the element of sustainability have comprehensively focused on the economic and social components disregarding environmental perspectives (Seuring and Muller 2008). These scholars have studied innovations during stable periods not affected by any pandemic, thereby largely snubbing complexity theory. This results into undertheorization of sustainable innovations. Yet to achieve sustainability outcome through innovation activities, financial institutions need to broadly consider environmental aspect. Sustainable innovations is no longer a choice but a necessity, and it must be incorporated into the DNA of every activity and business especially in financial institutions. This paper adopts a multitheoretical approach combing complexity and institutional logics theories to explain sustainable innovations among financial institutions.

## Sustainable Innovations: Conceptualization and Antecedents

The sustainable innovations exhibited by Stanbic bank during COVID-19 pandemic can be explained by institutional logics of intuitional logics theory (Thornton et al. 2012), and constructs of self-organization, networks, and organizational resilience which are derived from complexity theory. Figure 1 reveals the relationship which exists between institutional logics, self-organization, networks, organizational resilience, and sustainable innovations.

As can be seen in Fig. 1, the conceptualization of sustainable innovations and the constructs predictability are guided by the complexity theory and the theory of institutional logics. The complexity theory and the theory of institutional logics offer metaphors which are used to build the conceptual model. Complexity theory provides an integrative and dynamic framework to understand the interaction patterns in networks of interdependent agents who interact and are bound by their common needs or objectives. It is therefore suggestive that through these vigorous interactions and adaptive orientation of systems new things, occurrences, and behaviors tend to emerge. We see new patterns developed and old ones changed as is the case of Stanbic bank. Complexity theory lies at the heart of what innovation scholars are interested to study: the dynamics and emergence of new order. Complexity theory seeks to investigate the properties and behavior of the dynamics of nonlinear systems and provides an opportunity to reexamine reductionist and mechanistic thinking, thereby

**Sustainable Innovations in Ugandan Financial Institutions, Fig. 1** Antecedents and dimensions of sustainable innovations

providing a more holistic view (Aritua et al. 2009). This theory demonstrates a link between complexity and sustainable innovations among financial institutions. This is supported by empirical work of Castells (2000), who found that emergence of the Internet and of the "network society" has been accompanied by the development of the "science of networks" (Watts 2003; Newman et al. 2005). However, the theory disregards the concerns connected with institutional logics to achieve sustainable innovations. This imperfection is addressed by the theory of institutional logics.

Institutional logics improve the space of sustainable innovations through the establishment of market and professional stakeholder that shape the behavior of actors through existing laws and regulations. Therefore, the theory of institutional logics has been incorporated in the model to predict sustainable innovations. Empirical evidence shows that sustainable innovations can occur in existing institutions, as they adapt to address new opportunities, changed environments, or new cultural sensibilities (Glynn and Raffaelli 2015).

Institutional logics is one of the ways through which FIs can self-organize and form networks. These networks that include ties, interactions, and interdependence boost great flow of information within strong and weak ties of agents (Katz et al. 2005). These networks eliminate bottlenecks and influence connections among key employees (Cross et al. 2007) who contribute to organizational functioning by supporting greater organizational communication and access to resources (Forret and Dougherty 2004). As a result, an organization can transform itself into a resilient organization by the best allocation of available resources to continuity and recovery plans (Ates and Bititci 2011; Boin and van Eeten 2013; Llorens et al. 2013). Building resilience in the workforce is key to adapting to the challenges ahead and banks are able to move mountains (Richardson and Ingoglia 2020) to cope, bounce back, and adjust in the face of this unprecedented

adversity (COVID-19). Consequently, this gives the FIs a superior hand in influencing sustainable innovations through creation of a resilient organization. This suggests that institutional logics role in influencing sustainable innovations is mediated by self-organization, networks, and organizational resilience. Table 1 provides a summary of the two theories reviewed for this paper.

**Sustainable Innovations in Ugandan Financial Institutions, Table 1** Summary of reviewed theories

| Theories | Theory summery/Focus | Weaknesses | Variables |
|---|---|---|---|
| **Complexity theory** Goldstein et al. (2010) | Provides an integrative and dynamic framework to understand the interaction patterns in networks of interdependent agents who interact and are bound by their common needs or objectives<br>The theory focuses on open dynamical systems that are able to self-organize their structural configuration through the exchange of information, energy, and other resources within their environment, and are able to transform these resources in order to support action<br>The theory focuses on systems that are adaptive, absorptive, and evolve while they self-organize<br>The theory explains agents whose interactions result in self-organization, emergence, and adaptation<br>The theory elucidates the world as being a complex system, with complex interactions and large networks of components with no central control and leadership<br>Studies the behavior of complexity interacting, interdependent, and adaptive agents under internal and external pressures. | There is a lack of integrated accounts of what complexity actually means in terms of sustainable innovation, and how complexity theory could be plausibly applied to studying innovation<br>Criticized for its overtly "creative" and metaphoric use of concepts derived from the natural sciences and for the inapplicability of its theories to the social context. In addition, scholars have demanded a stronger link between theory building, mathematical and computational modeling, and empirical evidence<br>The lack of novelty. Critics have argued that complexity theory represents little more than an elaboration of theopen systems paradigm<br>Lack of theoretical and methodological coherence. The use of complexity theory concepts and methods in organizational studies has led to unique epistemological features, lack of theoretical coherence, and, accordingly, to a number of misconceptions<br>It ignores the linear approximations and it is difficult to foresee emergent behaviors from the characteristics and relationships of the systems. | Self-organization<br>Networks<br>Organizational resilience |
| Institutional logics theory (Thornton and Ocasio 1999). | Contributes to institutional theory through its capacity to explain institutional change and agency. This is conditioned by the definition of institutional logics as different "sets of symbolic meaning and practices" which coexist and create friction in actors' perceptions of social reality. Because individual actors cannot readily reconcile the different logics, they must creatively find solutions to this friction<br>Institutional logics are deeply embedded in organizational members' cognition and preferences, and they influence how members of organizations interpret and act in their relationships with others<br>Institutional logics influence human attitudes and engage human behavior | Institutional logics tends to treat "all organizations as though they are the same" and therefore "ignore[s] the obvious heterogeneity of organizations." Instead, we need to theorize, say the authors, about the *differences* across organizations<br>The theory also ignores the existence of opportunistic behavior in the market place | Institutional logics |

## Discussion

This review adopts a multitheoretical approach to explain sustainable innovations and the section below discusses the variables of the conceptual model. It stipulates the relationships between variables in a theoretical approach and highlights existing empirical evidences related to these variables.

### Conceptualization of Sustainable Innovations

The concept of sustainable innovations is described as the development of new products, processes, services, and technologies that contribute to the development and well-being of human needs and institutions while respecting natural resources and regeneration capacities (Tello and Yoon 2008). According to Bos-Brouwers (2010), sustainable innovations is innovations in which the renewal or improvement of products, services, technological, or organizational processes not only delivers an improved economic performance, but also an enhanced environmental and social performance, both in the short and long term have the capacity to generate positive social and environmental impacts. Szekely and Strebel (2013) also described sustainable innovations as the creation of something new that improves performance in the three dimensions of sustainable development: social, environmental, and economic. Such improvements are not limited to technological changes, and may relate to changes in processes, operational practices, business models, thinking, and business systems. In addition, Adams et al. (2016) state that sustainability-oriented innovation relates to changing philosophy and organizational values, as well as products, processes, or practices, in order to attain the specific purpose of creating and realizing social and environmental value, beyond economic returns. Thus, sustainable innovations is company's strategic and systematic attitude regarding economic, social, and environmental aspects, and not only to isolated actions, such as the development of new environmentally responsible processes and products.

### Institutional Logics and Sustainable Innovations

Institutional logics (ILs) is considered as a socially constructed perspective (Thornton and Ocasio 1999). They postulate that ILs are both material and symbolic, provide the formal and informal rules of actions, interactions, and interpretation that guide and constrain decision-makers. In the recent works, major societal institutions (for example, family) often present conflicting logics (Thornton and Ocasio 1999). Hence, it is argued that sustainable innovations could be practiced in competition and during unprecedented situations with other logics (such as., commercial, growth) (Zhu et al. 2016; Ren et al. 2017). IL represents the beliefs, culture, and regulations that guide how individuals and organizations think and behave, (Durand and Thornton 2018) and the assumptions and values that undergird their social interactions. It can form a fixed cognitive framework and be a standard for measuring legitimacy (Thornton et al. 2012). Indeed, Jarzabkowki et al. (2016) argue that when building theoretical contributions, we add to the sustainable innovations literature by presenting an approach that foster sustainable actions and stimulates a transition to sustainability. We therefore conclude that *institutional logics affect sustainable innovations.*

### Self-Organization and Sustainable Innovations

In the complexity theory, self-organization refers to the phenomena or patterns that explain how sustainable innovation components interact without central control (Anderson 1999). Sustainable innovation consists of independent components whose interactions are governed by a system of recursively applied rules that naturally generate stable structures. They self-organize as the natural result of nonlinear interactions. As a consequence, self-organization is based on the firm's adaptability and its reaction to the transformation of sustainable innovation components, a natural result of nonlinearity but one that generates a new order and configuration of the sustainable innovation structure (McCarthy et al. 2016). Anecdotal evidence reveals that bank employees are now

increasingly engaged in informal and loosely structured arrangements that advance new ideas in the commercial banking industry. The non-linear interactions between various elements of the bank stakeholders have created new structures. These loosely structured arrangements have created interactive dynamics between bank employees and the commercial banking environment during different phases of the self-organization. Self-organization arose to address market deficits in meeting bank customers' changing needs or concerns that arose during COVID-19 pandemic. The coevolving relationships between the different bank stakeholders involved developing innovative products and technology collaboratively. *We can therefore conclude self-organization and sustainable innovations are related.*

### Networks and Sustainable Innovations

The concept of networks through the dimensions of ties, interaction, and interdependence promotes information flow about sustainable innovations on economic, social, and environmental aspects. In this way, networks allow firms to innovate more quickly and develop new useful knowledge that is beyond their individual competences. They need external knowledge, i.e., knowledge that is beyond their hierarchical control, in the innovation process (Ferreira et al. 2013). Relatedly, Bongomin et al. (2018) revealed that the dimensions of ties and interaction significantly explain financial inclusion but interdependence as a dimension of social network was not a significant predictor of financial inclusion of the poor in rural Uganda. In the same way, Karlsson et al. (2015) found that members of a network may develop joint knowledge and product-specific language over time which helps to reinforce these relationships. These linkages therefore provide a structure to the organization of these firms. The dynamics of these network links therefore have an important impact on the innovation processes. Moreover, Nunes and Lopes (2012) showed that firms need external knowledge to develop their innovation activities and establish cooperation with other organizations to obtain that extra knowledge. In addition, Nunes et al. (2017) suggested that when interactions are considered and firms increase the level of interaction, they obtain better innovation results implying that as firms increase the intensity of interaction, they can introduce all types of innovation (product, process, and organizational). We therefore conclude that *networks relate to sustainable innovations.*

### Organizational Resilience and Sustainable Innovations

The concept of organizational resilience is referred to as the organization's ability to effectively absorb, develop situation-specific responses to, and engage in transformative activities that capitalize on disruptive surprises that can potentially threaten organizational survival (McManus 2008; Lengnick-Hall et al. 2011; Duchek et al. 2019). For instance, Lengnick-Hall et al. (2011) argue that organizational resilience results from organizational capabilities, routines, practices, and processes. In this regard, organizational resilience is the capability of the organization to foresee and resist events by adapting to them and naturally recovering (Jaja and Amah 2014). Building organizational resilience is a strategic initiative that changes the way an organization operates (Sheffi and Rice Jr 2005). Recent research agrees that organizational resilience is a complex, multifaceted, and multidimensional construct; however, the utilized notions and definitions of resilience vary greatly depending on the particular research context. According to Lee et al. (2013), Prayag et al. (2019), and Fang et al. (2020), two dimensions are used to measure organizational resilience: planned resilience which involves the use of existing, predetermined planning and capabilities, as exemplified in business continuity and risk management planning; and adaptive resilience which involves organizations developing new capabilities through dynamically responding to emergent situations that are outside of their plans. Moreover, Barasa et al. (2018) establish that resilience is a system's ability to continue to meet its objectives in the face of challenges and that resilience is both a function of planning and preparing for future crisis (planned resilience), and adapting to chronic stresses and acute shocks (adaptive resilience).

Other scholars like Kantur and İşeri-Say (2012) study resilience improvement using three dimensions, namely robustness, integrity, and agility.

The concept of organizational resilience comes from the complexity theory which is concerned with the way in which systems are created in interaction of agents that follow collective rules of behavior (Holland 1995; Kauffman 1993; Mitchell 2009) and that it provides the analytic tools and concepts with which to study these dynamics. Complexity theory originates from the natural sciences, but there is now an increasing trend to study social organizations such as financial institutions as complex adaptive systems. From the complexity standpoint, Carlisle and Mcmillan (2006) describe organizations as dynamical systems. They are complex adaptive systems comprised of agents (people) who experiment, explore, self-organize, learn, and adapt to changes in their environments. Complex systems are thus open and adaptive systems consisting of agents, interactions, and an environment. Further, Duchek (2020) suggests that resilience is a fundamental organizational ability that is directed toward organizational advancement in terms of firms withstanding stresses, continuously innovate, and quickly adapt to changes. With regard to sustainable innovation, in the course of interactions, financial institution's agents will modify their behavior, upon reacting to and considering the behavior of other agents, which calls for adjustments in the behavior, implying high adaptability to any changes. We can therefore conclude that *organizational resilience affects sustainable innovations.*

## Conclusion and Directions for Future Research

From the ongoing we can conclude that institutional logics, self-organization, networks, and organizational resilience combine in multiple ways to explain sustainable innovations in commercial banks during a pandemic period. However, there is need to undertake empirical studies to prove the construct combinations, interactions, and mediations that occur to influence sustainable innovations. The empirical study is especially necessary since the concept of organizational resilience has emerged in numerous fields to measure organization's capacity to resist or manage stressful events and adapt to sudden unfavorable change or internal and external shocks. The COVID-19 pandemic has affected financial institutions in many ways requiring institutions to reengineer their processes. The SBU has worked extremely efficiently in a completely unfamiliar COVID-19 pandemic situation. This phenomenon could be explained by the various bank innovations which provided fast-paced adaptability to cope with the current COVID-19 pandemic and enable sustained growth.

Stanbic bank (SBU) offers a good example of reinventing their operations. Currently, a good number of clients are transacting business online. Benefits of innovations in SBIU include:

1. Energy efficiency: A drop in energy utilization and a drop in fuel consumption.
2. Paper consumption dropped, following the recycling initiatives on archival boxes and implementation of paperless deposits, backed by continued momentum on the banks digital and alternate channels (Stanbic bank annual report, 20,120).
3. All the branches are now operating and staff are back to work. This clearly indicates that financial business sentiment has been boosted.

Secondary, SBU had to quickly self-organize and adapt in order to serve its customers. COVID-19 period forced SBU to create connections among financial institutions and technology companies and regulators in new ways. The resulting interactions and innovations increased the pace of self-organization and the establishment of activities like business recovery and continuity planning, and crisis management which are vital for sustainable innovations. The web of networks established resulted in sustainable innovations. However, it is worth noting that some of the product, process, technology, and social innovations are incremental in nature and benefit from coordinating a stable network of alliances. I hope these networks will be

sustained, developed, and utilized. However, there is need to undertake empirical research to ascertain the link between the institutional logics (market logic, stakeholder logic, professional logic, social logic, and sustainability logic), network ties, resilience, and sustainable innovations in financial institutions.

Although the current economic and social impacts of the COVID-19 pandemic are detrimental, financial institutions may have to innovate and provide sustainable finance products to scale up their commitments toward engaging in environmental and social encounters in a responsible recovery. The digital economy is creating new business models with stronger emphasis on resource optimization. Engaging in partnerships and cocreating funding models will satisfy the needs of the current bank customers while ensuring meeting the needs of the future generation. Self-organization and adaptation has created green customers, efficiency, and cost savings in financial institutions. The need for office space has shrunk with work from anywhere being the norm of the day.

# Sustainable Leadership

Bahaudin G. Mujtaba and Frank J. Cavico
Huizenga College of Business and Entrepreneurship, Nova Southeastern University, Fort Lauderdale, FL, USA

## Synonyms

Effective leadership; Ethics; Success; Sustainability

## Introduction

We define sustainability as long-term success in leading or influencing others toward some worthwhile vision and goals. The topic of success is something that has been part of discussion for thousands of years by human beings, especially business people, scholars, politicians, and spiritual leaders. In this entry, we focus on and reflect upon understanding sustainable success in leadership and its relationship to certain key pillars and values such as legality, morality, ethics, and social responsibility. If a person is a good decision-maker and is perceived as an effective leader for consistently acting legally, morally, and in a socially responsible and sustainable manner, then he or she likely to be a successful leader and will be able to sustain that success for the business, enterprise, and organization. However, before an individual can attain the status as a leader, one must first be a successful person. As such, we discuss some of the attributes and characteristics of the successful person for sustainable leadership. In this chapter, we present material on sustainable leadership as the main pillar of long-term success.

Success seems to have a different definition by each author writing this important topic depending on his or her needs, goals, desires, and circumstances. However, success is often seen as the progression toward certain goals. For

example, going to school and finishing the first grade is a sign of success as is graduating from middle school or high school and so on. The same can be applied to one's business, professional, or entrepreneurial life as well. One of the main reasons individuals do not embark upon the "road to success" in their professional lives is their personal concern that they will fail. This fear of failure, and believing that one will fail, can certainly increase the likelihood of failure. The reality of life is that one is likely to eventually become what she/he thinks about often as well as the way she/he pictures his or her life. For example, if one sees himself or herself as happy and healthy, then she/he is likely to be involved in "fun activities and endeavors" and eat foods and do activities that are healthy. On the other hand, if one sees himself or herself as an ineffective leader or entrepreneur, then she/he is likely to become ineffective or she/he will certainly avoid being put in such position where one is challenged. Therefore, the key to successful leadership and entrepreneurship is having a positive attitude and moving forward with a "can do" mentality. One should remember that it is important to love what you do because wealth and success are usually a natural corollary of doing what one loves. As you may have heard it, love what you do and you will surround yourself with the roots and branches to success and happiness in life.

## Success and Sustainability

According to Earl Nightingale, the motivational speaker, success is not necessarily the "destination," but rather success can be defined as the process of incrementally moving toward something that is predetermined to be worthwhile. One definition of success is that it is the progressive realization of worthwhile and predetermined goals which focuses on the process of working toward valuable ends. Of course, to be successful, you must set worthy and attainable goals. A person can naturally "aim high" and "think big," yet nevertheless one should start out modestly considering the "facts on the ground" and one's conditions, knowledge-base, and capabilities. If you set smaller and more modest, and thus more readily achievable objectives, and then attain them, and next set more achievable goals and attain them too, you will be "on the road" to a very positive, "onwards and upwards" journey to success and fulfillment and sustainable success. Of course, make sure your short-term objectives fit into your long-term goals and naturally be committed to achieving both short-term objectives and long-term goals.

A critical factor will be to develop and enhance your skills, knowledge, and expertise by a variety of methods – such as training, education, continuing education, workshops – seminars, and conferences as well as learning from traditional and online sources of knowledge and information. Of course, and the next point is obvious, make sure you have basic competencies in the "3-Rs": reading, writing, and arithmetic. You should strive to accelerate, expand, and improve your scope and rate of learning and knowledge acquisition beyond the basics. You should also be prepared to "re-tool" yourself if necessary in order to develop a new field of endeavor. In addition to acquiring and developing "hard skills" you should develop the "soft skills," such as speaking in public and communicating on a personal level with people. Yet what if a person is shy or diffident? Well, then, one should look for opportunities to speak publicly and to communicate and then force oneself to become active and engaged. It is important to be a good communicator (ideally in more than one language). You should have and be able to demonstrate strong collaboration skills and thus be able and willing to collaborate to achieve organizational strategies and goals through sustainable leadership (see Cavico 2014; Cavico et al. 2015; Mujtaba 2014; Thomas 2017).

One should always have a positive attitude as well as a good work ethic, and you must always act in an honest and ethical manner. Having a reputation for integrity is a critical factor to one's success.

You must be prepared to challenge conventional beliefs and perceived "truths" and be prepared to engage in critical thinking and analysis. Yet you should possess common sense as well as a "healthy dose" of realism. For example, find out

what you like to do and do well. Yet note that you do not have to be good in everything; as such, realize that others will be able to assist you in weak areas. Conversely, it is also important to find out what you do *not* like to do and do *not* do well. And do not worry if you are not sure what direction to take; be persistent when moving toward worthwhile goals and you will figure it out the rest by learning and adjusting. Recall the old maxim: "There is a person for every job, and a job for every person." So, if necessary, start part-time, be a temporary or entry-level employee, be an intern; but all the time you will acquire knowledge, skills, and experience and thus will be able to advance to full-time as well as to expand your knowledge and skills base.

Learn by doing and learn from your mistakes; and be able and willing to admit your mistakes. Admit that you may need to be educated and trained. Consequently, "own" your errors and then be willing and able to move forward from those miscues. The idea is to take responsibility for your actions, which is what trustworthy people and leaders do.

Naturally, look for role models; learn from successful people; seek their counsel; and learn from mentors and coaches. Accordingly, seek out the counsel and advice of these people (and do not be shy about it, yet do not be a "pain" either). Look for a leader who nurtures talent, who is willing to spend time with you, take an interest in you, and answer the questions you ask in an honest fashion. Look for someone who will "take a chance on you." The object is for you to achieve excellence, to become very good, to be recognized as being very good, at something, and to be recognized as a high-achiever. You also want to be regarded as a "go-to" person in your firm and organization; that is, you can solve problems, even if they technically are not in your job description, or you know the person who can solve someone's problems.

You must develop your leadership skills. As such, strive to be the leader of a team, department, division, and ultimately an organization. And in your role as a leader you should provide people with education, training, and skills for them (and concomitantly you) to be successful. Be a teacher of others; empower competent people; and as they rise you shall rise too. Look for hidden and untapped potential in employees and others and seek to draw them out into jobs or tasks you feel they would be good. Yet note that at times it can be a "hard sell" to push people into jobs or tasks they feel they are not qualified for or able to do. Consequently, you may have to encourage and motivate people and provide them with a sense of safety and security. The objective is to create and develop relationships where both parties receive value. Overall, you must create a culture of respect, mutual support, openness, and success, and as such you should strive to establish a nurturing and caring culture and one of fun too.

There is nothing wrong with self-interest, making money, and being successful financially, even very successful. There is, the authors emphasize, no substitute for the traditional "work ethic and "hard work," which will pay off in long-run. One should always attempt to save money, and for a young person starting the authors suggest 10% of one's earnings in case of a "rainy day." It is best to prepare a budget, keep track of expenses, and keenly know the difference between mere "wants" and "needs."

Yet in addition to all the hard work, you also should have a "family life," which will bring the proper balance to your life. The idea is to achieve a "work-life" balance and allow yourself time to relax, reenergize, reset, and have quality time with your family and friends. This balance will afford you the opportunity to build relationships with people, get counsel and "feedback" – from family, friends, co-workers, clients, and customers. And listen carefully to different points of view and weigh and measure opposing opinions.

It is critical for you to be successful, and ultimately at a high level, to be responsible, reliable, and dependable. It is also critical for you to develop a well-deserved reputation for integrity, ethics, honesty, and trust. You must demonstrate respect for people. The idea is for you to respect all and to be respected by all. Moreover, you should get engaged in the community and charitable and civic affairs; be socially and environmentally responsible (that is be "sustainable"); be a volunteer; and help others financially and with

your time and effort. Remember the old adage: "You can do well by doing good."

Have a positive attitude; be optimistic; have a "pleasant personality." Also, be forgiving and compassionate. Be modest and avoid arrogance and self-righteousness. As such, be willing to share credit for successes. Similarly, avoid negativity and negative people; associate yourself with positive people; and do not be negative with yourself; do not admonish yourself; do not upbraid yourself; and do not dwell on the past. Overcome any rejection, which is inevitable in life; do not take rejection personally. Therefore, learn from the past and move on – onwards and upwards. And this point seems very basic, but today it must be emphasized especially for young people: Do not use illegal or intoxicating drugs or substances for the purpose of simply getting drunk or a "temporary high." No one is going to hire you or keep you for long if you do drugs!

To be successful at some point, you will have to take some chances and risks, and do so but make educated and intelligent choices. Look for opportunities; take advantage of opportunities; and if need be you can try to create opportunities where you can apply and demonstrate your knowledge, skills, and capabilities. As such, be entrepreneurial, innovative, nimble, and adaptable; have a strategy for success and the tactics to achieve that strategy. Execute your strategy for success; have "to-do" lists (short-term and long-); have goals (again short-term and long-) and objectives; then achieve them, and, as pointed out previously, set more goals and objectives and achieve them, and proceed so-forth-and-so-on. To be a successful person, you need to take a long-term perspective as well as to be willing to undergo some short-term sacrifice and expense to maximize your own greater, long-term good. It is important in today's interrelated economy and global society for you to be aware of globalization and to be culturally mature and competent.

The idea is for you to be a "shaper" and not a mere "reactor"; and thus for you to be willing and able to spot and to respond to new circumstances. Also, be aware of your "blind-spots," that is, weak areas that you need to develop; but also be cognizant of "hidden-strengths," that is, the knowledge, talents, skills, and capabilities that you are not using or perhaps using but not adequately publicizing.

Naturally, it helps to have "good luck" and good fortune, that is, as Machiavelli said: "For the Goddess Fortuna to smile on you." Yet, the authors submit you can "make your own luck" by persistence and perseverance, empowering yourself, being competitive, taking advantage of opportunities, and making opportunities. As Machiavelli also said: "Fortune favors the young for the young are bold." That is, the "young" (including the "young at heart") will take more risks (perhaps because they have less or little to lose). Moreover, the authors also submit that the harder you work the luckier you will be.

So, to conclude this discussion of your personal success, the authors emphatically state that if you take heed of the authors' advice there is a great future for you out there!

Once you have become a successful person what must you do to be a successful leader? Very simply, on a foundation of your personal success and good and sound decision-making, you must be cognizant of and prepared to deal with certain values; these values will be your "pillars of success." A value is simply something that possesses worth. Accordingly, the authors will now examine the values of legality, morality and ethics, social responsibility, and sustainability in the context of leadership, particularly leadership in business.

This entry's discussion of values is not merely an "academic exercise"; rather, as will be seen these values have real-world implications, especially for a leader. These values, moreover, are not separate concepts; they are not academic "silos"; rather, these values must be applied and integrated into the activities, conduct, strategy, and tactics of a firm or organization. Along with sound and good decision-making, adherence to these values will be keys to success, and sustainable success, for the leader and his or her firm or organization. The goal is to effectuate positive and beneficial changes and to create long-term value and to sustain that value for yourself, family, business, organization, community, and society as a whole.

That is, for you to build on the pillars of success and to be a sustainable leader of a sustainable organization.

### Success is About Persistence

While speaking at the 1995 Society of Human Resource Manager's conference in Orlando, Barbara Bush told the audience that "Your success as a family, our success as a society, depends not on what happens in the White House, but on what happens inside your house." She is right because success comes often from ordinary individuals who are committed to the achievement of their dreams. As can be seen, some really amazing things happen to ordinary people. Extraordinary results can be achieved if you have meaningful goals that are accompanied by the right *knowledge*, ***e****ducation*, and a ***y****outhful* mentality (K.E.Y.) which symbolizes energy, risk-taking, and continuous growth.

There are many individuals, companies, and ideas that started without much success and did not look very promising at the beginning, but they turned out to be very successful because they had a vision of the future, set goals with determination to achieve, and stayed persistent to turn their goals into reality. The most consistent trait in all successful projects and individuals seem to be hard work and persistence. The following some examples of persistence and hard work.

1. *Ray Kroc* was an unsuccessful marketer of restaurant equipment and did not sell the first hamburger until the age of 52. That is when he founded McDonalds which is the largest food chain in the world.
2. *W. Edward Deming* was attempting to help American corporations in the area of quality, but found that companies in the United States were not interested in his ideas because Americans wanted quick solutions that turned high profits quickly. So, when he was helping the Japanese government with their census calculations and statistics, they asked him for help in the area of quality control techniques. Consequently, in the 1950s and beyond, he was able to help them win the world over because of quality and efficiency in their products.
3. *Alexander Graham Bell* offered to sell his telephone patent to Western Union for $100,000, but Western Union turned it down. They did not see much value in something that has literally and virtually changed how the world communicates today.
4. *Edwin Land* created the instant camera and tried to sell his idea to Kodak but was not successful. So, he started Polaroid Corporation which became very successful and a competitor to Kodak.
5. *Bruce Lee* was rejected for the television show called "Kung Fu" because he was not an experienced actor. So the directors of the show decided to use David Carradine as the star of the show. However, Bruce followed his dream and turned it into reality.
6. *Michael Jordan*, basketball star of the Chicago Bulls, did not make the first cut at his high school basketball team. However, he later became one of the best basketball players of the 1990s. He led his team to four NBA championships. It was announced that by the time he was 30 years of age, he had missed over 9,000 shots throughout his college and NBA basketball career; yet he was one of the best players of the decade because he kept setting higher goals and learned to make them happen by working hard and continuously learning.
7. The *Radial Tire design* was rejected by most of the auto tire companies because the cost was too high. Finally, Michelin started manufacturing the high-priced and better quality radial tires which gives them a competitive advantage in the industry.
8. *Walt Disney* was originally fired from his job at a newspaper company for lack of ideas. He went bankrupt many times before he began building Disneyland.

As can be seen from the above examples, hard work and persistency can pay off in the long run. Love, wealth, and success are all within reach both in one's personal and professional lives so long as one is working hard while being reasonably persistent. As a manager, and as a leader, one must continue to learn the best ways to create success for oneself and one's colleagues through

the pillars of legal, ethical, socially responsible, and thus sustainable leadership.

## Success Requires Knowing, Showing, and Leading the Way

As professionals, all managers and leaders should "romanticize" for better days if they are to be visionaries and futuristic. Besides knowing the way toward this idealistic future, successful leaders must go the way and show the way to designated and appropriate followers. Eva Gregory, coach and author, said "I see no point in looking back at what I didn't get done. I choose, instead, to acknowledge where I am and where I want to be; then determine what steps it will take to get me there." Wisdom comes from experiencing an event, an idea, a concept, or an endeavor; therefore, all failures can be seen as experiences which lead to knowledge and wisdom. Professional experts are good people and they are good because they have come to wisdom through experimentation and failure. Ralph Waldo Emerson said that "Bad times have a scientific value. These are occasions a good learner would not miss." There is very little wisdom in success. So, success should be judged accordingly as Robert Louis Stevenson, author, said "Don't judge each day by the harvest you reap. . . but by the seeds you plant."

Effective leaders plan for learning and success through experimentation, structure, progress, and prioritization. Napoleon Hill said "Reduce your plan to writing. . . The moment you complete this, you will have definitely given concrete form to the intangible desire." Professionals become leaders because they are able to commit to these tangible desires and convert them into action. The modern author and motivational speaker Anthony Robbins suggests that "Deciding to commit yourself to long-term results rather than short term fixes is as important as any decision you'll make in your lifetime." Ben Stein, actor and author says: "The indispensable first step to getting the things you want out of life is this: decide what you want." This hard work of spending time to make the right decisions about a specific direction can be very worthwhile. Author Ralph Marston said "The creativity and positive energy you put forth come back to you many times over. So do the hurt and destruction. Which would you rather get back?" Once a decision has been made, then put your heart into its achievement. Psychologist William James of Harvard University said "Most people never run far enough on their first wind to find out if they've got a second. Give your dreams all you've got and you'll be amazed at the energy that comes out of you." According to Professor James, "It is our attitude at the beginning of a difficult task which, more than anything else, will affect its successful outcome."

Instead of focusing on being more determined, some people are much too concerned about their competitors and the actions of others. Grace Lichtenstein, author, wrote that "Your opponent, in the end, is never really the player on the other side of the net, or the swimmer in the next lane, or the team on the other side of the field, or even the bar you must high-jump. Your opponent is yourself, your negative internal voices, your level of determination." Charles Kettering, inventor and businessperson, said the following about imagination: "Our imagination is the only limit to what we can hope to have in the future." Julian Simon, economist, put it nicely when he said: "The main fuel to speed the world's progress is our stock of knowledge, and the brake is our lack of imagination." Besides "Imagineering," a leader needs to envision the results and final outcomes. "Think and feel yourself there! To achieve any aim in life, you need to project the end-result. Think of the elation, the satisfaction, the joy! Carrying the ecstatic feeling will bring the desired goal into view" said author Grace Speare. Commitments must be aligned with one's actions and beliefs in order for progress and success to follow. Dorothea Brande, author, said "All that is necessary to break the spell of inertia and frustration is this: act as if it were impossible to fail. That is the talisman, the formula, the command of right- about-face that turns us from failure toward success."

Ralph Waldo Emerson encouraged everyone to "Finish each day and be done with it. You have done what you could; some blunders and absurdities have crept in; forget them as soon as you can. Tomorrow is a new day; you shall begin it serenely and with too high a spirit to be

encumbered with your old nonsense." Instead of being too focused on the past, current and aspiring leaders and managers need to be forward-looking and anchored toward the future that we all desire for ourselves and our children. Productive individuals and effective leaders are forward-oriented and, at challenging times, use professionalism to create synergy with people of diverse backgrounds, ethnicities, religions, and languages. *Professionalism* can be operationalized at all localities at the individual level by putting the needs of others in the community, organization, society and country above one's own through accountability, compassion, integrity, and mutual respect for all human beings and living creations in the society. Professionals can use good judgment to develop their colleagues, peers, employees, students, friends, and children as per the requirement of each task or situation and their level of readiness. These professionals can use inspirational, legal, ethical, and socially responsible leadership to positively influence the development of everyone around them.

As a professional, manager, or a leader, one must continue to learn the best ways to create success for oneself and one's colleagues. Of course, there are many ways to learn about leadership, management, ethics, and character. As such, one should not limit learning to formal education or specific leadership seminars. Regardless of where one learns about management and leadership, it is the effective application and execution of relevant concepts in each situation that can deliver results for managers and leaders. What is important is the understanding that one can chisel the character he or she desires for himself or herself over a lifetime. For effective leadership, it must be emphasized that building a strong character that is a symbol of integrity, honesty, and courage cannot be built overnight because it requires hard work, persistency, and progress toward a brighter future for all stakeholders.

## Leadership

Now that you have heeded the authors counsel, and as such once you have become a successful person, you should aspire to the lofty and noble role of the leader of an organization. Good people want to work with excellent leaders. People usually do not leave their jobs because of the organization or money, but they most often leave because of bosses and managers who are not seen as effective leaders. So to have a sustainable level of success in the long-term, one must be working toward effective leadership.

Leadership is often associated with integrity, vision, direction, and persistence. Overall, leadership is about leading people, teams, and colleagues toward a worthwhile and common goal by building strong relationships and developing them to be efficient and effective. According to Professors Gary McGrath and J. Preston Jones, at a presentation at an alumni gathering on November 4, 2017, in Fort Lauderdale entitled "*Leadership in Two Directions,*" "dictator" and "push-over" leaders are about 14% and 12% effective, respectively. However, leaders who exercise a balanced approach to leadership based on the needs of the situation and followers tend to be about 74% effective. Balanced leaders demonstrate the highest levels of accountability and compassion while building effective relationships to help everyone jointly achieve their common goals.

As emphasized by the authors, a leader must know the way, show the way, and lead the way. A leader must make sound business and public policy decisions and also he or she must be proactive, that is, become a "shaper" and not a reactor, thereby anticipating challenges, knowing the way, showing the way to solving them, and leading the way to solving these challenges. It is critical to the long-term success of the leader and his or her organization for the leader to embrace and demonstrate legal and moral behavior, that is, to establish corporate culture of legality, morality, and ethics. Society expects that business and other organizations today will act not "merely" legally, but also morally, and then, especially for business when a business reaches a certain size and stature, to act in a socially responsible and sustainable manner too, and thus have a positive impact on stakeholders, including society as a whole and the environment. Therefore, the leader must be

prepared for these issues and challenges; the leader must be concerned with not only the economic and legal performance of the business or organization, but also its moral and socially responsible performance. The objective is to achieve excellence in results; but to be able to sustain these positive results by acting in a legal, ethical, and socially responsible manner. As such, the first value that a leader must address after formulating a sound decision is legality. Yet as there are moral gaps in the law the leader also must go "above and beyond" the law and act in an ethical manner as well as a socially responsible manner.

## Purposeful Destinations

Let us emphasize that success in workplace leadership can be seen as being built on a foundation of legality, morality, and social responsibility and the premised on the progressive realization of worthwhile and predetermined goals through strong relationships with teams, employees, colleagues, superiors, and other relevant stakeholders. Whether is workplace success or personal success, people's greatest need in life is to find a purpose. Throughout our lives, we go through a number of different stages – birth, childhood, schooling, first job, career development, marriage, parenting, grand-parenting, retirement and at the end, without exception, death. During our lifespan, two very important questions tend to come up: (1) Who am I? (2) Why am I here? These questions take time to figure out. For some, it may take a few months; for others may take years; and for some, it may take the experience of a lifetime to determine one's individual purpose.

We need to remember that we are the only ones that have experienced our own lives. No one else has ever gone through our own unique trials, tribulations, and triumphs. Our task of defining our own individual power of purpose must come from within. It is not the definition that our spouse, parents, relatives, business associates, and friends have developed for us, but that of our own. To help find your true purpose, you and your teammates can reflect on the following questions:

1. How can I make a difference?
2. What skills can I build on to develop my career?
3. How can I find meaning in my life?
4. What is the best way I can contribute?
5. What can I best excel in?
6. What obstacles can I overcome and use my knowledge to help others?
7. What kind of legacy do I want to leave?
8. How may I receive eternal life?
9. What am I willing to sacrifice in the short-term in order to develop my long-term purpose?
10. What is the payoff for staying true to my purpose?
11. What possible recognition might I be able to receive?
12. Why is developing purpose important to me?

Remember that one of each leader's and each manager's purpose in life should be to help others develop, plan, implement, and achieve their very own dreams. As a balanced leader who exercises high accountability and compassion, you must always have the hindsight to know where you have been, the foresight to know where you are going, and the insight to know when you are about to go too far. If you can perceive and believe in success, then you are very likely to achieve it as well. The goal of sustainable leadership is to always achieve your purposeful personal and professional goals through legal, moral, ethical, and socially responsible means. These are the pillars of success and sustainable success.

Awareness of the law is, of course, essential for the leader of any business or organization today. Many laws today regulate conduct, especially business conduct. There are constitutions, statutes, administrative rules and regulations, and case law. The USA is a federal system, moreover, so there is national, that is, federal law and state and local law; there also exists the extraterritoriality of certain US statutory law, that is, its power to govern conduct in other jurisdictions. So, obviously, there is a lot of law to be concerned with, but there are naturally a great many lawyers to advise people, businesses, and organizations.

Yet, obeying the law is not enough, since, as emphasized, there may not be any law, or the law may be weak, or not enforced through bribery or other forms of corruption or threats. For the true leader, there is an additional expectation today that business and as well as other organizations and entities will act not merely legally but also morally. Morals and morality and what is "right" or "wrong" are concepts based on ethics, which is a branch of philosophy. Technically, ethics consists of the theories and principles that one uses to reason to moral decisions, morality, morals, and what is right or wrong. The ethical challenge and goal for the leader, therefore, is to formulate efficacious actions that advance one's self-interest and that of the firm or organization (Ethical Egoism), are culturally competent (Ethical Relativism), and achieve the greater good (and thus to strive for "win-win" scenarios for all stakeholders) (Utilitarianism), *but* do *not* demean or disrespect people or stakeholders (Kantian Ethics). And why should the leader act in such a moral manner. The rationale, quite simply, is Ethical Egoism, that is, to make good, legal, and moral decisions based on the preceding ethical theories will result in the long-term advancement of your self-interest and that of company or organization.

The role of a leader, as emphasized, is to know the way, show the way, and then go the way. In so doing there may be an educational function for the leader, at times to demonstrate to followers and "higher-ups" what is in their long-term self-interest. In the business realm, the leader may have to show the way to top management (the board of directors, and shareholders) that acting morally will benefit the company in the long-run. Another function for the leader is to create at one's organization a culture of ethics that fosters and supports moral behavior. The objective is to establish a well-deserved personal, corporate, or organizational reputation for integrity and trust. It should be obvious to all that once a reputation for trust is lost, it is very difficult to get back.

Another value that emerges as a challenge for leaders today is the concept of social responsibility. This is a societal expectation "above and beyond" the law as well as morality and ethics. In the business realm, the expectation is that a company or firm will be a "socially responsible" one and a good "corporate citizen," even though there may not be any legal obligation to be socially responsible. Social responsibility has been traditionally viewed in a charitable sense. That is, business, in particular, engages in charitable activities and philanthropy as well as civic and community activities, for example, from simply donating money to charities (and taking a tax deduction, of course) to a company releasing its employees to work in approved charities. Social responsibility is a broad enough notion to encompass sustainability as a *means* in the form of environmental conservation and protection as well as "green" energy production via solar and wind. One perhaps is familiar with the "3 Ps," that is, People, Planet, and Profits" as well as the "Triple Bottom Line" (Economic Prosperity, Environmental Stewardship, and Social Responsibility). Moreover, social responsibility can also include Social Entrepreneurship, for example, developing and selling hydrogen-fuel-cell-powered batteries for vehicles and equipment.

Sustainability is another important value, theme, and challenge for the leader today. Sustainability is a notion tied to the values of law, ethics, and social responsibility. More generally and broadly stated, sustainability can mean taking care of people's present needs without compromising future generations and the planet. Regardless of the exact definition today, it would be implausible for any global company or organization to exclude sustainability from its agenda, policies, and activities. Sustainability, therefore, has many dimensions, but this notion is based on a foundation of legality, morality, and social responsibility. We advise that sustainability should be viewed first as MEANS in the sense of environmentally responsible actions (such as conservation, protection, and "green" production of energy) and secondly as an ENDS, that is, by acting to have a sustainable planet for future generations as well as to achieve sustainable success for yourself as a leader and your company or organization.

## Conclusion

The authors have emphasized that there is an expectation today that business, organizations, as well as the public sector, must act legally, morally, and in a socially sustainable, and environmentally responsible manner. These are the pillars of success and sustainable success summarized from former publications (see Cavico 2014; Cavico et al. 2015; Mujtaba 2014; Thomas 2017). As such, the leader today must be prepared to recognize and deal with these "real-world" challenge, that is, to fulfill these expectations and to meet these challenges in an effective and efficacious manner. And what are the rationales for undertaking and meeting these challenges. The reasons are success – personal and organizational, and the sustainability of that success, that is, sustainability as an "ends." If you heed the authors' advice, we sincerely believe you will achieve success and will be able to sustain that success for yourself, your company, your community, for society as a whole, future generations, and for the planet.

The objective is to be a legal, ethical, and socially responsible global leader in business or the public sector. You naturally want to do well yourself, but also to make a positive contribution and have a positive impact on your firm, the community, and society. So, how do you achieve success? How do you sustain success? What is the formula? It is just to make sound decisions plus being a legal, ethical, socially responsible, and sustainable enterprise! That is the mindset! Those are the pillars. Or in other words for a business, very simply, to be a "good corporate citizen."

The formula for sustainable leadership and long-term success as an individual and a leader is to develop positive attributes and to make good and sound decisions, and then, most importantly, to ask and answer following questions when contemplating taking actions: Is it legal, moral, and what should a socially responsible and sustainable company/firm/organization be doing? Answering well those questions will form the pillars of your success. The ultimate goal is to develop yourself into a successful person and then to further develop yourself into a successful legal, ethical, socially responsible, and sustainable leader of a successful and sustainable business, firm, or organization. The authors trust that the advice and suggestions offered herein will help you achieve that success as a person and eventually as a leader of a successful and sustainable organization.

# Sustainable Procurement

Haris Alibašić
Public Administration Program, University of West Florida, Pensacola, FL, USA

## Synonyms

Purchasing; Resilience; Sustainability; Sustainable procurement

## Definition

Based on the quadruple bottom line principles, sustainable procurement may be defined as the acquisition of materials and services using the most effective and efficient means with application of the environmental, economic, social, and good governance significances. The ideals of sustainable procurement apply to both the public and private sectors with some minor differences in approaches, goals, and outcomes.

## Introduction

By default, sustainability incorporates the concept of value-added benefits to procurement with an emphasized focus on the environmental and social benefits of sustainable purchasing of goods and services. In explaining the concept of sustainable procurement fully, the basic postulates and principles of what purchasing it must be evaluated and understood. The acquisition is one of the core internal services inherent to almost any organization, in the public, private, and non-profit sectors. The intrinsic nature of purchase lies in its hierarchical position within the organization. Purchasing is at the core of the service delivery in governments, and the more effective procurement services are, the more efficient delivery of service is. Theron and Dowden (2017) argued in favor of strategic sustainable procurement practices by the private and public sectors. In most cases, the public and private sector conduct sustainable procurement practices to either meet mandates set by various levels of governments and enforced by governmental agencies. Sustainable procurement is in alignment with the environmental and social justice issues, social responsibility, and governance (Alibašić 2017, 2018a).

Additionally, sustainable procurement practices may be set in place as a result of voluntarily imposed policies, out of concerns for environmental degradation. For example, in discussing innovative climate action planning strategies, Bassett and Shandas (2010) raised the awareness of procurement and purchasing of recycled content, using products with minimal packaging. The authors included sustainable supply in transportation strategies, including purchasing of low carbon fuels, replacing vehicles with hybrid and electric cars in fleets, and other relevant greenhouse gas (GHG) emissions reduction strategies. In more recent years, out of social concerns, socially conscientious procurement policies have been put in place. Those include the strategy to be more inclusive of minority and women-owned businesses, veteran-owned firms, and companies owned by economically disadvantaged individuals in the procurement opportunities. Filho et al. (2019) analyzed various barriers to sustainable procurement practices in the UK, Canada, the USA, and Australia. In addition to cost, political pressures and differences are the main reasons for lack of organizational commitment to sustainable procurement.

## Good Governance of Sustainable Procurement

A long-term application of sustainable procurement necessities that all four elements of sustainability, environmental, social, economic, and governance are included in strict procurement policies. The ecological aspect of sustainable procurement entails understanding the impact of greenhouse gas (GHG) emissions and the environmental effects the purchasing has on communities, organizations, and society. In recent years, purchasing also includes socially conscientious elements such as cultural diversity and promotion of women and minority-owned businesses. Moreover, sustainable purchasing has different qualities necessary to promote diverse industries and diverse products and services. The economic pillar of sustainability is a crucial component of sustainable purchasing in organizations committed to sustainability and reveals the cost reduction as a defining element of sustainable purchasing.

All of these three elements are then tied together into the component of good governance, sustainable purchasing it has historically been viewed as environmentally friendly the way of delivering services and buying goods for public service organizations. However, sustainable

procurement is utilized in other organizations too, including the adoption of green purchasing in the private sector devised within supply chain or other aspects of business operations. Walker and Brammer (2009) reaffirmed sustainable procurement as good governance in organizations. Good governance, along with integrity, and transparency coalesce around policies focusing on bringing about positive social changes. Sustainable procurement policies have the potential of addressing climate change concerns and social concerns, allowing for the implementation of sustainability measures to counter the adverse impacts of environmental degradation and to create a more just, safer, and healthier society (Alibašić 2018b).

## Green Procurement

Most sustainable procurement policies are focused on the environmental benefits of such strategies. Shakya (2019) provided ample examples of green public procurement strategies focusing on environmental sustainability. Organizations interested in furthering environmental goals and reducing greenhouse gas emission are vital considerations in understanding sustainable procurement policies. In recent years, organizations embraced the ecological benefits of procurement, and greening of procurement embedded within organizations. Some examples of the green procurement practices include "energy-efficient computers, low energy buildings, recycled paper, cleaning services using environmentally friendly products, electric, hybrid or low-emission vehicles" (Theron and Dowden 2017, p. 45). Other leadership strategies include sustainable energy policies with renewable energy contract and energy efficiency improvements, as examined by Alibašić (2018a, c).

## Ethical Considerations of Sustainable Procurement

Ethics is an essential consideration in understanding strategic sustainable procurement plans. Reid (2009) viewed sustainability through an ethical framework. Climate change, social inequalities, poverty levels, access to health care, housing, environmental degradation, energy, and other crises crisis are among the most relevant issues facing the public and private sectors. The public sector agencies are taking a proactive approach to become self-sustained and sustainable, including investing in strategies for more sustainable procurement policies. Preuss (2007) discussed the changing paradigm of sustainable procurement as an investment in the future. Such system change and a new standard are needed for the actual implementation of sustainable acquisitions and sustainable investments within the public and private sectors.

The case of ethical consideration in sustainable procurement is essential to the preservation of the highest standards in providing services in the public sector. Such ethical considerations are consistent with the idea of long-term planning and ethical responsibilities discussed 600 years ago by Ibn Khaldun (1406, 1969), in his work *The Muqaddimah: An introduction to history*. Rooted in morality, faith, and ethics, sustainable procurement initiatives activities are consistent with the concerns over global stewardship over the earth. Zaidi (1981) pointed to the issue of justice in exploiting natural resources. Sustainable procurement policies lead to better environmental and social outcomes, with what Worrell and Appleby (2000) described as good stewardship of natural resources.

## Private Sector Sustainability in Procurement

The interconnectedness and dependency of procurement and purchasing transcend sectors. A relevant interaction of the public sector is its dependency on the efficient provision of materials and goods from the private sector organizations, local, national, and international firms and businesses. The foundations of sustainable procurement in the private sector can be traced back to the environmental goals of the private sector and the desire of private-sector

leadership to engage in sustainable practices through triple bottom line (TBL) initiatives. The more creative and dynamic efforts for sustainable procurement are linked to the supply chain and logistics of organizations, as evaluated and discussed by Wallace and Xia (2015). Theron and Dowden (2017) argued the private sector must adopt strategies of procurement from the public sector due to the fact that private sector organizations depend on billions of contracts in procurement from the public sector. Moreover, conceptually, private sector organizations are interested in the dynamic application of sustainable strategic purchasing decisions. Meehan and Bryde (2011) perceived sustainable procurement as a strategic opportunity for organizations.

From the very beginning of sustainability efforts, corporations and businesses played a leading role in supporting the notion of a just and equitable society through positive impacts in their communities. Importantly, sustainable procurement has been expressed in the context of the economic situation of an organization. According to Theron and Dowden (2017), "many companies also view the adoption of sustainable procurement practices as a means to gain market share and deliver better service provision," including "commercial opportunities driving sustainable procurement, improving brand value, increasing sales with 'ethical consumers', meeting corporate social responsibility objectives, avoiding negative publicity, and fostering stakeholder goodwill" (p. 65).

## Quadruple Bottom Line (QBL) Sustainable Procurement

Sustainable procurement is viewed as a tool policy for positive social change in the public and private sector and is essential for effective implementation of sustainability-related initiatives. Defining the effectiveness of sustainable procurement through the lens of the overall impact on internal and external services delivery, stakeholder engagement, and the impact are essential steps in ensuring the relevance of sustainable purchasing in an organization. The ethical norms and moral standards are applied in executing policies. The effectiveness of sustainable purchasing policies is relevant to economic growth and the long-term fiscal stability of the organization, as sustainability for organizations, regardless of the sector, begins with the financial impact, coupled with the community-wide benefits. The overall effectiveness of the quadruple bottom line (QBL) approach to sustainable procurement is evaluated using the standardized sustainability measurements with specific environmental, social, and economic outcomes against the firmly established benchmark data. To provide for better transparency and integrity of sustainable procurement policies, regular reports on outcomes and results are incorporated into standard purchasing strategies within an organization.

## Conclusion

Modern organizations in public and private sectors embrace the ideals and principles of sustainable procurement. The concepts of sustainable procurement are emphasized through the economic, social, and environmental elements of sustainability. However, the increased trends see organizations deploying sustainable procurement strategies to address societal ills and improve governance, using the quadruple bottom line (QBL) approach. Organizations involved in sustainable procurement and implementation of sustainable purchasing policies are rewarded with good governance and efficient and effective ways of delivering services, leading to better leadership and ownership through a holistic, system-wide approach. The inclusion of sustainable procurement policies strengthens all the parts of an organization's strategic planning, ensuring that sustainability efforts are thorough and implemented efficiently. The quadruple bottom line approach to sustainable procurement enables a robust framework for inclusion and measurement of procurement efficacy in the organization.

# Sustaining High Performing Bureaucracies

Andrew Ballard
National Center for Public Performance,
Rutgers University, New Brunswick, NJ, USA

## Synonyms

Effectiveness; Efficiency; Innovation; Maintaining; Performance measurement; Quality improvement

## Definitions

*Performance Management* is the process of integrating operational data that track a series of previously determined targets into the organizational decision-making process. Targets are created with the ideals of efficiency, effectiveness, and service quality in mind (Behn 2014). This differs from the process of *performance measurement* which refers to simply the collection and reporting of organizational indicators.

## Introduction

In an era of declining government revenues paired with ever growing calls from a diverse

constituency for improved services, the need for public organizations to deliver on their promises is vital. Current scholarship suggests that performance measurement has the potential to significantly contribute to improving the delivery of public services (Berman and Wang 2000; Rivenbark 2000; Schick 2001; Poister and Streib 1999; Sanger 2008). Performance-based management aids informed decision-making for public managers, the results of which are widely applicable for public programs at various levels of government (Hatry 2006; Kettl and Kelman 2007). Significant research exists examining what leads an organization to adopt a performance system and what type of organizations are most likely to do so; however, what is less known is how organizations can sustain these systems in the long term and avoid a boom-bust cycle of managerial reforms (de Lancer Julnes and Holzer 2001; Taylor 2011). This study explores the practitioners' use of performance information in government, by investigating the obstacles that prevent practitioners from building sustainable systems.

To be effective, a performance measurement system must go through three stages – i.e., adoption, implementation, and sustaining. Attention has essentially, with proper reasons, focused on factors influencing the use and the implementation of such systems, less attention paid to the development of sustainable practices. The process of utilization of performance systems includes two stages: adoption and implementation. "Adoption represents the development of measures of outputs, outcomes, and efficiency" (De Lancer Julnes and Holzer 2001, p. 695). On the other hand, "implementation refers to the actual use of performance measure for strategic planning, resources allocation, program management, monitoring, evaluation, and reporting to internal management, elected officials, and citizens and the media" (De Lancer Julnes and Holzer 2001, p. 695). In sum, to fully benefit from performance measurement systems, public entities must institutionalize the system as one fundamental element guiding business conduct. Doing so requires the advancement of a third component, sustainable practices, which in turn demands an understanding and analysis of practitioners' perspectives.

## Using Performance Information

### Human Resources Management

The use of performance information can significantly improve human resource management. The effects can be categorized into two major factions: (1) the effectiveness of human resource management and (2) employee motivation and commitment. In regard to the first dimension, organizations have exhibited improved assessment of the human resource needs for the organization. Performance systems help identify insufficiency in the workforce as the major cause for a department not reaching its objectives as well as a need for greater flexibility in employees' schedules to enhance the results obtained. In addition, performance measurement systems have enabled managers to enhance the scope and the focus of training programs that public organizations offer. One concern often expressed by employees is that performance information usage in budgeting and HR will just lead to cuts; however, research suggests that information is used in diverse ways by managers when considering employment levels and employee needs and that the usage of such information may enhance the experience of people working in the organization.

In the second dimension, performance can help progress in employees' motivation and commitment to organizational goals. This does not only apply to frontline employees but also to upper-level managers. The use of such a decision-making system can enhance collaboration, engagement, and creativity at all organizational levels.

### Communication

The use of performance measurement information produces numerous effects in the interaction of public institutions with their stakeholders. Improvements have been observed in the domains of transparency, accountability, and public trust. Performance systems help design of greater tool sets for citizen participation/input, increase

customer satisfaction, and increase transparency for customers and even bring stronger citizen confidence. The use of performance information has the feature of improving reporting to stakeholders, in particular to the executive and the legislature. The use of performance information enhances the internal communication between departments and between levels of government.

### Financial Resource Allocation

Budgeting is the third area in which result-based information frequently produces noticeable outcomes. These outcomes can be classified into two categories: (1) efficiency effects and (2) resources allocations. The use of performance information results in a significant reduction of the cost of operation and a more effective use of the resources allocated. These savings are often achieved through reductions in overtime expenditures, less wasteful spending, and access to increased funding from external organizations. The adoption of public performance systems allows public institutions to have a proactive approach to resource allocation.

## Barriers to Performance Use

### Capacity Limitations

The first limitation associated with sustaining a performance information regime is linked to the development of the system itself and to the challenges entailed in obtaining reliable information. In many instances, due to the complexity of the phenomenon at issue, it is difficult to quantify some of the elements in place as well as establish the causal relationship between input and output and outcomes. There appears to be a positive relationship between how well programmatic goals can be operationalized and the likelihood of a sustained performance effort. In addition, the debate over what is *important* versus *essential* or *measurable* versus *deliverable* seems to generate internal debate. This issue of usability does not exclusively rely on the accuracy of the measurement but also on the amount of information collected. There appears to be a frustration effect at play. Individuals working in these systems are exposed to a glut of data that are either improperly linked to desired outcomes or outdated upon arrival. It stands to reason that systems are likely to fade if they are perceived as ineffective.

Another fundamental barrier to using results-based information lies in the maintenance and the adaptation of the system. This seems to impose a particular burden on public managers to capture the rapid evolution of the environment and the context considering the limited human and financial resources: Likewise, it may not be appropriate to immediately use and integrate the information into the decision-making process if existing systems, especially in terms of technology, have not been upgraded. It is rare to see implemented technologies such as dashboards or mobile devices, which could continually improve the usability of the information. In general, capacity limitations result in a lack of ability to ensure the appropriateness of the system itself towards its objectives. One respondent deservedly stated. Paradoxically, a system that is intended to allow organizations to do more with less may actually lead to organizations doing less with the same.

### Knowledge Limitations

Knowledge limitations refer to the lack of experience and understanding of performance management principals within the organization to properly use results-based information. Although the information may be accurate and reliable, if decision-makers do not know how to integrate it into the decision-making process, improvements will not occur. Bureaucrats worry the communication that occurs among the different parties will be partially based on inaccurate analysis or interpreted with insufficient understanding. Public managers cite insufficient of knowledge of proper accounting principles and process design as recurrent barriers to result-based information use. Line staffs are rarely familiar with the concept of performance measurement, as the system does not directly relate to their daily tasks. This lack of clarity, as reported, creates a general skepticism towards data-driven decisions. Another element relates to the difficulty in setting appropriate targets for performance achievement. Comparing yourself against solely internal trends (internal

benchmarking) can sometimes be insufficient in motivating performance; however, finding appropriate external benchmarks is often beyond the abilities of organizations.

### Buy-In Limitations

This kind of limitation directly relates to the inducement of stakeholders to use result-based information. Some either refuse to accept the value of performance or they do not want to embrace the concept. Even if all the conditions are in place for proper use, if people deliberately disown the information, the system will not produce any improvements and will likely fade as time goes on. Individuals' unwillingness to buy in is often the result of three coexisting phenomena: the lack of strong leadership, the perception of perverse effects, and the resistance to organizational change. Half-hearted leadership on the part of top management is a fundamental barrier for maintaining these efforts. Research has emphasized the need to have internal champions who would strongly support the initiatives of performance measurement. It appears that public managers inadvertently maintain their *"natural"* output orientation soon after the change brought from the outsiders. This evidence would suggest a nuance to the existing literature examining the importance of leadership buy-in. Newly elected officials may be seen as outsiders looking to change things for the sake of change. Buy-in is needed from both elected leadership and internal management for these systems to take root.

Widespread negative perception of result-based systems seems to create another limitation. A common anxiety among staff is that the information available could be used wrongly against them. Public employees are often reluctant to share result-based data, as they worry about confidentiality and fear they will be blamed for poor outcomes or lack of progress. Finally, the unwillingness to incorporate performance information as a foundation of public organization administration seems to stem from an aversion to change in general. The hesitancy towards change was recognized both at the organizational and individual level along with a strong desire to maintain the status quo. Senior managers who have been in the organization for long are more reluctant to promote change and therefore, to habitually deny the validity of performance systems.

## Building a Sustainable Performance System

### Financial and Human Resource Factors: Addressing Capacity

The resources devoted to performance systems are a critical element, not only during the development and adoption stage, but also during life of the system. Sustaining such systems in the long run requires stable and adapted financial and human resources: This suggests that during times of fiscal strain, the value of performance systems may not be enough to justify the necessary expenditures needed to maintain them. Gathering, cleaning, and analyzing information can require significant time and effort, and sometimes department heads have to pull staff from their "normal" duties to provide data. Sustaining performance measurement systems is perceived as quite labor intensive.

High turnover in some organizations is one of the major elements influencing the ability to fully operate the system – collecting the data and analyzing the information. High turnover produces two major implications on the sustainability of performance systems. The departure of experts deprives the organization of their knowledge and proficiency in performance management. At the same, this turnover causes the organization to perpetually hire and train new employees, increasing the cost associated with the performance system and its effectiveness. The placement of staff into performance analyst positions on an ad hoc basis seems to hinder long-term success of these endeavors. These people are more likely to leave or relocate within the organization leaving a capacity gap.

## Technical Factors: Addressing the Knowledge Gap

Technical factors appear to contribute to a sense of consistency and accuracy of information.

A serious concern is a lack of an agreed upon common framework that guides the measurement development, data collection, analysis, and reporting.

The data collected in organizations are frequently limited to financial data, so the use of performance measurement information is largely constrained to things that are tracked by those existing platforms. The ability to include performance information within the decision-making process can be limited because that performance information source is constrained and the essential information for accurate improvement and reporting is not available in a timely fashion. Sometimes a tremendous effort has to be made to collect and verify data for specific projects which hindered efforts to make decisions in close to real-time. Another barrier this lack of robust data presented was the reliance on measures that may not be really measuring what the organization cares about. Analysts often have to pick data that are less than ideal and make do with what they have, resulting in a declining level of confidence in the conclusions.

Although the sustainability of performance systems depends on several technical factors, a key element relates to the cultivation of a "home-grown" system, which can better capture the unique needs of the organization. Indeed, the ability to make adjustments along the way is equally important in establishing a sustainable system. Public organizations deal with a diverse constituency placing various, and often conflicting, demands on them. Simply using an out-of-the-box system does not capture these nuances and the need to build one that is relevant to the specific needs of the organization is important.

## Cultural Factors: Addressing Buy-In

Cultural factors are the last component in sustaining performance systems. Organizational culture needs to be nurtured to support the effective use of performance information, especially in accommodating new perspectives in the decision-making process. Those who note success in maintaining a performance system over time were much more likely to suggest that a culture of performance and an integrated appreciation for data usage was engrained in every level of the organization.

The institutionalization of performance management relies on the likeliness of participants to intuitively use that information in their daily operations, relying on the willingness of few strong stakeholders. In government, one of the largest difficulties is sustaining the performance measurement effort across elections cycles. Change in leadership creates irregularity in the objectives pursued and on the affirmation to use result-based information. Therefore, promoting the use of performance information as part of the organizational culture lessens the influence exerted by officials. There exists a need for top management to use their discretion in the way of conducting business in public organization to overcome the lack of legal mandate to use performance information and to ensure the sustainability of those systems.

Leadership is not the sole factor in determining whether performance measurement can flourish in an organization; support and cooperation from every level of management is equally essential. A sustained performance system cannot be accomplished without front line employees. If the employees of an institution do not perceive any benefits from using the system, it will not be able to produce any improvements and will probably be abandoned. Management and employees alike can sometimes dismiss performance management practices because either they do not fully understand the purpose of the system of they have not been integrated into the system development process.

The diversity of goals and objectives government is pursuing makes it difficult to focus on a single policy or action. When performance measurement information is not institutionalized in an organization's operation, its commitment might be affected due to conflicting priorities. In sum, organizational culture should not only promote attitudes in favor of the use of performance information, but also promote process of decision-making that intuitively and enduringly incorporate the use of such system. Organizational culture must promote the knowledge and the benefits of performance system to overcome the fear that may exist.

## Conclusions

Barriers to the development and adoption of performance systems can be categorized into three dimensions: (1) capacity limitations, (2) knowledge limitations, and (3) buy-in limitations. These factors are often time interrelated. For instance, a culture that welcomes change and innovation can promote managers to allocate adequate resources and to sponsor supportive managerial practices and employees' training. On the contrary, the lack of support from lower management can obstruct the practice of collecting and analyzing data. Similarly, inadequate technical capacity may lead to negative user experience, thus, reduce people's confidence in using result-based information. Responses to these issues can be distilled into a few core recommendations. Having a dedicated data analyst for the performance system can prevent burdening existing staff and help the system achieve a scalable state. Relying on out-o-the-box software systems that come with "predesigned" measures can miss the nuances of your programs. Regular discussion of performance information will help engrain these practices into the culture of the organization. Relying too heavily on proxy/indirect measures and benchmarking can reduce confidence in the system's results. Significant time and effort should focus on the question "does this indicator really measure what we want it to?"

## Synonyms

Systemic approach to public administration

## Definition

The systemic approach to public administration provides the grounds for a consistent and rigorous approach to an ideal model of public administration that sums up all the advantages – desires for any administration to incorporate, i.e., nationality, efficiency, optimal service to citizens, and so on (Alexandru 1996, p. 140).

## Introduction

In recent decades, there have been more and more important concerns of researchers and specialists, politicians or government officials, regarding the development of public administration models.

This entry aims to advocate in favor of the need to apply systemic analysis as a research method of the administrative phenomena and processes. As Professor I. Alexandru (2000) points out, "in order to specify the role of public administration in the rule of law, a more comprehensive systemic analysis is required, which – going beyond structural and functional analysis – aims to study the relationships between system elements, as well as between the system elements and its whole and the other elements of the social system. In this way it is possible to distinguish between the internal relations of the system (which are considered relatively stable, being enshrined, especially in legal norms) and the relations of the system with the social environment" (Alexandru 2000, p. 21). The entry is structured in three parts.

The first part scrutinizes the origins of systemism but also the precepts of systemic thinking. The second part of the entry reveals the arguments regarding the need for a systemic approach to public administration. The third part of the entry focuses on the subsystem of public administration – subsystem of the global social system.

The entry ends with a couple of brief conclusions.

## The Origins of Systemism and the Precepts of Systemic Thinking

The need for a general theory of systems is supported by the level reached by a series of branches of science but also by the possibility of unitary and modern approach to some classic controversies in the biological sciences, of its social behavior.

Until recently, the only reality that mattered was the physical one. The study of metaphysics has opened new horizons, and, over time, biology and the social sciences have come into their own. Under this framework, a generalization of scientific concepts and models has become necessary also triggered by the emergence of new disciplines in the traditional system of physics. One can also discuss the existence of a traditional approach that did not include concepts such as the organizational or teleological one. Anything that did not rely on classical principles was considered illusory, metaphysical (Bertalanffy 1993, p. 91).

Classical sciences would use models consisting of two variables, linear causal chains and a cause-effect, and sometimes models with several variables.

The general theory of systems is founded on new generalized concepts, based on the interdisciplinary approach, and integrates, in a modern way of thinking, branches and chapters of the relevant science. Among these, we list:

- Cybernetics, based on the principle of feedback, of the circular causal chains, in which the mechanisms follow a behavior focused on self-regulation.
- Information theory, which introduced the concept of quantifiable information through an isomorphic expression of negative entropy from physics and which develops the principles of information transmission.
- Game theory analyzes, in an original mathematical form, the rational competition, for a maximum gain or a minimum loss, between two or more opponents.
- Decision theory also looks into the rational ways of human organizing based on the examination of a given situation and its possible consequences.
- Topology, or the mathematics of relations, which considers nonmetric fields such as networks and graph theory.
- Factor analysis that, with the help of mathematical analysis, highlights factors in phenomena with several variables, such as those in psychology or in other fields.

The general theory of systems acquires the characteristics of a fundamental science; its correlates belong to the applied science, being sometimes known as the general science of systems.

The following areas can be distinguished in its evolution (Ackoff 1960, pp. 1–8):

- Systems technology, i.e., scientific training, scheme, evaluation, and construction of "human-machine" systems; this field relies mainly on cybernetics and information theory.
- Operational research, which involves scientific control of existing systems: human, machine, material, and financial systems. The tools used are linear programming and game theory.
- Human technique, which is equivalent to the scientific adaptation of systems to achieve maximum efficiency with a minimum cost in monetary or other factors.

The human technique, which deals with the capacity, the limits of psychology, and the inconstancy of the human being, uses among its tools biomechanics, psychological techniques, human factors, etc.

Studying the general theory of systems as a science marks a distinct stage in the evolution of a true current in scientific thinking: systemism or systemic thinking.

Systemism is a methodological approach to human knowledge, which includes theoretical and practical activity. Its evolution bears the imprint of overall scientific development, being forced, over time, to adapt its theoretical grounds, constantly approaching and becoming a scientific theory. The origins of systemism are found in ancient Greek philosophy, when the concept of system appeared in an embryonic form. We owe this to Aristotle, who gave the first definition of the notion of system, stating that "the whole is greater than the sum of the parts." Even if the precepts of Cartesian knowledge have become sophistry today, they need to be highlighted from the perspective of scientific rigor and the depth of knowledge, so necessary for the systemic approach (Niculescu and Lavalette 1999, pp. 307–308).

To rightly conducting his reason and seeking truth in the sciences, René Descartes founded the *Discourse on the Method* in 1637, which was the paradigm for much research before the systems approach, allowing former researchers to study the phenomena and the problems. This is known by the Cartesianism, since it is attributed to the philosophy and reasoning of Descartes.

The four precepts of the *Discourse on the Method* of René Descartes are as follows:

- The first was never to accept anything for true which I did not clearly know to be such, that is to say carefully, to avoid precipitancy and prejudice and to comprise nothing more in my judgment than what was presented to my mind so clearly and distinctly as to exclude all ground of doubt (Descartes and Veitch 2012).
- The second, to divide each of the difficulties under examination into as many parts as possible and as might be necessary for its adequate solution (Descartes and Veitch 2012).
- The third, to conduct my thoughts in such order that, by commencing with objects the simplest and easiest to know, I might ascend little by little and, as it were, step by step to the knowledge of the more complex, assigning in thought a certain order even to those objects which in their own nature do not stand in a relation of antecedence and sequence (Descartes and Veitch 2012).
- And, last, in every case to make enumerations so complete, and reviews so general, that I might be assured that nothing was omitted (Descartes and Veitch 2012).

To fully understand the principles of the Cartesian discourse, according to the Descartes' own words, "The long chains of simple and easy reasoning by means of which geometers are accustomed to reach the conclusions of their most difficult demonstrations, had led me to imagine that all things, to the knowledge of which man is competent, are mutually connected in the same way, and that there is nothing so far removed from us as to be beyond our reach, or so hidden that we cannot discover it, provided only we abstain from accepting the false for the true, and always preserve in our thoughts the order necessary for the deduction of one truth from another" (Descartes and Veitch 2012).

Recognizing the value of experimental knowledge, Descartes' precepts substantiate the systemic approach as a method of general theory of systems.

With a concept different to the Cartesian one, the French sociologist Claude Levi-Strauss explains the complex social structures by their dual, contradictory organization. The social community is conceived as a system divided into two halves, associated and opposed at the same time. Promoter of structural analysis, Claude Levi-Strauss states in *Structural Anthropology*: "No science today can consider structures arising from its field as being reduced to any arrangement by any party."

The reciprocal interaction between the human system and the environment is also present in Jean Piaget's scientific work. Using experimental research, Jean Piaget developed an original theory of the genesis and mechanisms of thought, called operational theory. Concerned with issues of psychology, biology, logic, and philosophy, Piaget argues that "any relationship between a living being and its environment has the specific character that the former, instead of being passively subjected to the latter, modifies it, imposing on it a certain structure of its own" (Piaget 1947, p. 31). A similar conception is promoted by the French geneticist François Jacob in *La Logique du vivant*, namely, "Every living organism is the result of the close interaction of the genetic program contained in its chromosomes and the environment." Elements of systemic thinking can also be found in the works of the Austrian philosopher and logician Karl Raimund Popper. He explains his thesis on objective knowledge through the existence of a third real world, which contains stories, explanatory myths, scientific theories, etc. This exerts an essential retroaction on the second world, of conscious or unconscious processes, and also, through the latter, on the first world, that of physical entities built by man. Worlds represent systems or subsystems on the interaction of which the construction of scientific theories is based. Promoter of the so-called hypothetical-deductive model, Popper bases his approach on the science of strictly deductive procedures, rejecting the method of induction. The concepts presented here, in an extremely succinct manner, underline and highlight the presence of the systemic approach in the work of renowned scientists in various fields of science. Of course, the analysis can continue, thus foreshadowing the trend of thought that systemism represents today.

In its evolution, systemism comprised two important phases. The first phase coincides with a so-called construction of the restricted theory of systems based on traditional knowledge of physics, mechanics, etc. The contributions of the thinkers of this period are subsumed to the development of the sciences or fields in which they manifested themselves. The second phase appears as a natural stage in a comprehensive evolution of systems theory in consensus with the general development of human knowledge. The beginnings of this stage correspond to the elaboration, in the middle of the twentieth century, by the Austrian biologist Ludwig von Bertalanffy, of a generalized conception of systems, known as the "general theory of systems."

General theory of systems is a program of research and direction in the philosophy of contemporary science, which aims to integrate different areas of knowledge with the help of a unified conceptualization and research methodology. Many representatives of the international scientific community have joined Bertalanffy's efforts. Among them, Jean-Louis Le Moigne deserves a special attention. He formulated the new precepts of systemic thinking consonant with T.G.S (Le Moigne 1977):

- The precept of relevance (the opposite of the Cartesian precept of evidence): Agreeing that any object we consider is defined in relation to the implicit or explicit intentions of the modeler. Never refrain from questioning this definition; if our intentions change, our perception of this object changes.
- The precept of globalism (the opposite of the Cartesian reductionist precept): Always consider the object to be known by our intelligence as an immersed and active part within a larger whole. To perceive it first globally, in its functional relationship with its environment without unduly sourcing to establish a faithful

image of its internal structure, whose existence and uniqueness will never be taken for granted.

- The precept of teleology or finality (the opposite of the Cartesian precept of causality): Interpreting the object not in itself, but by its behavior, without seeking to explain this behavior a priori by some law implied in a new structure. On the other hand, understand this behavior and the resources it mobilizes in relation to the projects that, freely, the modeler attributes to the object. Take the identification of these hypothetical projects for a rational act of intelligence and agree that their demonstration will very rarely be possible.
- The precept of aggregation (the opposite of the Cartesian precept of exhaustiveness): Agree that any representation is partisan, not by forgetting the modeler, but deliberately. Consequently, look for a few likely to guide the selection of aggregates considered to be relevant and exclude illusory objectivity from an exhaustive inventory of the elements to be considered.

## The Need for a Systemic Approach to Public Administration

The systemic approach of public administration offers the foundation of a consistent and rigorous approach for an ideal model of public administration that sums up all the advantages – desired for any administration, i.e., nationality, efficiency, optimal service of citizens, etc. (Alexandru 1996, p. 140).

In this entry, we will try to argue in support of the need to apply systemic analysis as a method of research of the administrative phenomena and processes. We will understand public administration as "that activity which consists mainly in organizing and ensuring the execution, but also in the direct implementation of the Constitution provisions, of all normative acts and of other legal acts issued by the authorities of the rule of law" (Negoita 1966, p. 21).

But, as Alexandru (2000) points out, "in order to specify the role of public administration in the conditions of the rule of law, a systemic analysis is needed, more comprehensive, which – beyond structural and functional analysis – aims to study the relationships between system elements and between these and the whole and the other elements of the social system. In this way it is possible to distinguish between the internal relations of the system (which are considered relatively stable, being enshrined, especially in legal norms) and the relations of the system with the social environment" (Alexandru 2000, p. 21).

The argument backing the need for a systemic approach to public administration is briefly presented in a series of recent studies belonging to well-known and recognized personalities in the field. Among them, we look into the work of the Greek professor J. M. Decleris *The Theory of Systems of Public Administration: The Main Problems* (Decleris 1992, pp. 149–153).

Decleris' conception reveals the following:

- A comprehensive theory of systems is extremely necessary in public administration. While private and nonprofit organizations were eager to receive and even experiment with general theory of systems, the public administration showed only a partial interest in it, by adopting and adapting to the real needs of systemic method and technique analysis, especially information management systems, decision support systems, policy analysis, evaluation methods, etc.

  It is noteworthy that this partial reception of the systemic approach took place in countries with a moderate tradition in public administration, such as the Anglo-Saxon ones, while the countries of the continent remained strongly attached to culture versus the "administrative law." Such a development at the time gave the impression that it was a matter of "general theory of systems" versus "administrative law," but the recent French "administrative renewal" (started in 1989) and the First Greek Program of Administrative Reform (1992) managed to convince that the systems approach was not incompatible with "administrative law."

- In fact, systemic analysis is very necessary in public administration due to the increasing complexity of public problems. Given their magnitude, the current public problems seem difficult at the moment, and many people speak of a new era of "ungovernability" and chaos or at least a persistent "adversity."

  However, this is not the case. The present uncertainty and confusion should not be attributed to a significant delay in the systematization of public administration. Complexity can be conquered by complexity, and systems theory is the only answer to the question: how can modern public administration live up to the expectations of service users?

  It is not an issue of reducing the areas of state activities, as some economists have considered, but it is an issue related to the improvement of administrative services with the help of systems science and technological innovations, i.e., information technologies.
- Referring to the problem of the "model" of public administration, Decleris (1992) considers that: "a valuable science of systems, which deserves its name, for public administration must start with a satisfactory system model thereof.

  We need to identify public administration in the broader system of government, known as the 'state' in the dictionary. This allows us to outline the boundaries of public administration and to describe its connections with the other subsystems of the state" (Decleris 1992, p. 149).

Such a model was proposed by Decleris (1986). According to this model, the public administration is the most important processor of value demands (inputs) in the system of government, demands that vary in relation to social complexity.

Such value demands are generated by public issues, and their processing is a type of conversion in quantity and/or quality through a series of public decisions.

In this series of decisions, which belong to the various components of the governance system, the decisions belonging to the public processor refer fundamentally to the implementation phase, which involves the development of small-scale policy and discretionary power.

However, the system model clearly shows the impact of public administration on the programming of processed applications, hence the interdependence of public policy development and implementation processes.

This fundamental observation offers the modern significance of the separation of powers in the state and reveals the importance of bureaucratic administration in complex societies.

Equally important are the interactions of the public administration with the Filter and Control components, verified by the media, interest groups (Filter), and the courts throughout the entire policymaking process (Fig. 1).

This basic model of public administration must be accompanied by a detailed model evincing:

**Systemics of Public Administration, Fig. 1** Decleris systemic model of public administration. (Source: Matei 2000)

a. Its internal structure
b. The network of public policies, which are the object of a specific administration.
c. Both models can vary in space or time and are now in a continuous process of administrative reform.
   - For the design of the detailed structural models of a specific administration, the conclusions of the organizational theory can be taken into account. Decleris draws attention that "we must keep in mind that, although some organizational principles are valid in public administration, it is an organization with its own emerging qualities in which the pursuit of the public interest through appropriate means and procedures is the most important quality" (Decleris 1992, p. 150).

Other important emerging qualities of public administration are considered to be hierarchy and continuity.

The structural system models of the public administration must reflect its qualities. However, the integrity of the public administrative model is still lacking.

Existing structures have developed over the centuries in an empirical and fragmented way, and their totality is far from being a model for a national and coherent system of action.

Reform is needed not only in spatial systems (e.g., deconcentration) but also in the design and coordination of many public administration structures, mechanisms, and institutions, given the wide communication potential offered by information technology.

The present administrative structures are so numerous and large that only a system model can help to order the total conglomerate.

- The second category of systemic models required in public administration must be defined as functional, a term that refers to the aims and objectives of public policy development. In systems logic, functional models precede structural ones, which are designed only after functional ones are established.

The basic network of public policies to be implemented by the public administration is such a predominant functional model and aims to clarify the interrelationships between these policies.

The reality confirms that very few public administrations have an overview of their activities, translated into a meaningful model.

Consequently, few governments have a coherent idea of the real impact of their policies on society. Under such conditions, no effective control is operable.

Decleris (1991) proposed a simplified model of public policy, based on a seven-component system that includes:

- Value system (human rights policies, against crime, in favor of the arts, etc.)
- Social communication (education, science, research and technology policies, media, etc.)
- Social hierarchy (social policy, health, housing, etc.)
- Governance (state organization, budgetary and fiscal policy, administration reform, etc.)
- Environmental control (environmental policy, agricultural management, urban and regional planning, sustainable development, economic policy, etc.)
- Affective systems (family policy, ethnic policies, etc.)
- Personality (individual freedom, creativity, etc.)
- The third area of analysis of public administration systems refers to the procedural and methodological aspects of public policymaking. The "administrative codes" and the "administrative procedure," which establish the legal framework for the protection of citizens, are now complemented by policy analyses, forecasting and evaluation techniques, cost-benefit analyses, and a set of methods and techniques applied, centered on the concept of system, which aim to ensure effectiveness and efficiency in administrative action.

In this way, a scientific governance is achieved: public policies are no longer just the result of improvised compromises; they

tend to become the result of an elaborate systemic design.

- Systemic methods and techniques, based on the application of public law principles in the design and implementation of public policies, are now proliferating rapidly. "Public management" is a fashionable term now, which suggests a declared merger of public administration with management. It is a preferred alternative to the proclaimed uniqueness of management in all types of organizations. Again, the emerging qualities of the public administration system should not be overlooked in any policy model. In many cases, effectiveness in administrative action was ensured with coercion from the ruling power. This is no longer valid. Coercion remains the last argument of state action; the authority on public policymaking increasingly depends on rationality and net results.

Systemic methods and techniques are important because they tend to:

- Ensure the participation of citizens in the elaboration of public policies and their observance.
- Produce the desired results.
- Reduce the social cost of any policy (Decleris 1989, p. 89).
- Communication and information processing is the fourth area of public administration in which the science of systems is useful.

Due to their complexity, solving public problems requires the processing of huge amounts of information, otherwise impossible without technological support.

The contribution of systems science resides in software engineering, where a variety of programs are designed to rigorously handle impressive volumes of information. These represent something more than the successful dealing with quantity; it means that rationality and control in public policymaking are also effectively served. It is a rapidly evolving field of knowledge: from information management systems to decision support systems and beyond to expert systems and new neural networks – all these powerful means of support are available to decision-makers in public organizations.

A significant part of the problem-solving routine has been taken over by machines, while other smart equipment can enhance the creativity of public managers.

No matter how elaborate, systems models in public administration ultimately refer to the analysis of human beings, which by definition and due to their inherent autonomy have poor controllability, compared to man-made machines.

In order to activate any organization, not only the structure and activities of such a system should be rationally designed, but human action should also be involved.

Apparently, this was obvious in the past, and the public administration was content to develop civil servant codes that incorporated a rudimentary system of rewards and sanctions.

In today's society, more complex ways of human cooperation are being sought, and a true science of behavioral control systems is needed.

Cybernetics is an integral part of systems science and is extremely timely, a fruitful use of its principles. Currently, human resource management is based on a body of knowledge, borrowed from the social sciences, psychology, being supplemented by common sense recipes to ensure motivation, productivity, and leadership.

The task of systems science is to develop a coherent theory of behavioral control systems that has an applied character.

Public administration is the largest employer, and millions of people spend much of their lives in its many organizations. Life in public organizations and the relationships with the general public must be seriously studied before prescribing patterns of human behavior in the organization.

The fields with special preoccupations in the public administration refer not only to the maintenance of the authority relations in the society but also to the intelligent motivation of the performance of the public agencies.

Given the ubiquity of conflict, in and out of public administration, systemic models for conflict negotiation and management must be a priority for system designers and analysts.

Decleris has outlined the areas toward which the systemic approach must be oriented, so that a systemic model of public administration can be designed to provide the fundamentals for better governance in any society.

## Public Administration, Global Social System Subsystem

The public administration can be considered a subsystem of the global social system.

The environment of the public administration subsystem consists of the other subsystems of the global social system, of which we can list:

- The political subsystem
- The economic subsystem
- The legal-normative subsystem (Matei 2000, p. 131)

We can state that the public administration subsystem is a cyber-system with the following characteristics:

- It is an open system due to the fact that it has connections (inputs/outputs) with other systems and with its environment.
- It is a dynamic system because it evolves over time, changing its state, structure, and/or behavior as a result of internal or external causes.
- It is a complex system – understanding this in terms of dimensions, number of connections between elements, and the presence of the human element.
- It is a self-adjusting system – because it has the ability to react to the action of internal and external factors and to maintain control over different periods of time (Matei 2000, p. 93).

The inputs of the public administration system represent a consequence of its connections with its environment. These relate to the transfer from the environment or other subsystems of:

- Material resources:
  - Immovable and movable property
- Financial resources:
  - Taxes, duties, and in some cases donations and sponsorships
- Human resources:
  - Civil servants, contract staff, and elected positions

It is unanimously acknowledged that the value of an administration lies not so much in the material or financial means at its disposal but especially in its human potential (Alexandru et al. 2002).

The consequences of inputs can be highlighted by reducing the entropy of the system but also by disturbances in the system that can cause dysfunction and even disorganization.

The internal measures taken to protect the system from such possible disturbances lead to a process of filtering the inputs, and as a result the cybernetic-administrative systems can be considered semi-open systems:

- Information resources:
  - Information and information technologies
  - Decisions
  - Laws and other normative acts

The outputs of the public administration system ensure the transfer to the environment or other systems (subsystems) of:

- Material resources (public parks, road and railway infrastructure, etc.)
- Human resources
- Public services
- Information
- Action programs
- Own decisions, materialize in administrative deeds and contracts

The effects of the outputs on the public administration system are diverse, and sometimes even contradictory, as they can contribute to the increase/decrease of the system entropy as well as to the reduction/increase of the degree of organization and complexity.

These seemingly opposite effects are explained by the system connections.

For example, the simple reduction of staff can lead to an increase in the entropy of the system, but if this is accompanied by the implementation of modern information and communication technologies, the effect can be the opposite (Matei 2000, p. 93).

## Conclusions

In conclusion, we can state that the systemic approach of public administration has proved very useful in solving complex issues related to people and the socioeconomic environment.

Systemic analysis makes it possible that the effects of some changes are modeled and anticipated, given that this method involves performing a very detailed analysis of the system elements/components.

# Systems and Complexity Theories of Organizations

Francis Amagoh
Department of Public Administration, KIMEP University, Almaty, Kazakhstan

## Synonyms

Complexity theory; Organizational change; Organizational competitiveness; Organizational theory; Systems theory

## Definition

Systems theory focuses on structures, relationships, and interdependence between elements, while complexity theory refers to the heterogeneity in the various subsystems of an organization and how parts at a sublevel in a complex system affects the emergent behavior and outcome of the system.

## Introduction

Systems and complexity theories are theories of organizational change processes that seek to explain how organizations operate and sustain

themselves with their environments. General systems theory (GST) originated from the fields of biology, economics, and engineering and explores principles and laws that can be generalized across various systems. GST was first introduced by Ludwig von Bertalanffy in 1940 but only gained prominence in the 1960s (Bui and Baruch 2010). GST is primarily concerned with how systems operate and integrates a broad range of systems by naming and identifying patterns and processes common to all systems (Ceric 2015; Bausch 2002). Theoretically, a system is considered to have subsystems (or elements), whose interrelationships and interdependence move toward equilibrium within the system. The behavior of each subsystem has an effect on the behavior of the system; the behavior of the subsystems and their effects on the system are interdependent, and while the subsystems all have an effect on the behavior of the system, none has an independent effect on it (Skyttner 1996; Bui and Baruch 2010). Thus, according to Katz and Kahn (1978), the concept of systems theory can be summarized as a knowledge framework that focuses on structures, relationships, and interdependence between elements.

Aside from Ludwig von Bertalanffy, other pioneers in the field of GST include Kenneth Boulding, Daniel Katz, and Robert Kahn. In Boulding's view, GST studies all thinkable relationships abstracted from any situation or body of empirical knowledge (Boulding 1956). In his hierarchical framework of systems, Boulding arranged systems in order of their complexity (Veetil and Wagner 2015; Bausch 2002) and classified them into nine levels according to increasing levels of complexity (Ferreira 2014; Yoon and Kuchinke 2005). The hierarchical framework of systems was developed by Boulding for the purpose of studying systems' characteristics. The nine levels of the hierarchical framework of systems are as follows:

1. Static structure: This might be called the level of "frameworks." It is referred to as the geography and anatomy of the system (basically, it is the identification and relationship of parts).
2. Simple dynamic: Basic motions of the system within its environment (movement of parts).
3. Self-regulated: The concept of control as a system (the idea of the thermostat).
4. Open: The system is regarded as a cell (it is the self-maintenance factor in living systems).
5. Genetic-societal: This refers to the plant as a system (it is the predetermined patterns of growth and decay).
6. Animal: Animals are regarded as systems (increased mobility and self-awareness).
7. Human: The individual as a system (there is self-consciousness, learning, adaptation).
8. Social: The group or organization as a system (there are roles, perceptions, status, etc.)
9. Transcendental: This level consists of absolutes and ultimates (i.e., the unknowns) (Amagoh 2008; Martinelli 2001).

In addition, Boulding synthesized the GST frameworks into five categories as follows:

1. Order, regularity, and nonrandomness are better than disorder, irregularity, and lack of randomness.
2. Orderliness in the empirical world makes the world good, interesting, and attractive to systems theorists.
3. There is order in the orderliness of the external world (order to the second degree), a law about laws.
4. To establish order, quantification and the mathematicians are of high importance.
5. The search for order and law leads to the quest for the empirical referents of this order and law (Amagoh 2008; Sullivan 2004).

## Systems Theory and Organizations

Human organizations are considered as organic systems in which everything is related to everything else, and a change in one element of the system affects all other relationships in the system (Moeller and Valentinov 2012). Thus, any change in any elements of the system causes changes in other elements (Stewart and Ayres 2001).

An important aspect of GST is that it distinguishes between open and closed systems. While the closed systems approach consider the organization's interaction with the external environment to be irrelevant, in open systems the organizations' interaction with the external environment is important for organizational survival. The lack of coordination between the organization and its external environment in closed systems inhibit the organization's capacity to import sufficient energy from its environment for sustenance (Amagoh 2008).

Katz and Kahn (1966) identify the following nine characteristics of open systems as applied to organizations:

1. Open systems import energy from the external environment.
2. Open systems transform energy that is available to them.
3. Open systems export some products into the environment.
4. The pattern of activities of the energy exchange in open systems is cyclical in nature.
5. To survive, open systems must move to arrest the entropic process; they must acquire negative entropy.
6. All inputs are informative in character and provide signals to the structure of the systems about its own functioning in relation to the environment. Thus, negative information enables the system to correct its deviation from course. The nature of the functions performed by the system determines its coding mechanism, which in turn perpetuates this type of functioning.
7. The importation of energy to arrest entropy operates to maintain some consistency in energy exchange, so that the open systems that survive are characterized by a steady state.
8. Open systems move in the direction of differentiation and elaboration.
9. A system can reach the same final state from differing initial conditions and by a variety of paths (equifinality) (Katz and Kahn 1966; Amagoh 2008).

In open systems, the cycles of inputs, throughput, and output, which constitute organizational systems and subsystems, are carefully examined. Thus, organizational performance is best understood in terms of the entire system and management's ability to control the environment (i.e., balance resources) (Martz 2013). According to Katz and Kahn (1978), organizations are comprised of patterns of events which are interdependent, cyclical, consistent over time, and must therefore be understood in terms of their interaction with each other and with the external environment. Organizations exist in a turbulent environment characterized by increasing uncertainties taking place in the political and economic environment as well as changes in technology.

Organizations are affected by the industry in which they operate and other factors in the external environment. Thus, viewing an organization as an open system helps to better understand how it can better obtain resources such as raw materials and information, transform the resources by making better use of its social and technological components, and produce the best results. It is important to note that in open-systems theory, it is assumed that boundaries between organizations' input and output are distinct. As a result, the goal of transformation is to improve the horizontal and vertical fit between the subsystems within the organization and the fit between the overall organization design and its external environment. The open system model stresses the complexity and variability of the individual parts of the organization such as individual participants and subgroups and the looseness of connections among them. Thus, the survival of the organization depends on detecting the environment and adjusting itself to the changes taking place in the environment (Veetil and Wagner 2015).

## Critique of Systems Theory

Systems theory is not without its critics. According to Yoon and Kuchinke (2005), while the systems model talks about the input-throughput-output process, it fails to indicate when and how collaboration within the organization can address urgent issues. Further, the

systems model does not suggest what to do when there are existing or potential conflicts within or between organizational environments (Amagoh 2008; Veetil and Wagner 2015).

Second, it is difficult sometimes to differentiate boundaries and transformation when organizations have multiple nodes of interactions and communication lines. Thus, when the environment rapidly changes and tasks and group compositions become intermingled, the systems mode may be inadequate to provide answers on how organizations can address such complex situations (Martz 2013).

Third, when it comes to policy priorities, the systems model gives little guidance as to which aspects of the system should be manipulated to achieve policy objectives. In other words, it fails to provide a way forward when constituents of a system are in conflict with each other (Visser and Togt 2016; Stewart and Ayres 2001). Fourth, Kast and Rosenzweig (1973) cautions against the idea of comparing organizations to organisms too literally since while organizations may be considered as systems, they are not necessarily natural systems.

Finally, according to Martz (2013), a focus on maximizing the efficiency of subsystems may restrict the organization's ability to adapt to change. The emphasis on greater efficiency without consideration of organizational survival may lead to a myopic organization whose highly efficient system may become irrelevant to the long-run demands of the marketplace. Thus, an organization may be considered a high performer in the short run (i.e., the subsystems are optimized) even when it does not possess a comparative advantage in the long run. These criticisms of the systems model have led to a model of organizational change derived from the ideas of dynamic nonlinear systems. The complexities and uncertainties in organizational change processes seem to be better reflected in complexity theory of organizations.

## Complexity Theory

Complexity theory focuses on the heterogeneity or diversity in the various subsystems of an organization (such as customers, suppliers, socio-politics, technology, etc.) (Meek et al. 2007). It tries to explain how parts at a sublevel in a complex system affect the emergent behavior and outcome of the system (McKenzie and James 2004; Foster 2005). According to Ferreira (2014) a system should be considered complex when it is made of groups of elements with different functions and behaviors are in constant evolution and are influenced by events that cannot be foreseen with certainty. The information about the state of these elements cannot be completely known, and the elements are related by a great variety of interrelationships.

According to complexity theory, the most creative phase of a system lies between order and chaos. Complex systems evolve through phases of instability until they reach a stage where equilibrium is reached between the organization and its environments and itself (Sullivan 2004; Guevara and Posch 2015). According to complexity theory, systems that operate around the edge of instability (also called "the edge of chaos") tend to exhibit creativity and produce new and innovative behaviors (Price 2004). Thus, in the complexity paradigm systems are always evolving or self-organizing into something new (Ferlie 2007; Kuhn et al. 2015).

Complexity theory uses the concept of entropy, which is the ability of a system to move toward a chaotic or random state where there is no further potential for energy transformation (Byeon 2005; Farazmand 2003; Guevara and Posch 2015). Entropy is the disorder or randomness in a system. Thus, entropy (in complexity theory) has replaced the age of equilibrium (in systems theory). The theory is therefore regarded to better fully capture the uncertainties and complexities inherent in social phenomenon. This is in contrast to systems theory which focuses solely on the idea of equilibrium in social systems (Meek et al. 2007; Byeon 2005; Wallis 2013).

## Characteristics of Complex Systems

Complexity theory regards social systems as complex based on certain characteristics. First,

complex systems are characterized by non-linearity and feedback, which usually results in feedback mechanisms (Sherif 2006; Kuhn et al. 2015). Complex systems are structurally based on a feedback concept, which states that our current actions define future situations. According to Kuhn et al. (2015), actions change the state of the system and people react to reestablish the equilibrium. Positive feedback typically generates growth in the system, while negative feedback does the opposite, searching for balance. However, structures that mix both types generate diverse behavior.

Second, complex systems are dissipative structures. This means that they do not correspond to external pressures in a linear manner (Styhre 2002; Wallis 2013) and are far from equilibrium. The organization experiences fluxes in its environment, and these constitute issues that it needs to address. As the intensity of the fluxes in organizational environment increase, the system is moved far away from equilibrium towards the crisis stage. At the crisis stage, the organization's structure holds the organization together and dissipates the "fluxes of energy" coming into it (Paraskevas 2006; Foster 2005). For example, when a system operates outside of established rules or outside of the usual ways of working, it may arrive at a critical point and deteriorate to disorder or create some new order and organization. The organization may also be in a state which is neither stable nor instable but both simultaneously. In this state, there is instability because specific behavior is not predictable in the long term, but there is stability in the qualitative structure to this behavior and short-term results are predictable (Visser and Togt 2016).

Third, complex systems have the ability for self-organization and adaptation. This is called auto-organization, which is the spontaneous union of a group to accomplish a task. Because of the interactions between various parts of the system, parts of the system can self-organize rather than being subdued by a central control. Adaptation is the behaviors which allow the system to survive changes in its environment. It is the ability of the system to modify itself to environmental disturbances that threaten the system's efficiency. In complex systems, the concept of feedback mechanisms is one of the major elements that make self-organizing systems effective (McKenzie and James 2004; Wallis 2013).

Fourth, complex systems have the characteristics of connectivity and interdependence. This means that one element (or group) decision or action may affect related elements and systems. The degree of connectivity and interdependence between the elements of a complex system determines the level of relationships and transfer of information in the feedback process. According to Schwandt and Szabla (2013), the concept of coevolution comes from the mutual influence between the elements of the system. Coevolution emphasizes the relationship among the entities that coevolve (Kuhn et al. 2015).

Finally, complex systems exhibit emergent properties whereby patterns emerge which are due to the collective behavior of the system's components. The emergent properties are independently observable and empirically verifiable patterns (Ferlie 2007) and happen when the system is heading towards disorder. The disorder/crisis draws the organization in a particular direction (Price 2004; Foster 2005) and triggers changes in the organization. This is the stage where the organization reaches the threshold of "phase transition" (Paraskevas 2006). At the phase transition stage, the system may either break down leading to the demise of the organization or break through to one of several new states which will emerge from the self-organization of the organization's components. The experience of the organization from the crisis will become part of its organizational learning and consequently will influence its behaviors in the future (Paraskevas 2006; Kuhn et al. 2015).

## Organization as Complex Adaptive Systems

Systems that import information from the environment and produces stores of knowledge that can aid action are called "complex adaptive systems" (Price 2004). Organizations are complex systems because they consist of autonomous

entities that are interconnected in different ways and at different intensities (Martz 2013; Kuhn et al. 2015). These entities are self-organizing and self-generating entities and their behavior emerges because of the nonlinearity of the feedback structures. The structures also coevolve with the environment and have the potential to generate a new order after periods of instability. Unlike living beings, which are born with a structure and maintain it until the end of their life cycle, organizational structures can be renewed or altered. Thus, the growth pattern is within the organizational attractor of possibilities or within a certain level of complexity. When the threshold limit is reached, the organization has the ability to adapt by choosing a new structural (or cognitive) configuration that is appropriate for the new level of complexity (Guevara and Posch 2015).

Organizations experience periods of instability from time to time when it reaches its limit of complexity. In periods of relative stability, changes need to be made to preserve the organization against internal and external disturbances. However, over time if the changes are not made, the fundamental structure of the system will collapse because, according Schwandt and Szabla (2013), informal systems move the organization to a fragmented and disordered state. Some of the characteristics of the organization at this stage are of cultural diversity, conflict, weakly shared vision, ambiguity: all elements belonging to the cognitive subsystem. A system is considered mature when it adapts to the demands of its environment with a high enough level of complexity for its survival. The organization that is capable of doing what must be done to survive in its environment very well is considered a mature organization. When environments are volatile, organizations run the risk of becoming too rigid for future changes by trying to stabilize at a moment. Investigating how self-organization occurs in a given setting is key for the success of complex nonlinear systems. Thus, organizational learning and all forms of innovation tend to occur in organizations where there are interactions between their various adaptive parts (Foster 2005).

## Conclusion

System and complexity theories have contributed to recognition of the roles of individuals and subunits in the survival of organizations. As the subunits in an organization interact with each other and the outside environment, such interactions will cause the system and the environments to become more complex (Bui and Baruch 2010). Thus, improved understanding of a system by identifying the interactions between individuals and the various subunits in organizations will help managers find strategies to address complex situations. Systems and complexity theories have implications for organizational learning through the interactions of the subunits and the environment in responding to chaotic or complex situations. Systems and complexity theories are also important for strategy development because they can help managers understand the interactions between diverse subunits of an organization and the external environment. Such an understanding will help managers take a long-term view of the organization.

When organizations use subsystems, such as work groups or key individual performers as responses to rapid changes in the environment, complexity theory provides conceptual foundations for managers to prioritize system performance levels and examine how they proactively and collectively seek to solve and adapt solutions that will suit organizational strategy (Martz 2013; Schwandt and Szabla 2013). Changes in the external environment can lead to turbulence in the organization. To survive in a competitive environment, organizations have to adapt by changing their internal structures and processes. This can lead to organizational learning and enhance the long-term survival and competitive advantage.

### Introduction

Democracy is an institutional arrangement that allows the people of a state to participate in political decisions through their voting power (Schumpeter 1942). Ideally, democracy is a process that guarantees civil rights to the citizens of a state, including freedom of expression and the right to private property (Rao 1984). It makes a government more transparent and accountable, leading to higher levels of public sector capacity and increased demand for public participation, redistribution, and provision of public goods. Hence, democracy should have a positive effect on macroeconomic activities, including economic growth and tax revenue. However, two competing theories predict different impacts of democracy on economic activities: the compatibility perspective and the conflict perspective. While the former considers that democracy facilitates economic growth, the latter proposes that democracy harms economic activities. These two theories allow one to compare the relationship between democracy and tax collections within the context of governments in developing countries versus developed countries (Rashid et al. 2020).

According to the compatibility perspective, democracy facilitates economic growth and promotes business investments because it protects civil liberties and basic freedoms and it increases free and fair political participation (Baum and

Lake 2003; Sirowy and Inkeles 1990). Tax collection is a part of macroeconomic regulatory activity that supports public expenditure, and democracy helps economic institutions in a country to achieve public policy objectives such as collecting tax revenue. Consistent with the compatibility perspective, democracy may have a positive impact on tax revenues, especially in developed countries that have mature economic institutions (Rashid et al. 2020).

On the other hand, the conflict perspective posits that democracy allows interest groups in a society to increase rent-seeking activities by means that include corruption and bribery. It also posits that governments allowing more political freedom are less effective at regulation (Baum and Lake 2003). These predictions are more applicable to developing countries where prevailing economic, legal, social, and institutional safeguards are weak. Consistent with the conflict perspective, Rashid et al. (2020) find that democracy has a weaker and, in some cases, even a negative relationship with various categories of tax revenue in developing countries when compared to developed countries.

There are four common categories of tax revenue: personal, corporate, indirect, and capital and property. The categories of corporate and capital and property taxes are commonly associated with wealthy social groups and/or increase or decrease in their collections may expose weaknesses in legal safeguards and institutional transparency. Rashid et al. (2020) find that democracy is positively associated with all four categories of tax revenue in developed countries and that this association is strongest (weakest) for the personal (corporate) tax revenue category. On the other hand, in developing countries the positive association weakens – or becomes negative for corporate and indirect tax revenues – when compared with developed countries.

Understanding the differential impact of democracy on tax revenue in developed and developing countries is important for making meaningful public finance policies. It is likely that because they have stronger democracies, developed countries also have stronger economic institutions and more resources for collecting higher levels of tax revenue as compared to the weaker economic institutions in weaker democracies in the developing world. In the developing world, tax revenue is an important growth engine for the economy, and Rashid et al.'s (2020) results contradict the common belief that democracy may have a positive effect on tax revenue especially on corporate tax revenue. Simultaneously, their findings show that democracy may have a positive impact on tax revenue in developed countries.

The organization of the rest of the paper is as follows. The "Conceptual Framework" section presents the conceptual framework. Section "Discussions on Data and Empirical Findings" discusses the data and empirical results. Section "Conclusion and Implications" offers conclusions and implications.

## Conceptual Framework

There is an ongoing debate on whether democracy impacts tax revenue positively or negatively. On one hand, according to legitimacy theory, stronger democracies are likely to enable governments to impose more taxes on their citizens so that they can offer citizens more property protection. With higher level of suffrage under democracy, citizens put pressure on governments for more services, which require additional government funding from tax revenue (Timmons 2005; Garcia and von Haldenwang 2016). Weaker democracies, on the other hand, may collect less tax because such governments may prefer to please business and political elites at the cost of more tax collection (Gerry and Mickiewicz 2008; Boix 2003). Conversely, weaker democracy may mean higher tax revenue because more authoritarian governments may use coercion to raise taxes (Olson 1993).

The two theories – compatibility and conflict perspective – help explain why democracy may have an opposing impact on tax revenue in developed and developing countries (Rashid et al. 2020). It is the prevailing level of maturity of economic, legal, and social institutional setup in a country that can make a difference in collections of tax revenue. The compatibility perspective posits that democracy facilitates economic growth

and promotes business investment because it ensures protection of civil liberties, basic freedoms, and increased free and fair political participation (Baum and Lake 2003; Sirowy and Inkeles 1990). These features are more likely to occur in developed countries that have mature economic, legal, and social institutions that effectively implement the changes under democratic systems. These factors help democracy achieve public policy objectives such as collecting tax revenue. Therefore, consistent with the compatibility perspective, it is expected that a stronger democracy would have a positive impact on tax revenue for developed countries (Rashid et al. 2020).

On the other hand, the conflict perspective proposes that democracy allows interest groups in a society to increase rent-seeking activities by means that include corruption and bribery (Baum and Lake 2003). Under democratic governments that allow more political freedom, politicians and bureaucrats in partnership with other interest groups try to maximize their share of the state's economic pie (Nelson and Singh 1998). In democracies, moreover, labor and trade unions may actively demand high wages that can result in strikes; consequentially the state may lose output. Further, the conflict perspective proposes that governments offering more political freedoms are less effective in a basic duty and responsibility: regulating the economy for smooth functioning. These predictions are more relevant to developing countries with democratic governments where the prevailing economic, legal, social, and institutional setups are weak and so cannot carry out effective changes under democracy. Hence, consistent with conflict perspective, it is expected that democracy would have a non-positive impact on tax revenue for developing countries (Rashid et al. 2020).

## Discussions on Data and Empirical Findings

### Data

The Economist Intelligence Unit (EIU) (2010, 2013) measures Democracy Index using five indicators: electoral process, functioning of government, political participation, political culture, and civil liberties. This is a new democracy proxy in the literature (Rashid et al. 2020). The commonly used proxies for democracy are Polity2 index that captures the political strength of democratic institutions (reported in the Polity IV dataset) and the civil liberties indicator reflecting the protection of civil liberties (found in Freedom House dataset). The 2003 World Bank classification of developing countries (those with per capita GDP lower than $9,206) may be used to identify the developing and developed countries (Gordon and Li 2009).

### Summary Statistics

The average total tax collections from all sources in developing countries and developed countries are 20.05% of GPD and 27.28% of GDP, respectively (Rashid et al. 2020). Figure 1 shows the difference between the average tax revenue of different types between developing and developed countries in percentage of GDP. The types of tax revenue are personal, corporate, indirect, and capital and property. The graph shows that the mean personal tax revenue for developed countries is four times as high as that of developing countries (7.27% vs. 2.96% of GDP). The size of this difference is not surprising. The majority of the population in developing countries has low income, while in developed countries, most taxpayers are middle-income. There seems to be little difference in corporate tax revenue between developing and developed countries: 2.91% of GDP in developed countries and 2.81% of GDP in developing countries. Figure 1 also shows that the average indirect tax revenue contribution to GDP in developing countries is 1.04% higher than that in developed countries. Last and least, capital and property tax revenues are lowest in both types of countries (1.65% of GDP in developed countries vs. 0.89% of GDP in developing countries). The average democracy scores for developing and developed countries are 6.54 and 7.89, respectively.

**Tax Collections and Democracy in Developing and Developed Countries, Fig. 1** Different categories of average tax revenue collections as a percentage of GDP in developed and developing countries. (Source: Authors' computation from the summary statistics of Rashid et al. (2020))

### Relation Between Democracy and Tax Revenue

In a comparative study, Rashid et al. (2020) find that, in general, democracy has a positive effect on total tax revenue. However, when contrasting the developing countries with developed countries, the effect of democracy on total tax revenue in developing countries is significantly lower than in developed countries. Findings are similar for all categories of tax revenue. In fact, the effect of democracy on corporate tax revenue and indirect tax revenue in developing countries is negative, relative to developed countries. However, for personal tax revenue, and for capital and property tax revenue, the net effect of democracy is positive in developing countries. Researchers used regression methods to control for other factors that may influence tax collection. This finding implies that corporate tax revenue is the main category in which democracy in developing countries fails to facilitate tax collection. In the developing world, corporations are more likely to avoid paying full taxes by taking advantage of the corruption in the economic, legal, and political institutions. The lack of confidence in the corrupt institutions acts as a deterrent to the willingness to pay taxes. Taken together, democracy may be associated with increased tax revenues in developed countries, whereas it may indicate lower tax revenue in developing countries, especially in the corporate and indirect tax revenue categories (Rashid et al. 2020).

## Conclusion and Implications

The objective of this paper is to discuss democracy's differing impact on tax revenues between developing and developed countries and on public policy implications. Two competing theoretical frameworks – the compatibility perspective and the conflict perspective – help explain the impact on tax revenue collection of democratic governments. The compatibility perspective proposes that higher economic development correlates with higher levels of democracy and hence predicts a positive effect on tax revenue. On the other hand, the conflict perspective argues that democracy interferes with economic growth because it allows interest groups to engage in unimpeded interference; it therefore predicts a negative effect on tax collection.

Consistent with the compatibility perspective, empirical evidence suggests that democracy has a positive association with all categories of tax revenues in developed countries (Rashid et al. 2020). Consistent with the conflict perspective, the negative effect of democracy on tax collection in developing countries is most pronounced for the corporate tax revenue category (Rashid et al. 2020). To offset the negative effects on tax collection for governments in developing countries, effective policies must be in place to counter the relationship between interest groups and politicians. An important policy solution is to actively increase

levels of transparency: about prevailing tax rates for different categories of tax revenue, about tax policies for the rich and poor, and about proposed tax changes. The government should allow the public to scrutinize the government's past performance.

Tax Avoidance; Tax Evasion

## Definitions

Tax compliance refers to taxpayers' decision to comply with tax laws and regulations by paying tax timely and accurately.

## Introduction: The Essential Roles of Taxation

Public finance issue can be characterized by the issue of tax compliance. However, the high rate of tax compliance could maintain healthy public finance without imposing tax burden. Taxation plays an essential role in financing public expenditures through income distribution. To ensure sustainable funding for the production and delivery of public services, different tax policies should be adopted. Tax enforcement is one kind of fiscal policy that enables governments to finance public programs. Ideally, tax revenue is an authentic source of government spending. As tax payments enable the government to redistribute wealth among citizens by offering better public goods and services, applicable approaches for enhancing tax collection and tax compliance should be considered. To enhance tax compliance and improve competence tax administration, taxpayers' intentions toward tax compliance must be understood (Hauptman et al. 2014). Thus, this chapter demonstrates (1) forms of tax compliance

and (2) contemporary fiscal policy and tax administration.

## Forms of Tax Compliance

The slippery slope framework has broadened and transformed research on tax compliance. This framework categorizes all possible factors – including voluntary or enforcement approaches and deterrence or psychological factors – into a single framework in order to analyze the possible effects on tax compliance (Kirchler et al. 2008). Tax compliance outcome can be reached by voluntary or enforced compliance. Voluntary compliance refers to taxpayers' voluntary actions with respect to dutiful obligation without revenue administrations' control, whereas enforced compliance generally means the coercive intervention of the revenue administration to increase tax compliance (Randlane 2016). Compliant taxpayers deserve voluntary approaches, including trust in the tax system or tax authority. The use of power and trust should be applied differently based on taxpayers' perspective toward tax compliance. Thus, policies based on voluntary actions and authority interventions provide guidance for tax administration to increase both tax compliance and tax revenue.

## Enforced Tax Compliance Perspectives

The earliest study on individual tax compliance by Allingham and Sandmo (1972) described how individuals may decide to comply with tax systems to avoid being investigated by tax agencies. Taxpayers decide to accurately pay their taxes or reduce the amount of taxes they pay after they are not investigated. Allingham and Sandmo (1972) also addressed policy instruments to eliminate tax evasion, such as the "tax rate, penalty rate, and probability of detection" (p. 338). People will stop evading taxes when they realize that the penalty and the detection rate are too high relative to the amount of money that they could save. Researchers describe deterrence approaches as the determinants of tax compliance (Park and Hyun 2003).

Recent studies confirmed that deterrence approaches provide the power of tax administration to functionalize enforced tax compliance (Muehlbacher and Kirchler 2010). Turner (2005) specified that the law authorizes tax officials with "coercive and legitimated power" to implement revenue collection (p. 8). By law, the tax authority has the power to enhance tax compliance. The tax authority also has the authoritative power to lawfully punish the illegal reduction in tax payments by conducting tax audits and imposing penalties. The absence of strict laws will cause the tax system to operate ineffectively (Bird and Davis-Nozemack 2018). To enhance tax compliance, the tax administration should be granted sufficient power to implement the monitoring and auditing roles by imposing penalties on tax evaders. Kirchler et al. (2008) found that the power of authority enhances compliance. Increasing the power of authority represents the enforcement approach. According to Slemrod and Bakija (2017), if the role of the Internal Revenue Service (IRS) in the United States were absent, free riders would continuously ignore their taxable obligations, while dutiful taxpayers would still remit their tax liabilities, demonstrating that the IRS plays the authoritative role in lawfully protecting legal taxpayers from being exploited by the tax evaders or free riders.

Tax audits sometimes result in penalties that require taxpayers to pay the amount of tax due in addition to a fine for evasion. Penalties have a negative effect on tax evasion (Park and Hyun 2003). That is, penalty regulations control people's behavior better than a voluntary approach. Park and Hyun (2003) noted that, in addition to penalties, the "tax rate and audit" help to promote tax compliance (p. 673). Based on theoretical assumptions, tax penalties serve two purposes: functional tools and definitional functions (Doran 2009). Doran (2009) noted that the functional tool of penalties enhances compliance, while the definitional function only defines tax compliance. In this regard, Devos (2013) addressed the importance of strict penalties, which minimize tax evasion intentions. Anderson

(2017) examined the utilization of nudges to alert taxpayers about the threats of fine and penalization upon tax law violations in the audit cases in Nebraska and indicated that twice two nudges could increase the probability of using tax reports and collecting more tax revenue. In the United States, taxpayers who fail to pay tax liabilities will encounter different types of penalties, and high level of fraud will also cause them to face legal challenges, including "criminal charges and jail sentences" (Slemrod and Bakija 2017, p. 252). Imposing such penalties could allow taxpayers to exhibit a dutiful responsibility for tax compliance.

In addition to law enforcement, the probability of detection also reflects the potentiality of tax authority to seek out fraud committed by tax evaders. The ability to identify taxpayer risk will help tax officials increase their level of detection. A high detection level indicates that the tax authority can detect wrongdoing. Increasing the probability of detection will increase tax audit. Thus, taxpayers may perceive that the probability of being caught is also high. The probability of detection is defined as the chance that the tax administration can deter non-compliant taxpayers and eliminate tax evasion. Taxpayers may decide to violate taxation law if there is zero probability of detection. Taxpayers who perceive a high level of detection will tend not to engage in tax evasion, which results in tax compliance enhancement (Hauptman et al. 2014).

## Voluntary Tax Compliance Perspectives

Psychological determinants also influence tax compliance. Luttmer and Singhal (2014) identified the importance of tax morale, which derives from taxpayers' intrinsic tax compliance beliefs. Moreover, the psychological aspect, including the strong bond between taxpayers and the government, could encourage taxpayers' desire to refrain from evading taxes and promote their honesty in settling tax liability (Yee et al. 2017).

Honest taxpayers should be treated by psychological approaches rather than deterrence approaches because of their voluntarism to pay tax. While some people are dissatisfied with this obligation required by law, others are willing to pay taxes; these individuals accept responsibility for their obligation (Brockmann et al. 2016). This psychological concept is called tax morale, which Torgler and Werner (2005) defined as "the intrinsic motivation to pay tax that affects compliance behaviour" (p. 460). Tax morale is influenced by others and by the motivation to pay taxes (Luttmer and Singhal 2014). For instance, taxpayers follow other compliant taxpayers once they realize that they are conducting business in a high-compliance environment. Tax morale is an essential element of tax compliance because it helps to increase tax compliance (Devos 2013; Luttmer and Singhal 2014). The study of tax compliance in China addressed the important role of Confucianism, which influences on the morale value that results in stimulating higher tax compliance (Young et al. 2016). In this case, Confucianism has existed for a long period of time because the influence of ancestral roots in Chinese society is such that the next generation adapts itself to this belief. For instance, in the past, the belief that evading taxes is wrong has been carrying on until the late generation. Furthermore, morale aspects also influence taxpayers' decision about whether they should comply with the current tax system or not, but their understanding of the immorality of being dishonest toward the current tax system tends to conversely contradict the evasion intention (Yee et al. 2017). Inherently, increased tax morals among the public could enhance tax compliance because the people's psychological views contribute to the promotion of voluntary compliance, instead of enforced compliance.

Another psychological aspect of tax compliance is known as trust in tax authority, referring to the attitude toward public authorities that can provide essential and beneficial services to individual or groups of taxpayers (Kirchler et al. 2008). In a synergistic tax climate, as described by Kirchler and his colleagues, tax authorities and taxpayers work cooperatively together in a high-trust condition, leading to the promotion of voluntary tax compliance. Additionally, Kogler et al. (2013) indicated that high trust and low trust in tax authorities increase and decrease tax compliance,

respectively. Kirchler et al. (2008) argued that, when tax officials have greater capacity to detect illegal taxpayers, taxpayer trust in officials' performance increases. Kirchler and colleagues introduced the slippery slope framework, which provides evidence that trust in tax authority influences voluntary tax compliance.

In addition to building mutual trust between taxpayers and the tax administration, stimulating taxpayer awareness becomes a critical catalyst to increase tax compliance (Yee et al. 2017). Accordingly, Youde and Lim (2019) pointed out that taxpayer awareness primarily refers to taxpayers' understanding of tax mechanisms and taxation law. Taxpayers' awareness regarding the tax system includes information about tax payments and the different types of taxes that they must pay, including the specific tax rates, tax bases, tax exemptions, and so on. Thus, taxpayer education is an effective instrument to enhance tax compliance (Park and Hyun 2003). Taxpayers voluntarily pay taxes if they understand the variety of taxes that they have an obligation to pay and how to benefit from their contributions. For instance, revenues derived from property taxes are utilized to finance local expenditures on education and health services in local communities. Tax education provides taxpayers information so that they have more knowledge and, consequently, comply with taxation law.

## Contemporary Fiscal Policy and Tax Administration

Psychological approaches become considerate inputs for the contemporary fiscal policy. Current tax administration reform intentionally encourages taxpayers to voluntarily comply before the forceful implementation of the tax law. Voluntary actions consume less cost in promoting tax compliance (Randlane 2016). Thereby, the creation of synergistic tax climate includes the complementary trust between the tax authority and taxpayers (Kirchler et al. 2014). However, tax compliance cannot be achieved without the enforcement approaches. The condition that voluntary mechanism is not practical to influence taxpayers' compliance perspective and law enforcement becomes the alternative mechanism. The current administration could advance legal regulations that impose a compliance burden on tax evaders. Promoting taxpayers' compliance perspectives through severe penalties could follow the enhancement of voluntary compliance in the initial step. Taxpayers will intentionally comply only if tax evaders are sanctioned by high penalties. A satisfactory level of tax compliance will be attained once credible sanctions are lawfully imposed on non-compliance taxpayers (Bird 2004). Therefore, achieving high compliance rate should integrate both psychological and deterrence approaches (Youde and Lim 2019). Developing countries with cities or regions that perform better than many other parts of the countries could face a common dilemma: how to "extract" as much tax revenue as possible from the regions that are sources of income without overburdening taxpayers with regulations and inspections (enforcement) or discouraging them from correctly (voluntarily) filing and paying taxes. Youde and Lim (2019) empirically revealed that both psychological and deterrence approaches, such as tax law enforcement and trust in tax authority, are significant determinants for increasing high-compliance perspective while mitigating low- and medium-compliance perspective of the medium taxpayers in Siem Reap Province, Cambodia.

## Conclusion

Tax compliance maximization must be achieved by the optimal combination of voluntary and enforced compliance approaches. Taxpayers need to be treated based on their intention to be compliant. Fear and penalization approaches are not applicable to impose on high-morale taxpayers, and these approaches may break their mutual trust in the tax authority. Because honest taxpayers perform a role as whistle-blowers on tax evaders, frequent suspicion and auditing should not be inherently conducted on this group that exhibits voluntary cooperation (Muehlbacher and Kirchler 2010). Otherwise, increasing the

probability of detection and audit should be immediately implemented in order to collect the loss of tax revenue upon the decline of tax compliance rate.

# Tax Compliance Policy and Administration in Nigeria

Robert Dibie
Department of Public Administration and Health Management, Indiana University Kokomo, Kokomo, IN, USA

## Synonyms

Accountability; Administrative reform; Compliance; Policy reform; Taxation

## Definition

The term tax is defined as a revenue generated by the federal or state or regional governments respectively to provide goods and services to its citizens and general public (Gruber 2019). Because of the problem of income inequality in any country, there may be a role for a government in solving the free-rider incidence by taxing its citizens to provide public redistribution of goods and services (Flores-Macias 2018; Gruber 2019). In addition, tax compliance is defined as the desire for citizens of a nation to comply with tax laws, policies, rules, and regulation as well as paying

T

annual tax timely as specified by law (Gruber 2019; Schiller 2018).

## Introduction

In Nigeria, tax policies have become the most common and relevant instruments for collecting revenue (Fagbemi and Abogun 2014; Foluso 2013). One of the major goals for the adoption of tax compliance administrative and policy reforms in the country is to provide resources needed for the provision and distribution of public goods services to the citizens (see Dibie 2018). Despite these very important policy objectives, the rate of tax compliance of the citizens of Nigeria has been very low (African Development Bank 2011; OECD 2012). According to Schiller (2018), the capacity of a political system to sustain disincentivizing self-aggrandizement behavior of political leaders has created a major governance reform concern for taxpayers.

According to Bird (2013), Flores-Macias (2018), and Prichard (2015), taxation is a link that galvanizes accountability between citizens and government to be more responsive in implementing administrative reform policies that could alleviate inequality in any country. Bird (2012) and Prichard (2015) contend that taxation could help to create a fiscal exchange between citizens and government in respect of the quality of public good, trust, and income. This is because some Nigerian citizens avoid paying taxes as a form of protest for the lack of quality public goods and services (see Alabede 2014; Fjeldstad 2014). The most common tax systems in Nigeria are payroll tax, individual income tax, corporate tax, and consumption tax such as sales or value-added tax or goods and services tax. Value-added tax as used in the chapter refers to tax that is added to the price of a service or product at each stage of distribution, production, or sale to the consumer or the person that purchases the product.

Some scholars have argued that adopting a direct tax system could enable citizens to pay according to their ability or progressively, this approach, however, has not been effective in Nigeria (see Kiabel and Nwokah 2009). Despite the fact that the direct tax system may be easier to collect, it may not ensure the desired distribution of the tax burden in Nigeria because of the problem of noncompliance. In the private sector, especially the retail business of the country, there is a high level of noncompliance (African Development Bank 2011; Bird 2013; Dibie 2018).

The literature on tax compliance and administrative reforms in Africa identifies economic recession, hyperinflation, natural disaster, high unemployment, safety, and security as barriers to plying taxes (see Alabede 2014; Bird 2013; Fjeldstad 2014; Jibao and Prichard 2015). In addition, low level of education, trust in government, and equity in the distribution of goods and services, corruption, and more structural factors tend to affect governments' ability to collect tax or enforce tax compliance (Fagbemi and Abogun 2014; Fjeldstad 2014; Jibao and Prichard 2015; Prichard 2015).

One of the major problems of government revenue generation in Nigeria through taxes is the incidence of non-tax compliance by some income earners for reasons best known to them (see Badara 2012; Kiabel and Nwokah 2009). Government employees were seen to be more tax compliant because their taxes are deducted directly from the source (PAYE).

Pay-as-you-earn tax or pay-as-you-go as used in this paper refers to deducting or withholding some percentage of income of an employee or staff of an organization as a form of direct government tax. Unlike those employees in the private sector that may manipulate their data in such a way that their tax burden becomes lower than required by law, federal, state, and local government staff do not have such option (Alabede 2014; Kiabel and Nwokah 2009). Unfortunately, the Government of Nigeria tends to use the adversarial approach for tax collection (see Fagbemi and Abogun 2014). Rather than promoting cooperation between taxpayers and tax administrators, suspicion of taxpayers often reveals detection of cheating by auditing as well as a variety of judicial and administrative reform measures (Alabede 2014; Vazquez-Caro and Bird 2011).

What is missing in the tax compliance and administrative reforms literature in Nigeria is the

gap between methods of solving the impediments or lack of compliance and appropriate actions that are needed to improve tax management in the country. This chapter investigates the factors that determine tax policy compliance and the impediments to effective tax administrative forms in Nigeria. The objectives are to determine (a) if there is a relationship between knowledge of tax laws and compliance in Nigeria and (b) if there is a positive relationship between corruption and tax compliance. It recommended a benchmark model that the Government of Nigeria and other African countries facing similar predicaments could adopt to prevent tax evasion. It prescribes the use of information technology and the provision of regular electricity in rural and urban regions of Nigeria. One of the goals of this paper is to go beyond the current literature on tax compliance policies.

## Conceptual Framework for Tax Compliance

In many countries there are different types of taxes which can be classified into four broad categories: (1) tax on corporate income; (2) individual income tax; (3) taxes on consumption; and (4) taxes on wealth (see Alabede 2014; Flores-Macias 2018; Gruber 2019). Most governments including the federal and state governments of Nigeria depend heavily on individual income taxes. Many other countries in Africa receive much of their tax revenue from consumption taxes such as VAT (value-added tax) (see African Development Bank 2011; OECD 2012).

The principal-agent models were propounded by Jansen and Meckling (1976). The model explains that reform policies could be most faithfully implemented when implementation is easy to monitor. Seljan (2014) and Weingast (1984) contend that information is the most important mechanism to modify agent's behavior. This is because if the principal gets that right information, he or she could anticipate the reaction of the agent at any time (see Bohren 1998). In respect of tax compliance administrative reforms, if information monitoring warrants coordination, taxpayers will not have a private incentive to expand resources to ensure compliance.

The benchmark approach and strategic practices have been recommended as one of the best methods for evaluating the performance of tax administration reforms (Flores-Macias 2018; Gruber 2019). According to Vazquez-Caro and Bird (2011), benchmarking is an effective way of establishing a timetable for tax compliance. The approach helps to set a clear and ideally measurable objective to determine tax compliance outcomes. The benchmark approach requires the setting of appropriate performance measure that strategically spells out the objectives that are expected (see Vazquez-Caro and Bird 2011). The benchmark approach is also referred to as the cooperative compliance model because it not only focuses on expanding tax collection but ensures that citizens pay their fair share of taxes (Baer et al. 2002).

Figure 1 shows the dynamics between taxation and policy makers in facilitating tax compliance administrative reforms. A tax system in any country should facilitate a better relationship between the government administrators (agent) and the citizens (principal). This relationship could also galvanize accountability between citizens and political leaders as well as make government to be more responsive in implementing policies that could alleviate inequality in any country. The figure also shows that the relationship between taxpayer and the government could create a major principal-agent predicament.

The concepts and theories discussed in this chapter support the need to have a positive relationship between tax payed by citizens and the amount of public goods and services received by taxpayers. The literature on taxation also reveals that citizens' trust in government is paramount to individuals, business owners' support, and tax compliance policy. One of the major arguments presented is that proactive tax administration reforms, pragmatic benchmarks, and considerable as well as sustained initiatives are required before tax administration, sustainable development, and nation-building goals could be attained in Nigeria (Dibie 2018; Jibao and Prichard 2015). In addition, the citizens of Nigeria may have to consider

**Tax Compliance Policy and Administration in Nigeria, Fig. 1** The dynamics of taxation and citizens/public leaders relations. (Source: Designed by Robert Dibie 2020)

new tax administrative reform initiatives as legitimate before voluntary tax compliance will take place in the country.

## Research Method

The purpose of this paper is to investigate the factors that determine tax policy compliance and impediments to effective tax administration in Nigeria. A total of 5000 questionnaires were administered to citizens of Nigeria. A total of 3800 (76%) questionnaires were completed and returned by the respondents. Four hundred in-depth interviews were also conducted. The participants of the interviews include the same sample of respondents as those of the questionnaire. The participants of the study included many tax administrators working for the federal and state governments, private sole corporations staff, partnership corporation staff, retail outlet owners, nongovernmental organizations (NGOs) staff, suppliers and distributors, clerical officers, treasurer of civil society groups, law enforcement officers in companies, stakeholders such as vendors, and senior administrators of various companies**.** The participants were residents of Abuja, the national capital, and 16 states in the southern and middle regions of Nigeria.

The secondary data consists of the review of related government reports in Nigeria and academic and professional journals. The research was conducted between 2018 and 2019 in Nigeria. Data collected were analyzed with SPSS statistical tool and presented in correlations, tables, and percentiles.

The central research questions are: (1) "What do you think are the impediments to individual citizen's tax compliance in Nigeria?," (2) "Why are some business owners not paying taxes in Nigeria?," and (3) "Do you believe that the federal and state governments in Nigeria are effective in the administration of tax compliance in the country?."

The limitation of the study is that only states in southern and middle region of Nigeria were covered by this research. Federal, state, and local governments' employees were not covered in this study because their taxes are deductible in the form of "pay-as-you-earn progressive system" unlike those employees in some private sector. In addition, most of the state governments share almost the same characteristics except for a few that are located in rural regions and lack electricity. The dependent variable is tax compliance, and the independent variables are individual tax compliance impediments, business owners' tax impediments, and government tax administration impediments.

## Analysis of Data and Discussion

Demographic characteristics of the 3800 respondents that returned the completed questionnaires reveal that 56% were male, while 44% were female. About 38% were in the age range of 45–65 years old. While 34% were between 25 and 45 years old. The youngest group were 28% and between 19 and 24 years of age. The questionnaire was divided into three sections: (1) individuals, (2) small business owners, and (3) federal and state governments' tax administrators. One thousand three hundred twenty respondents in the private sector provided response to the first section. Another 1400 small business owners also completed the questionnaire. The third section of the questionnaire was completed by 1080 tax administrators at both the federal and several state governments, respectively.

The 400 in-depth one-on-one interviews were also conducted with respondents from the three sectors stated above: (1) individuals, 130 respondents; (2) small business owners, 150 respondents; and (3) federal and state governments' tax administrators, 120 respondents. Some of the comments of these interview respondents are provided in each of the three research questionnaire tables below. As stated previously in this paper, federal and state governments' staff were not included in the study of (1) individuals and (2) small business owners because they already pay their taxes through the PAYE system.

Research Question 1: What do you think are the impediments to individual citizen's tax compliance in Nigeria?

Table 1 shows the major reasons why individual respondents failed to comply with Nigeria's governments tax laws. Among the 1320 participants that responded to the individual section of the questionnaire, 88.4% indicated that they fail to comply because of the poor economic situation in the country. As a result of the non-caring attitude of the tax administrators and political leaders in the country, 81% of the respondents stated that they do not trust the Government of Nigeria because of the way it is handling the economy as well as the inadequate distribution of goods and services in the country. In addition, 81% of the respondents indicated that the reason why they do not comply with the tax laws in the country is because they are not satisfied with the inadequate goods and services provided by both the federal and state governments in Nigeria. Further, 79.5% of the respondents stated that they do not comply with tax laws because of inequitable distribution of goods and services in the country. Eighty-five percent reported that they do not trust tax administrators in Nigeria.

In addition, Table 1 also shows that 79% of the respondents indicated that they do not pay taxes either because they are not employed or they are concerned with the high rate of unemployment among university graduates in the country. Eighty-nine percent indicated that due to arbitrary corruption by both political leaders and senior public administrators, they do not wish to comply with tax laws in the country. On one hand, 88.4% questionnaire respondents reported that they do not pay taxes due to the bad economic situation in Nigeria. On the other hand, 79.4% of the respondents indicated that because of lack of constructive government and citizen relationship or engagement in Nigeria, they do not feel compelled to comply with tax policies. The mean of Table 1 data is Agree 81.5% and Disagree 17.1%, respectively.

Furthermore, 63% of the individual interview respondents indicated that they fail to pay taxes

**Tax Compliance Policy and Administration in Nigeria, Table 1** Why individual citizens fail to pay taxes

| No. | Questions | # of strongly disagree | # of disagree | # of neutral | # of strongly agree | # of agree | % of disagree | % agree | Total 1320 |

* indicates positive but moderate significance of the correlation

because they cannot see what the government might be doing with the citizens' money that they collect as taxes. Another 34% of the interview respondents from this sector stated that one of the reasons why they do not pay taxes is because they believe that the federal and state governments' officials do not care about the welfare of the citizens. Another 94% of the individuals' interview respondents indicated that rather than Nigerian political leaders using taxpayers' money to provide goods and services for every citizen to benefit or enjoy, they would take the nation's money to Europe or the United States to enjoy with their family members while the poor people in the country suffers. Fifty-eight percent of the individual group interview respondents stated that they were not aware of some of the federal and state governments' tax laws in Nigeria.

Forty-nine percent of the respondents living in rural communities and are farmers stated that they have not paid taxes in their entire life. When the

individual respondents interviewed were asked about their perception of tax laws in Nigeria, 59% indicated that it is very bad. Another 22% stated that it is fair but it will require a lot of study time in order to attain better understanding. The remaining 29% indicated that because they are currently unemployed it would not be fair to rate the tax laws of the country. Below are some of the statements made by the interview respondents:

> Why should I pay taxes to the government of Nigeria while I provide my own electricity and water. The government of Nigeria has made all the citizens to become local governments by making us to be very individualistic in providing goods and services for ourselves. It is really a shame and sad.
>
> Corruption among Nigerian political leaders and senior public administrators has no doubt contributed to the ineffective utilization of tax revenue to address the needs of the citizens.
>
> I am a poor farmer why should I be asked to pay tax.
>
> The government does not feed me, despite the fact that I do not have a job, so why should I pay tax. Please do not bother me with tax issues. Nigeria is not the government for the people and by the people.

Coefficient:

$$r = \text{Correlation} \frac{(\Sigma^{xy}) - (\Sigma^{x})(\Sigma^{y})}{\sqrt{\left[{}^{n}(\Sigma_{X}{}^{2}) - (\Sigma^{x})^{2}\right]\left[{}^{n}(\Sigma^{y})^{2} - (\Sigma^{y})^{2}\right]}}$$

Table 2 shows the correlation matrix for tax compliance in Nigeria. The table also shows a very strong positive correlation (0.117) between non-tax compliance and poor economic situation in Nigeria. There is also a positive correlation between non-tax compliance and corruption by political leaders and tax administrators (0.116) in the country. Further, while there is a strong correlation between non-tax compliance and low trust in government (0.114), the relationship between non-tax compliance and low level of education is positive (0.124) but not as high. In addition, on one hand, there is a positive correlation between non-tax compliance and high unemployment rate (0.095), and on the other hand, there is also a positive relationship between citizens not satisfied with the inadequate good and services provided by the government and non-tax compliance (0.105) in Nigeria. In addition, there is a moderate positive correlation (0.076) between low level of education and non-tax compliance by the citizens The negative tax compliance is significant in all the factors that were examined by the questionnaire. *The data analysis confirms the major reasons why individuals in Nigeria do not comply with the tax laws of the country.*

Table 3 shows the major reasons why small business owner respondents failed to comply with Nigeria government's tax laws. Among the 1400 small business owners that responded to the questionnaire, 100% indicated that they do not use cash machine to monitor their business transaction or sales. As a result of this major impediment, they are unable to accurately calculate the profit and loss as well as the required percentage tax to pay each year.

Another 91% of the small business owner stated that because they operate in rural areas where there

are no tax offices nearby or where tax administrators do not check their activities, they have not been complying with the tax laws in Nigeria. In addition, 82% of the small business owners in cities and rural areas reported that they do not pay taxes because of the inability (poor bookkeeping skills) to accurately measure their annual expenses and profit. Another set of 76.4% of the small business owners' respondents indicated that previous high outsourcing tax compliance cost has discouraged them from paying their taxes. While 70% of the small business respondents reported that they were not aware of the tax laws in Nigeria, the same group of 70% of the respondents also stated that corruption by tax administrators constitute why they do not wish to pay taxes. In addition, 83% of the small business owners' respondents disagree that business low profit is not an excuse for non-tax compliance. The mean of Table 3 data is Agree 66% and Disagree 32.5%, respectively.

Research Question 2: Why are some business owners not paying taxes in Nigeria?

Among the 150 small business owners that were interviewed, 57% indicated that it was cheaper to pay tax inspector some bribe than to spend money on outsourcing all their business bookkeeping. They acknowledge that many tax administrators are more interested in negotiating with small business owners to reduce their tax payment in return for courtesy gift or bribe. To compound the above problem, 72% of the respondents that they were not aware that they are legally required to register their business with the in-land revenue tax office in Nigeria. Another 45% indicated that they do know that the law requires them to have a business license.

In addition, 27% of the respondents indicated that tax compliance issues are very difficult to handle due to the very small nature of their volatile business operations. Nineteen percent also reported that the fear of aggressive tax administrators who are not interested in negotiating bribe as well as weak enforcement of the law has made them to have mixed feeling whether to comply or not. When the small business owners' respondents interviewed were asked about their perception of tax laws in Nigeria, 88% indicated that it is very bad. This is because they struggle to understand the provisions of the tax form or how to calculate percentages. Below are some of the statements made by the interview respondents:

> Since government tax inspectors or administrators have never come to bother me, why should I go to their office to report myself or spend my hard-earned money to pay tax.

> Corruption associated with tax administrators or inspectors and their desire to achieve revenue target or extract bribe is a major impediment to tax collection in Nigeria.

Table 4 shows a strong positive correlation (0.260) of not using cash machine to monitor sales and non-tax compliance. There is also a strong positive correlation between no accurate measure of annual profit and loss (0.087) and non-tax compliance. The impediment of rural location of small business and no tax office nearby (0.175) reflects a positive relationship with non-tax compliance as well. Further, the small size of business has a strong positive correlation (0.058) with the non-tax compliance in Nigeria. The correlation analysis also shows that there is a negative correlation between non-tax compliance and business owners' profit margin (0.024). There is a negative correlation between low education level (0.026) of small business owners and non-tax compliance in the country. Small business owners' failure to pay tax because of difficulty in bookkeeping or poor record of revenue and expenditure cost (0.066) shows a positive correlation with non-tax compliance.

Some of the findings are consistent with the outcome of the research previously performed by Yesegat et al. (2017), in respect of tax compliance problems in developing countries. *The data analysis confirms the major reasons why small business owners in Nigeria do not comply with the tax laws of the country.*

**Tax Compliance Policy and Administration in Nigeria, Table 4** Correlation matrix for individual tax compliance

Table 5 addresses research question 3 which focused mainly on finding out what tax administrators felt was affecting their ability to effectively administer tax compliance laws in the country. The questionnaire was administered to 1080 tax administrators at the federal and state governments' levels in the country. Seventy-seven percent of the respondents agree that federal and state governments are effectively enforcing tax compliance laws in the country, while 23.15% disagree. Further 97.2% of the respondents indicated that the lack of appropriate assessment of business owners' profit and loss constitutes sub-standard in the administration of tax policies in Nigeria. Ninety-one percent of the respondents also acknowledge that lack of government incentives

Source: Derived from Field research in Nigeria in 2018 and 2019
* indicates positive but moderate significance of the correlation

and poor working condition have affected the ability of tax administrators to work diligently in executing their functions. On one hand, 82% of the tax administrators' respondents stated that poor communication between the tax office (federal and state governments) and citizens is another major issue affecting the enforcement of tax compliance laws in Nigeria. On the other hand, 81.6% of the respondents reported that inadequate number of tax inspectors to enforce the tax laws in the country has contributed to lower revenue generation of the government. In addition to the above tax administration problems, 72% among the interviewed tax administrators alluded to the fact that corruption among some of their colleagues also negatively affects the administration of tax compliance laws in Nigeria.

Research Question 3: Do you believe that the federal and state governments in Nigeria are effective in the administration of tax compliance in the country?

In addition, 79.4% of the tax administrators that completed the questionnaire confirmed that limited availability of information about tax regulation and the fact that many citizens do not know the tax laws are other issues that make them to believe that the administration of tax laws in the country is not effective. Two other very important issues that were also confirmed by tax administrators in Nigeria are (1) weak relationship between federal, state governments, and citizens (72.2%) and (2) government negligence of citizens living in rural communities in the country. Eighty-six percent of the tax administrators indicated that there are some inspectors that are very corrupt. Furthermore, 86% of the tax administrators confirm that because staff are not provided with computers, it is often difficult for them to conduct their job faster and accurately. The mean of Table 3 data is Agree 73.6% and Disagree 25%, respectively.

An in-depth interview was conducted to 120 tax administrators at the federal and state government levels. Interview results show that 75% of tax administrators confirm that many citizens in Nigeria have negative perception about the fairness and competence of tax inspectors. As a result of this perception, 81% of the respondents believe that tax administrators do not accurately calculate citizens and small business organizations tax returns, respectively. In addition, 85% of the interviewed respondents in the federal and state tax offices, respectively, indicated that tax compliance law in Nigeria may not be perfect but it has had greater impact on companies and pay-as-you-earn (PAYE) system all over the country.

Further 61% of the interview respondents indicated that there has been positive difference since 1999 when the military administration handed power to a democratic elected government. The tax administrators also contend that there are more people paying taxes now than what it used to be before 1999. Another 83% of the tax administrators interviewed also acknowledge that there are many small retailers in the country that do not pay taxes. It is also very difficult to ask people that are very poor to pay taxes when they live with less than $US2 (two US dollars a day). In addition 58% of tax administrators' respondents indicated that many administrators often tend to disregard some aspects of the tax laws because they believe that some sections of the laws cannot be enforced to poor people in the country because of the relative tax compliance costs as a share of turnover in their business.

Table 6 shows that there is a low negative correlation between office use of information technology in tax administration (0.006) and effective administration of tax compliance in Nigeria. In addition, the lack of appropriate assessment of business owners' profit and loss (0.089) has positive correlation with ineffective administration of tax compliance. Another very important area is the positive correlation between lack of government incentives and poor working condition (0.080) and ineffective administration of tax laws. Furthermore, poor communication between local governments and citizens (0.073) has a positive correlation with ineffective administration with tax compliance. It is very interesting to note that there is a positive correlation between inadequate number of tax inspectors to enforce the tax laws (0.072) and ineffective tax administration

**Tax Compliance Policy and Administration in Nigeria, Table 6** Correlation matrix of effective in the administration of tax compliance

| Tax compliance factors | Index | Average agree factors in % | Average disagree factors in % |
|---|---|---|---|
| Tax Policy Index | 0.051 | 73.6 | 25 |
| Lack of appropriate assessment of business owners' profit and loss | 0.089** | 97.2 | 2.8 |
| Lack of government incentives and poor working condition | 0.080** | 91 | 9.25 |
| Our office use information technology in tax administration | 0.006 | 9.5 | 86 |
| Poor communication between federal and state governments and citizens | 0.073** | 82 | 18.1 |
| Inadequate number of tax inspectors to enforce the tax laws | 0.072** | 81.6 | 17.4 |
| Corruption among some tax administrators | 0.050[a] | 72 | 27.5 |

[a]Correlation is significant at the 0.05 level (two-tailed)
** Indicates positive but strong significance of the correlation

in Nigeria. Lastly, corruption has a moderate positive correlation (0.050) with ineffective tax administration in the country. *The data analysis confirms the major reasons why tax administrators are not effectively administering tax compliance in Nigeria.* In addition, the strong positive correlation between tax evasion and corruption results is also consistent with the findings of Coolidge's (2012) research in other developing countries.

## Tax Administration Reform Policy Recommendations

What can the Federal Government of Nigeria do to establish new standards for evaluating its tax administration performance? The answer to this question will be the basis for the following tax administration reform policy recommendations.

It is recommended that the Federal Government of Nigeria should explore a more pragmatic tax design method that could enhance or foster an equitable tax system for the citizen and all taxpayers in the country (Bird 2013; Fagbemi and Abogun 2014). According to Fjeldstad (2014), the best approach to achieve this new tax administration reform policy goal is to facilitate new information and communication technologies, adopt new taxpayer identification number, and move from a universal or national approach to a model that is organized around different industrial sizes and states or localities. This new user-friendly benchmark approach could make the collection of taxes to be simplified (OECD 2012). New tax initiative could also provide a fruitful avenue for further research on economic reform in Nigeria.

The Nigeria Government should adopt a benchmark tax administration reform system that could enable the government to allow local tax consultants and international agencies to collaborate to provide appropriate guidelines or objectives for appraisal of tax administration in the country (Vazquez-Caro and Bird 2011). This benchmark system of tax administration could also enable tax experts in the Nigeria to periodically collect appropriate data and analyze them to determine their compliance rate and other factors that could enable the government to improve on its tax administration functions (Alabede 2014; Fagbemi and Abogun 2014).

The Federal Government of Nigeria should also consider a web-based e-filing system in the country. It is important to note that one of the latest methods and best practice of tax administration are electronic payment and e-filling systems (see Vazquez-Caro and Bird 2011). The e-filling tax administration and electronic payment methods have also been identified as better methods for encouraging compliance and taxpayer service (see Manaf et al. 2010).

Furthermore, there is an urgent need to educate the self-employed about tax policies in the country. One of the strategies to accomplish the above goals is the simplification of the current tax structure and the abolishment of some taxes. In most cases developing nations that have adopted a customer-service, user-friendly, and one-stop tax administration reform initiatives have been more successful (Coolidge 2012; Flores-Macias 2018; Fjeldstad 2014).

## Conclusion

This chapter has examined the determinants of non-tax compliance among individuals and business owners in Nigeria. The data analysis confirms the major reasons why individuals and small business owners in Nigeria do not comply with the tax laws of the country. The study also confirms the major reasons why tax administrators are not effectively administering tax compliance in Nigeria. The utilization of modern technology and building more Inland Revenue (tax) offices in all local governments as well as providing constant electricity supply are possible solutions to the identified compliance problems. The governments in Nigeria must also be mindful that the enforcement of compliance governance reforms would require more tax inspectors in the country. New initiatives to stimulate economic development all over the Nigeria could also increase tax compliance in the country.

Tax policies and administrative reforms in Nigeria are not neutral and technical choice but the embodiments of citizens and ethical leaders as well as the promotion of economic development programs. The federal and state governments of Nigeria should establish simple and predictable tax systems that will not discourage private business owners' operation as well as minimize interference with market trends in the country. Future research should investigate how the Federal Government of Nigeria could better encourage citizens in the rural areas in the country to build trust and comply with the tax administrative reform laws.

## Synonyms

Tax avoidance; Tax dodging; Tax evasion

## Definition

Tax evasion: is the illegal evasion of taxes by individuals or organizations (corporations), commonly associated with the informal economy and sometimes with the criminal behavior of the entrepreneurs.

Tax avoidance: is a form of minimization of tax liabilities when a person is excluded from a category of payers of some tax by means of lawful acts and consequently does not pay the tax. Depending on the legitimacy of such actions, the methods of tax avoidance can be divided into those that are legal and illegal.

## Introduction: The Tax Evasion Problem

In the Russian practices of state administration, tax evasion is interpreted as the purposeful actions of a taxpayer allowing him to avoid or decrease, to a greater or lesser extent, his compulsory payments in the form of taxes, charges, duties, and other payments. From the point of view of the legislation, these actions are characterized by the following mandatory characteristics: firstly, the taxpayer's deliberate acts and secondly, their orientation at reduction of the taxation amount. At the same time, according to Clause 3 of the

Informational Letter of the Supreme Arbitration Court of the Russian Federation of November 23, 1992 No. S-13/OP-329, "About the practices of resolution of disputes related to application of the tax legislation," unintended or negligent actions in themselves (e.g., because of the accountants' negligence, inexperience, or a calculation error) resulting in reduction of tax payments cannot be considered as tax evasion methods.

According to the Federal State Statistics Service's data (http://www.gks.ru), the number of tax crimes detected in Russia in the 2000s demonstrated reductive dynamics, but nevertheless the number still remains high. For instance, in 2011, as compared to the year 2000, the number of tax crimes investigated under Article 198 of the Criminal Code of the Russian Federation, "Tax evasion by a physical person," decreased by 83.8%, and under Article 199 of the Criminal Code of the Russian Federation, "Tax evasion by an organization," by 84%. But at the same time, there is a tendency toward increase in the share of tax crimes committed on large and especially large scales, which explains the growth of budget losses from insufficient receipt of tax payments.

According to the Federal Tax Service's data (http://nalog.ru), about 16–17% of taxpayers pay their taxes diligently. About 60% of taxpayers pay taxes while attempting to minimize their tax liabilities in all legal and, more often, illegal ways. The rest do not pay taxes. According to recent data collected by officials, the amount of money lost from the state budget due to the tax evasion problem in Russia is 1325.8 billion rubles (about 22 billion dollars). Expert estimations of Russia's shadow economy vary, with the amount of income concealed from taxation between 20 and 40% of the national GDP.

In Russia, like in any other state, tax evasion is considered a problem with adverse effects both on the economy and on the state in general. The state budget receives fewer funds than it is due and is therefore forced to limit its expenses. The consequences of this include discontinuation of some government programs, nonpayment of public sector workers' salaries, and so on, all the way to applying the sequestration procedure. In addition, tax dodging can have serious economic consequences expressed in a breach of competition principles. For example, two identical companies that produce certain goods will experience unequal conditions if one of them evades tax payments. For this reason, combating tax evasion is a main area of activity for governmental authorities such as the tax inspectorate, the police, the Federal Financial Monitoring Service, and the Central Bank.

The social consequences of tax evasion are no less important. On the one hand, such actions signal problems in the social contract between the state and its citizens, and on the other hand, they are a force that shakes the foundations of loyalty to the state. Until quite recently, the Russian tax system was characterized by the principle of "stability in return for loyalty," in which the government guaranteed political and economic stability, while payment of taxes was evidence of the citizens' loyalty (Auzan 2010).

These days, such understanding is complicated by the increasing ephemerality of measurement of the goods provided by the state, as well as by toughening of legal and economic sanctions for violations of tax legislation. The situation, in which concrete financial resources are opposite abstract advantages and tangible sanctions, is quite logically viewed by people as unfair. Furthermore, despite taxes being the most important link between social and economic relations within the state, the nature of tax relations in many cases assumes the shape of tax voluntarism expressed by weak laws, in neglect of the legislative norms and rules in existence. As a consequence, distancing between the state and taxpayers happens, contributing to tax nihilism of different social groups and a decrease of citizen loyalty to the state.

## Forms of Tax Evasion

The rather numerous forms of tax evasion differ by legal nature. Combined into certain groups,

depending on the nature and content of the taxpayer's actions, tax evasion appears to be committed in three main forms: tax evasion as such, tax avoidance, and tax evasion without breaking the law (tax planning or tax optimization).

*Tax evasion as such* is accomplished by way of committing a tax offense or a crime through direct violation of the tax legislation. The taxpayer's actions are illegal and wrongful from the beginning. These actions may be aimed either at reduction of the amount of tax paid to the state or at complete nonpayment of the tax. Tax evasion is most often committed in the form of concealment of income, concealment or exempting of other items of taxation, falsification of accounting data, delayed filing of or failure to file documents required for calculation and payment of taxes, and unlawful use of tax exemption. As tax evasion is achieved by illegitimate and deliberate actions of the taxpayer, the legislation provides for different kinds of responsibility for committing them: civil, administrative, criminal, and tax responsibility. It is the purposeful violation of tax legislation that distinguishes tax evasion from tax planning or tax optimization.

*Tax avoidance* is a form of minimization of tax liabilities when a person is excluded from a category of payers of some tax by means of lawful acts and consequently does not pay the tax. Depending on the legitimacy of such actions, the methods of tax avoidance can be divided into those that are legal and illegal.

The first group of methods includes refraining from carrying out activities subject to tax, a legal person's carrying out of activities that are not subject to tax by virtue of law, or a legal or natural person's carrying out of activities, the incomes from which are not subject to tax. For example, in accordance with Article 145.1 of the Tax Code of the Russian Federation, an organization that has been granted the status of a participant in the project for research, development, and commercialization of results for the Skolkovo Innovation Center is eligible for waiver of taxpayer's obligations associated with calculation and payment of value-added tax within 10 years from the date when the relevant status was granted.

The second group of tax avoidance methods, comprised of unlawful methods that result in illegal reduction or avoidance of taxes, suggests straightforward tax evasion. This group of methods includes entrepreneurship without governmental registration or without registration with tax agencies.

*Tax evasion without violation of the law (such as tax planning or tax optimization)* is a form of reduction of tax liabilities by means of the taxpayer's deliberate lawful actions that take full advantage of all benefits provided by the law, and of other techniques and mechanisms, aimed at lawful avoidance of taxes. In other words, tax evasion without violation of the law involves organization of such enterprise activities where tax payments are minimized on legal grounds.

## The Reasons for Tax Evasion

The desire to avoid taxes is a peculiar reaction to the state's tax measures. This reaction seems natural to some extent, as it is conditioned by an attempt to protect, in one way or another, possessions, capital, and incomes from any infringements, even from those authorized by law. Several reasons urge the evasion of taxes: moral (ethical and psychological), political, economic, and technical (legal) reasons (Balashov and Rudakov 2015).

*The moral (ethical and psychological) reasons* mostly lie in and are generated by the nature of the tax laws. If the authority of any other law is based on its longtime and uniform application, which is most often conditioned by being common for everybody, constant, and impartial, then the tax law is neither common, nor constant, nor impartial, as tax benefits are granted to certain categories of taxpayers and not to others, with the result that certain groups are at an advantage. Additionally, continuous changes in the tax legislation, and the population's perception that the state makes tax laws solely for its own benefit, can contribute to a refusal to pay taxes on philosophical grounds.

*The political reasons* urge the taxpayer to evade taxes when the state begins using taxes

not only to provide for its functioning but also as an instrument of social or economic policy. Taxes are used as an instrument of social policy quite often; for example, the ruling class will use taxes to suppress other classes. Tax evasion here serves as a form of resistance to such suppression. Taxes play the role of an instrument of economic policy when the state raises taxes on some production branches in order to decrease their relative share in the economy and lowers taxes on other branches, which are more promising or less developed, for the purpose of their quickest development. In such a situation, the companies in branches for which taxes have been raised attempt to evade them, and the main purpose of this evasion is not only mercenary interest but also a desire to maintain the business, and the branch at large, at the same level.

*The economic reasons* urging the taxpayer to evade taxes can be divided into two types: the reasons that depend on the taxpayer's financial position and the reasons generated by general economic conditions.

The taxpayer's financial position often becomes the determinant for tax evasion. The taxpayer evaluates whether the profit from tax evasion will exceed the possible adverse effects. If evasion pays off economically, it is highly likely that the taxpayer will not pay taxes. In this case, the higher the tax rate, the stronger the desire to evade will be, because the profit obtained naturally increases. If the taxpayer's financial position is stable, he may choose not to commit tax evasion so as not to ruin his reputation, but if his financial position is critical, he may take this path without hesitation.

Economic reasons generated by general economic conditions show themselves during periods of both economic slump and boom. During economic recessions, as a rule, a parallel uncontrolled "shadow" market appears alongside the legal market, abiding by its own laws and functions in violation of rules set by the state. Transactions carried out in this market are not subject to taxation because they cannot be controlled by the state. On the other side, during economic booms and expansion of international economic exchange, the opportunities for entrepreneurs to conceal their incomes abroad thanks to free floating of capital will increase as well.

*The technical (legal) reasons* lie in the complexity of the tax system, which inhibits the effectiveness of tax control, with the result that the taxpayer can avoid paying taxes.

In most cases, the taxpayer does not take part in tax evasion for only one of the reasons listed above, but, most often, for several reasons which are not mutually exclusive. These reasons, forming a certain set, may sometimes force even law-abiding citizens to evade taxes.

## The Struggle Against Tax Evasion

The state uses several methods to combat tax evasion: the substance-over-form doctrine, the business purpose doctrine, the right of tax and other authorities to appeal transactions, the presumption of taxability, and filling gaps in the tax legislation.

*The substance-over-form doctrine* comes down to the fact that the legal consequences of a transaction are determined by its substance but not by its form. In other words, if the form of a transaction does not correspond to the facts, the transaction will be interpreted based on the legal relations that have been established in reality. In this context, Clause 1 of Article 45 of the Tax Code of the Russian Federation grants tax authorities the right to change the classification of transactions concluded by taxpaying business entities. For example, if the execution and accounting of a transaction do not correspond to the actual nature of the economic operation, tax authorities are entitled to reclassify commission agreements into product delivery contracts and independent work contracts into employment agreements. This will result in enterprises being charged arrears and penalties. Transactions between a branch and its head organization that have an effect on tax base reduction can be recognized as imaginary if the taxpayers' interdependence is proved to the tax authorities.

The essence of the business purpose doctrine is that a transaction that creates tax advantages is invalid if it does not achieve the business goal.

In other words, all actions taken by the transaction parties must be aimed either at making profit or enhancing the company's value. Actions (transactions) aimed solely at reduction of the company's tax payments are viewed as contradictory to the purposes of its creation and functioning. For example, a Russian company counted the amounts of agent commissions paid under agency agreements to a company registered in the British Virgin Islands (BVI), and to a number of others, as expenses reducing the tax base for profit tax. The court agreed with the tax inspectorate's conclusion that the taxpayer had no need to involve agents for the purpose of receiving commercial assistance services of search for potential buyers of his products in the territory of one of the CIS republics because information about such buyers was publicly available. Consequently, the expenses in the form of agent commission paid to the BVI company were not recognized as economically justified for the purposes of profit tax imposition, because the taxpayer failed to give evidence of the existence of a reasonable business goal for conclusion of agency agreements with the said organizations (decision of the Ninth Arbitration Appeal Court of April 16, 2013 in the case No. A36-4941/2012).

*The right of tax and other authorities to appeal transactions* is one of the main methods of struggle against tax evasion. Tax authorities have the right to appeal transactions carried out by legal and natural persons. According to Russian legislation, simulated and fraudulent transactions can be invalidated by the court. A simulated transaction is carried out only for the sake of appearances, without an intention to create the relevant legal consequences. Such a transaction, if rendered invalid, does not entail any legal consequences. If a transaction is rendered simulated, this can result in quite serious consequences for the enterprise. For example, a company provides charity support, the amounts of which are exempted from profit tax, but which exists only on paper (without actual transfer of the sums but with execution of the corresponding document). This transaction will be rendered invalid by the court, which in its turn will result in application of financial sanctions against the company.

A transaction will be rendered fraudulent if it has been carried out for the purpose of disguising another transaction. It will be subject to the rules which the parties had in view when performing the actual transaction. For example, a commission agreement can be passed off by the company as a purchase and sale agreement. If this agreement is rendered fraudulent, it will be subject to the provisions that govern commission relations, and consequently the results of the activities of one of the parties under the agreement will be liable to incremental rates of taxation.

*The presumption of taxability* assumes that all items of taxation must be taxed, except those expressly stipulated by law. Additionally, while in criminal law there is the principle of "presumption of innocence," in which the accused does not have to prove his innocence and the investigative authorities must prove his guilt; in tax law the "presumption of taxability" principle turns into the presumption of the taxpayer's guilt, which implies that the taxpayer must prove his innocence if the tax inspectorate charges an arrear.

*Filling gaps in the tax legislation* involves legislative bodies passing relevant amendments to tax laws in order to close various "loopholes" that allow for tax evasion. Such amendments are mostly passed based on the results of the tax authorities' practical activities, as well as on proposals brought to the parliament in connection with discovered cases of legal tax evasion committed because of vagueness and crudity of the laws. For example, in the early 1990s the amounts of material aid paid to employees of enterprises in Russia were not subject to income tax. Due to this, many companies started paying monthly material aid to their employees instead of salary in order to avoid paying the tax. Legislators passed amendments to the Law on Income Tax Levied on Physical Persons, according to which material aid is now exempted from income tax only within the 12-fold minimum wage amount.

The legislations of various countries provide administrative responsibility for tax evasion in the form of a fine and also criminal responsibility in certain cases.

## Tax Evasion and the Problem of Loyalty

If taxes are not only an economic instrument but also one of the possible instruments of communication between the state and its citizens, the problem of loyalty comes to the fore when tax evasion is considered (Sanina 2009). Today, it is clear that the existence of states is conditioned less by history than by the ways in which each new generation of citizens repeats their choice of state, identifies with it, and demonstrates loyalty to it.

In the macrosocial aspect, loyalty can be characterized as the "emotional link" (Connor 2007) that connects the individual and the social whole. Loyalty to the state contributes to a sense of co-belonging, to the state identity, and also to the individual's self-realization as a citizen of the state. On the other hand, loyalty is expressed in the actions and behavior of people who comprise a special social community: the state. Loyalty to the state is characterized by high stability as it is associated with all the elements of national and civil solidarity (Grodzins 1956). The language, the geography and history of the country, its traditions, holidays, and sports competitions – these as a whole support loyalty to the state. Loyalty emerges to give the individual the need for identification and sense of community and also for actions, such as paying taxes.

In 1773, Enlightenment philosopher Baron d'Holbach stated that the more the people love their government, the more they will trust it, and the more benefit the state gives its citizens, the more willing the people will be to sacrifice for the state. Justice, reasonable freedom, the ruler care for the subjects' interests, and provision for the nation's safety are the basic foundations for successful functioning of the taxation system; taxes are always commensurate with the government's kindness toward its citizens, with the people's wealth, and with the benefits and advantages they enjoy (Holbach 2001). In English philosopher Francis Bacon's opinion, written in 1625, taxes collected with the people's consent are always better for the society. He also believed that the matter is not the wallet but the heart; a tribute collected with the people's consent, or without it, may be the same for the wallets, but its impact on the people's spirit will not be the same (Bacon 1884).

These ideas illustrate the importance of the bilateral nature of justice in the formation of loyalty to the state. The fact that it receives no attention in the Russian state is demonstrated by the definition of tax in the Tax Code of the Russian Federation: Tax is a compulsory, individually non-refundable payment collected from organizations and natural persons in the form of alienation of monetary funds owned, controlled, or managed by them, for the purposes of financial support of the activities of the state and/or of municipal formations (Tax Code). The definition of tax as an individually non-refundable payment is the marker showing that observing the rules of exchange is not obligatory for the state, which, consequently, upsets the balance of loyalty. If the state obliges the taxpayers to give a certain percentage of their income to the public purse, the taxpayers are entitled to demand a certain return, such as a high quality of social security, an advanced social infrastructure, free education and healthcare, etc. An upset in the balance between investment and income feels like social injustice.

Tax relations are just one of the aspects of interaction between the state and society, but even a brief theoretical analysis suggests that the problem of loyalty occurs at the level of recognition of the existing governmental power by the individual and appears to be directly associated with justice in the interaction between the state and the society. According to Scottish philosopher David Hume, loyalty is a product of the mutual tacit agreement between the state and its citizens concerning provision for the stable situation and development of the society in general (Hume 1896). In this context, loyalty is directly associated with legitimacy in its broad social and political sense as recognition of the existing government's lawfulness by its own society and by other states.

Systematic violation of the "exchange rules" from the state's side contributes to an accumulation of the sense of social dissatisfaction and discontent in the population and, as a consequence, to a decrease in loyalty and motivation to pay taxes. This, in its turn, leads to transformation of

the taxpayers' behavior. Instead of exchanging concrete financial resources for abstract benefits, they prefer to avoid paying taxes (Sanina 2012). At the same time, the state does not use the positive type of exchange with the taxpayers (reward for reward), but the negative type (reward for fear of punishment). As a result, the social exchange relations in the tax sphere do not only become difficult but almost impossible over time, resulting in adverse consequences such as economic stagnation, breach of social relations, decrease of social and political stability in the society, and aggravation of the emotional and psychological climate. Accordingly, finding a solution to the problem of tax evasion is inseparably associated with the problem of forming the state identity, the "we image" as the base for everyday social, political, economic, and legal interactions.

## Definitions

| | |
|---|---|
| Tax avoidance | It is an action taken to lessen tax liability and maximize after-tax income. |
| Tax evasion | It is an illegal and intentional actions taken by individuals' intentional illegal behavior leading to a direct violation of tax law to escape or to reduce their legally due tax obligations and hiding the real value of a legal contractor transaction to avoid or reduce fiscal liabilities. |
| Voluntary compliance | It is a system of compliance that relies on individual citizens to report their income freely and voluntarily, calculate their tax liability correctly, and file a tax return on time. |

## Introduction

Tax avoidance uses different methods to transfer profits, fortunes, and inheritances from Germany to one of the well-known tax havens in the Caymans, Panama, or other countries like the Netherlands and Ireland (Murphy 2019). The tax laws in these countries are the basis for the biggest companies of the world for transferring their

profits to tax havens instead of paying the full and regular taxes in Germany where the profits were made. It is a negative phenomenon that if the majority of taxpayers notice these tax avoidance strategies of the "big players" and realize that their own situation is completely different, then this situation has a psychologically disastrous effect.

In Germany, in addition to income tax evasion, the value-added tax (VAT) fraud is the most serious field of tax evasion. Value Added Tax (VAT) fraud is often initiated by internationally operating, and criminal structures and the damage by VAT tax evasion is gigantic. The difference between income tax and VAT fraud is that income tax fraud regularly leads to a deficit for the treasury in form of a lack of tax revenue, but VAT fraud, in some constellations, withdraws real money from the cash.

The majority of German individual taxpayers have almost no chances to optimize their tax payments. Even majority of small local companies are not able to use any tax avoidance concepts. Their tax data and payments are digitalized and automated. Germany is a high tax country where tax bill has a noticeable impact on the average taxpayer. According to OECD study (2018), Germany is one of the countries with the highest tax burden worldwide. Many tax concepts, originally designed as legal tax avoidance models, have been classified after tax auditing as tax evasion; some of the tax avoidance concepts were afterwards judged as criminal tax fraud. There is a fluent *transition* between tax avoidance and tax evasion in Germany.

## Tax Audit and Criminal Investigation

Tax evasion involves a fine or imprisonment of up to 5 years in Germany. For particularly serious cases, German law provides for imprisonment of 6 months up to 10 years. An evasion of more than €100,000 within 1 year is regarded as particularly serious.

In Germany, tax audit is implemented as the complex fiscal system. There are different regular *tax audit units*, operating in the legal field of tax law, and *tax investigation units* in cases of tax evasion. German system of tax audit is a complex, many-layered system that is regulated by the *federal structure* of the country. In addition, tax audit is in the jurisdiction of the 16 states of Germany. All states have their own tax audit units. However, the Federation has tax audit units as well in the field of taxes (for some special constellations) and – exclusively – in the field of customs.

Each German state has a considerable large number of local tax authorities. For example, North Rhine-Westphalia, the most populated state with Cologne as biggest city, has 104 *local tax offices*. Each of these offices has tax audit units. North Rhine-Westfalia has 15 *special authorities* whose competence is auditing the biggest companies in that area. In addition, there are 10 special authorities doing nothing but tax investigation audits.

There are a number of different approaches in local tax audit. There are six different approaches in local tax audit, and then that they are divided into two types. The most important type is the traditional tax audit. The auditing teams appear in a company to review past taxable periods. They review whether the tax declaration is complete and according to the tax law. If it is not, corrected tax assessments are addressed after the tax audit or, in the worst case, criminal investigations will be initiated. There are three different approaches in this traditional tax audit. The most important is the tax audit in the narrow sense (*Betriebsprüfung*). In this kind of tax audit, all types of taxes (especially income/corporation tax, value-added tax, and the communal trade tax) are target of the review.

In 2017, more than 13,500 auditors (in all 16 states) did tax audits of that type (Federal Ministry of Finance 2018a). They executed about 195,000 audits and obtained a total 17.5 billion euros surplus of taxes in 2017. In addition, there are further two approaches in the field of value-added tax (*Umsatzsteuersonderprüfung*) and the income tax on wages (*Lohnsteuerau-ßenprüfung*). Both approaches are limited to that respective type of tax. Tax audits reviewing VAT were executed in 2017 by 1,848 auditors who did around 83,000 audits and made a surplus of 1.53 billion euros (Federal Ministry of Finance 2018b). Finally, tax on wages audits lead to a surplus of

945 million euros. These audits were executed by 2,032 auditors in about 100,000 cases (Federal Ministry of Finance 2018c).

There is a second type in local tax audit and also three approaches that share one feature together. This type of tax audit is the inspection instead of audit. It is *not* a *backward* audit but the inspection's review of the *current period* of taxation. Inspections are the junction between tax audit and criminal investigation. Inspections take places if there is cause for suspicion, additional investigations are mounted. All three types of inspections can be moved easily into a criminal investigation. First of all, the VAT investigation was established already in 2002, followed by the inspection for tax on wages in 2013. In 2018, a special inspection was introduced. It is an inspection for cash desks/cash register systems. German tax authorities try to reduce their reaction time versus criminal attacks and to strengthen their effectivity. Using these inspections, German tax authorities try to implement a real-time defense against tax evasion in addition to the traditional backward tax audits.

In Germany, the persecution of tax evasion is a complicated, shared-competence solution split between tax authorities and the public prosecutors. The *prosecutors* are responsible for all investigations in relation with criminal offences. But the tax administration and the customs administration have their own prosecution units and police-like units. In case of *tax evasion,* the *tax administration* and *tax investigation unit* are responsible for investigation on first stage. There are tax investigation units in two different constructions. They are a department of a local tax office or – only in a few states – they are organized in separate tax offices. For example, at North Rhine-Westphalia, there are 10 tax investigation offices. Within the tax investigation units, there are two branches. First, there is a police-like unit (*Steuerfahndung*) that works like the regular criminal investigation department. But the members of this branch do neither have uniforms, nor weapons, nor are they called officers; they are civilians. Second unit is much smaller branch that is working similar to prosecutors (*Strafsachenstelle*) but does not have exactly the same competences. A prosecutor is authorized to evocate a case from this branch of the tax investigation unit.

The case numbers of the tax investigation units vary from year to year substantially. In 2017, approximately 2,500 tax investigators in Germany worked 100,000 cases. That resulted to a tax surplus of 2.9 billion euros from the fiscal point of view. On the other hand, their work resulted in 1586 years of imprisonment and millions of financial penalties (Federal Ministry of Finance, Germany 2018).

## Types of Tax Evasion and Tax Administration's Decisions

The tax audit units in Germany are one-dimensionally focused on a *surplus of taxes*. But there is another problem that is quite the opposite of tax evasion and could be detected by tax audit units as well: money laundering. It would be necessary to change the statistic guidelines to tax audit in Germany. At the moment, the only target the auditors are interested in is the result of more taxes. But the problem with money laundering is not a wrong tax declaration (maybe it is if *more* profit is declared to be paid tax on than truly was made), but the question is to discover the sources of money that was used to make an investment (into restaurants, real estate properties, or companies). German tax offices at the moment do almost not audit the *sources* of money – they are only interested in taxes. According to a lot of experts, it is a great weakness of the German tax audit system. A lot of tax experts consider that money laundry even more dangerous to a community than tax evasion. It will be a mission for the next years to discover money laundering structures in Germany and to improve the tax audit processes.

The decision of the Federal Court (*Bundesgerichtshof*) from May 20, 2008 sentenced a revolutionary interpretation of a very special detail of German tax evasion law. In Germany, it is possible to make a *self-denunciation* to receive impunity from a tax evasion. Until that decision, some criteria of § 371 AO (*Abgabenordnung* = the general fiscal code in

Germany), the rule that describes the requirements of a self-denunciation, were interpreted very extensively in favor of the tax evader. After that decision, the interpretation was much more restrictive. The German legislature took the chance and changed the whole paragraph according to that new strict interpretation. This was really an interesting and rare situation because in that case first there was the judges' interpretation and then the law was made according to the judgment.

The decision of the Federal Court from December 2, 2008 was treating a very sensible aspect of German penal law. And once more, the Federal Court took surprisingly a very restrictive position to the disadvantage of the accused. Within this decision, the Federal Court described its attitude towards the appropriate *level of penalties* on tax evasion. Tax evasion (§ 370 AO) has a range of penalties from financial penalty to imprisonment up to 5 years (in some cases 10 years). Sentencing Judge/Sentencing Court find the appropriate penalty sentence based on German penal law. The Federal Court was obviously deeply unsatisfied and annoyed about the penalties sentenced by the lower courts. But the Federal Court has no right to change the penalty sentence from a lower court – therefore this decision was quite a teaching lesson to the lower courts how to sentence tax evasion correctly. There is a very important frontier in German penal law: prison sentence up to 2 years are suspendable. The lower courts tended to suspend tax evasion sentences even with enormous damages of more than a million euros. The Federal Court pointed out that up to its opinion tax evasion of more than a million could not be on probation. It is typical for German judges to understand their judicial independence that this Federal Court judgment did not bother the lower judges at all.

## Cases of German Tax Evasion

The following cases provided examples of tax evasion which are classified under criminal law as German tax evasion. First of all, German law is not a case law but mainly based on *legislative acts*. Therefore, the meaning of a court judgment is not as important as it is in other legal systems. Especially in criminal law, more important than former judgments is the individual guilt of an accused person. Therefore, to talk about special *cases* in German tax evasion means to talk about either very large evasions or about very spectacular cases efficacious to the publicity. Only a few decisions could be called an important lead principle sentence. If in the following section, some cases will be presented, the first of them are such lead principles and the other ones represent very spectacular cases.

### Case 1

The most important example is the so-called Cum-Ex-Scandal. It was a question of using a tax statement indicating the deducible investment income tax twice (or more) even though the tax has been paid only once. The "trick" was to sell shares with (cum) and without (ex) dividend a few times around the day of dividend payment and to deduce a special tax a few times. The damages by this cum-ex method are estimated to 55 billion euros in the EU and 31 billion euros in Germany (Daubenberger et al. 2018). The first report on this concept and its suspected illegality was written in 1992. In 2012, a change in legislation took place and stopped those cum-ex deals. Especially during 2005 and 2012, it was the banking lobby that wrote one paper after the other to influence the Parliament and the Finance Secretary not to change legislation. These cum-ex deals were supposed to be tax avoidance at that time while nowadays by most of the experts and some of the first court decisions Cum-Ex is assumed to be an illegal tax conceptions and criminal tax evasions.

### Case 2

The decision of the City of Bochum district court from January 26, 2009 (Bochum District Court 2017) sentenced a German top manager, *Dr. Klaus Zumwinkel*, former CEO of Deutsche Post AG, one of Germany's biggest companies to 2 years imprisonment plus one million euros financial penalty. Dr. Zumwinkel was one of the first individuals whose data concerning income on capital investments unknown to the German authorities

were found on the so-called Liechtenstein-Switzerland-DVD. Since 2006, German authorities, e.g., the secret service, bought about a dozen DVD with thousands of persons' data on it who transferred their money to Switzerland and illegally did not unfold the yielded interests and capital incomes in their tax declarations. Dr. Zumwinkel was, bad luck for him, in the eyes of the prosecutors and the tax investigators the most prominent person on this data Liechtenstein-Switzerland-DVD and therefore he was arrested almost in front of TV cameras (obviously the information was given to the press). This spectacular event – Dr. Zumwinkel was consultant of the German Chancellor – should signalize the seriousness of the situation to the other individuals on the using of Liechtenstein-Switzerland-DVD. The intention was to provoke self-denunciations. And the idea was a phenomenal success. Up to now, more than 130,000 self-denunciations arrived at German tax offices. The volume of tax evasion was more than a billion euros.

### Case 3

The decision of the City of Munich district court from March 3, 2014 (Munich District Court 2014) was the tax evasion trial that had the biggest publicity ever in Germany. The accused in that case was *Ulrich "Uli" Hoeneß*, chairman of the supervisory board of Bayern Munich Football Club, World and European Champion as a player with the German national football team – a hero for millions. Hoeneß failed a last second self-denunciation and was sentenced for tax evasion of 28.5 million euros. The judgment was 3.5 years. Today he is back in his position as a football manager.

### Case 4

In the eyes of the author, the decision of the City of Bochum district court from October 5, 2017 (Bochum District Court 2017), the last one to be outlined here, was the most remarkable and strange tax evasion trial that has ever taken place in Germany. The accused person was *Werner Mauss*, also known as Claus Möllner, Dieter Koch, or Richard Nelson, who is described as a civilian employee to several national and international police and intelligence service authorities – he is a spy, a real-life version of James Bond. The Bochum court sentenced Mauss to 2 years (on probation) but the judgment is not definitive up to now because the Federal Court remitted the case to another district court.

## Conclusion

Tax administration has several tools to encourage voluntary tax compliance and enforce taxes in its arsenal. The most prominent of such tools are tax audits. By auditing taxpayer records, tax administrators detect taxpayers who fail to fulfill their tax obligations and impose penalties and fines. The effective audit programs induce voluntary tax compliance. During the last years, the EU founded an EU-prosecution unit (EPPO) (EU 2017) and – concerning customs – the EU established and extended another unit: OLAF – the European anti-fraud unit. For the national German tax system, the VAT is especially susceptible to fraud and the prime target to tax evasion. To improve this situation in German tax administration, the EU directives were transformed into national German law (European Commission 2019).

In addition to the effect of perceived probability of audit, there is a specific deterrence effect of audits on the audited. Individuals generally appear to alter their perceived probability of audit upwards in the few years following an actual audit, increasing reported wages, self-employment income, and other types of income for three to 4 years following the audit.

## Synonyms

Evasion; Financial crime; Negligence

## Definitions

| | |
|---|---|
| Tax avoidance | an action taken to lessen tax liability and maximize after-tax income. |
| Tax evasion | the illegal and intentional nonpayment or underpayment of tax leading to a direct violation of tax law to escape or reduce a legally due tax obligation. |
| Gross tax gap | the difference between the true tax liability for a given tax year and the amount that is paid on time. |
| Net tax gap | the portion of the gross tax gap that will never be recovered through enforcement or other late payments. |
| Voluntary compliance | a system of compliance that relies on individual citizens to report their income freely and voluntarily, calculate their tax liability correctly, and file a tax return on time. |

## Introduction

The American system of taxation is based on the premise that all income is taxable (which includes illegally earned income). The IRS (2019) reveals that in many instances, proving that a taxpayer willfully attempted to hide income from the federal government is an integral part of proving other criminal activities including fraud, money laundering, or Bank Secrecy Act violations. Criminal investigation continues to fulfill the important role of helping to ensure the integrity and fairness of our nations' tax system.

Tax evasion cases are taxpayers who either under- or misreport their income or deductions or hide money outside of the USA or simply choose not to file a tax return. Tax evasion occurs when taxpayers fail to accurately report their full tax liabilities on tax returns (i.e., underreporting), pay taxes due from filed returns (i.e., underpayment), or file a required tax return altogether or on time (i.e., non-filing) (Joint Committee on Taxation 2019).

There are multiple forms of employment tax evasion, which include pyramiding, employee leasing, paying employees in cash, filing false payroll tax returns, and failing to file payroll tax returns. The Internal Revenue Department (2018) explains "pyramiding" of employment taxes as a fraudulent practice where a business withholds taxes from its employees but intentionally fails to release them to the IRS. Businesses involved in pyramiding frequently file for bankruptcy to discharge the liabilities accrued and then start a new business under a different name and begin a new scheme. However, even if the business files for bankruptcy, they are not allowed to put "employee payroll taxes" (also known as civil penalties or trust fund recovery penalties) not paid into the bankruptcy.

A second scheme of employment tax evasion is known as "employee leasing" which the IRS (2018) discloses as the practice of contracting with outside businesses to handle administrative, personnel, and payroll concerns for employees. In some instances, employee-leasing companies fail to pay over to the IRS any portion of the collected employment taxes. These taxes are then spent by the owners on business or personal expenses, often leading to the demise of the company, leaving millions in employment taxes unpaid.

The third scheme known to the IRS (2018) is "paying employees in cash," a common method used to evade income and employment taxes, resulting in lost tax revenue to the IRS and future social security or Medicare benefits for the employee.

The tax gap is predominant in cash-related industries such as barbers, cosmetologists, waitress/waiters, and restaurant/bar establishment owners. This issue has been brought to the IRS's attention for a multitude of years, and the IRS acknowledged the issue with additional training provided by the IRS online for these industries. Yet in recent years, many legitimate taxpaying entities or organizations within these industries are seeking additional IRS assistance to help "shrink the tax gap" via the continuation of training both live and online to help heighten the awareness within these industries to avoid the pitfalls caused by the tax gap.

The main methods that commonly used to evade employment taxes are filing false payroll tax returns, understating the amount of wages on which taxes are owed, and failing to file employment tax returns. The income of self-employed individuals is not reported to the federal or state taxing authority by a third party. The lack of secondary income reporting among self-employed individuals could hinder the probability that this group would be detected by the IRS for tax evasion.

## Tax Evasion and Tax Gap

The main reason for the tax gap is tax evasion. According to IRS (2018), the gross tax gap is the difference between the true tax liability for a given tax year and the amount that is paid on time. It is comprised of the non-filing gap, the underreporting gap, and the underpayment gap. The net tax gap is the portion of the gross tax gap that will never be recovered through enforcement or other late payments.

In its analysis, the IRS estimates the size of the gross tax gap by type of tax, category of error, and degree of information reporting. The largest source of the tax gap is the individual income tax, followed by employment taxes and the corporate income tax. These are also the three largest sources of federal revenues, ranked in the same order by size (Joint Committee on Taxation 2019).

The US Internal Revenue Service (IRS) conducted detailed line-by-line audits of a stratified random sample of roughly 50,000 individual tax returns on a 3-year cycle via its Taxpayer Compliance Measurement Program (TCMP) from 1965 to 1988. These audits yielded an IRS estimate of the taxpayer's "true" income, which when compared to actual reported items allowed the IRS to calculate measures of income tax evasion (e.g., the "tax gap"). The TCMP was replaced by the National Research Program (NRP) in 2001. IRS examiners compared information return documents (W-2 s, 1099s, etc.)

with the actual tax return in order to identify discrepancies and also identify items that appeared large, unusual, or questionable. A tax gap – the amount of taxes legally due but not paid in full and on time – persists at both federal and state levels at about 16% of total taxes due in the USA. The tax gap for 2001 was $345 billion and for 2006 was $450 billion (Congressional documents USA 2012). In 2001, noncompliance took three forms: (1) underreporting ($285 billion – 82% of the tax gap); (2) underpayments ($33 billion – 10% of the tax gap); and (3) non-filing ($27 billion – 8% of the tax gap) (Rifkin 2008).

## Tax Audits and Criminal Investigation

IRS enforcement activities and late payments resulted in an additional $52 billion in tax paid, reducing the net tax gap for the 2008–2010 period to $406 billion per year. The voluntary compliance rate is now estimated at 81.7% compared to the prior estimated rate of 83.1%. After accounting for enforcement and late payments, the net compliance rate is 83.7% (IRS 2016). The IRS targets people who try to evade paying the taxes that they owe.

At the federal level, the IRS conducts two types of audits: correspondence audits and field audits or face-to-face audits. Correspondence audits are primarily generated as a result of information return matches. When the Compliance Center receives Forms 1099s and W-2 s, it matches them with a return. If there is an indication that not all income has been reported, a letter known as CP-2000 will be issued to the taxpayer. This letter requests that the taxpayer explain why particular income items were not reported on his return.

Face-to-face audits are examinations of high-income nonbusiness and business 1040 returns that are given a large score by an automated audit selection system, Discriminate Function System (DIF), and cannot be effectively dealt by a correspondence audit. There are office audits when a taxpayer is summoned to an IRS office for an interview with a tax auditor (or tax compliance officer) and field audits conducted by revenue agents.

In 2015, the IRS indicted only 1,330 taxpayers out of 150 million for legal-source tax evasion (H and R Block 2018). As a result of IRS criminal investigations in 2016, 2699 individuals were sentenced (79.9% of criminal investigations).

IRS Criminal Investigation (CI) is the only federal law enforcement agency with jurisdiction over federal tax crimes. CI was created in 1919 marking its 100-year anniversary in 2019 as a law enforcement agency. CI initiated 2,866 cases in fiscal YR 2018, with traditional cases accounting for 73% of the total and achieving a 91.7% conviction rate for fiscal year 2018 (IRS 2018).

### Cases of US Tax Evasion

The following cases provided examples of tax evasion which are classified under criminal law as US tax evasion.

#### Case 1

Case 1 depicts the downfall of Al Capone, an Italian American gangster who led a crime syndicate dedicated to smuggling, bootlegging, and numerous other crime activities during the Prohibition era of the 1920s and 1930s. Capone was accused of multiple crimes ranging from racketeering to murder and the subject of numerous high-profile investigations. Capone constantly thwarted prosecution attempts including allegations that he orchestrated the well-publicized St. Valentine's Day Massacre of 1929 in Chicago, IL. It was the Internal Revenue Service (IRS) that was able to finally take Capone down.

The IRS looked into Capone's hidden sources of income through crooked ramifications of underworld intrigue. The IRS's best agents were involved in the investigation of Al Capone, led by IRS's Chicago agent Frank J. Wilson that concluded and finalized the investigation. Capone's income was astronomically high; the investigation led by Wilson disclosed that he failed to report large profits from gambling, bootlegging, and various forms of racketeering. After IRS agents finalized their investigation while obtaining large amounts of evidence as

proof the government was ready to arrest Capone. He was brought to trial for tax evasion of income by using aliases, shell companies, offshore tax havens, and secret accounts in 1931. In 1931 Capone was indicted on 22 counts of tax evasion by the US Internal Revenue Service.

### Case 2

Case 2 looks at Walter Anderson, a wealthy telecommunications executive whose money helped underwrite private space exploration efforts, who became infamously known for tax evasion in what federal prosecutors called the largest personal income tax evasion case in the US history (McElhatton 2012). According to a US Tax Court filing (2011), Anderson owes the government nearly a quarter-billion dollars in taxes and penalties spanning the time frame of 1998 and 1999. For the tax year 1998, which was the year Anderson admitted to having earned more than $126 million, he claimed an income of $67,939 on his federal income tax return, for which he had paid only $495 in taxes.

Anderson pleaded guilty to two felony counts of evading federal income tax. The two counts of tax evasion, the first one for filing tax returns in which he failed to report over $126,303,951 of income for tax year 1998 and failure to report over $238,561,316 of income for year 1999 under 26 U.S.C. § 7201 and the second felony count for defrauding the District of Columbia under section 3221(a) of title 22 of the District of Columbia Code (United States Tax Court, 2008). As part of a plea agreement, Anderson admitted to hiding $365 million IRS alleges he paid $126 million; Anderson was sentenced to 9 years of jail time.

### Case 3

Case 3 provides the example when a movie actor Wesley Snipes was involved in tax evasion. In 2008 Snipes was convicted of three misdemeanor counts of failing to file tax returns which he received jail time for, reporting to McKean Federal Correctional Institution in Pennsylvania. On December 9, 2010, Snipes was placed in a Correctional Institution with roughly 290 white-collar inmates (Oldenburg 2013). He completed his sentence at a minimum security called Club Fed and was released in April 2013.

Snipes was convicted of tax evasion for avoiding taxes from 1999 through 2001; he evaded $7 million in taxes by listening to an accountant and anti-tax advocate who claimed "You did not legally have to pay taxes." It was during this time frame Snipes was making about $40 million (1999 to 2004) and not paying taxes. Snipes tax evasion continued over the course of 8 years. During 2013, the IRS made tax assessments dating back more than 8 years:

The IRS tax assessments imposed were:

- 1999 – $177,263.99
- 2001 – $2,573,977.70
- 2002 – $1,497,644.97
- 2003 – $4,576,925.66
- 2004 – $5,625,612.45
- 2005 – $3,526,946.38
- 2006 – $5,777,543.18

Snipes paid off his taxes in 1999 and 2002 as it was requested by the IRS, and he continued to take his case to tax court to seek solace for the remaining amounts owed by offering to pay $842,000 or 4% of the roughly $23.5 million tax debt.

### Case 4

Case 4 presents the case of tax evasion involving major league baseball player and manager for the Cincinnati Reds Peter Rose. In 1989, Commissioner Peter Ueberroth acted upon receiving allegations concerning Rose and announced he would begin an investigation of tax evasion and gambling by Rose; he appointed New York attorney John W. Dowd as special counsel to the case. Rose purportedly failed to report income from autograph and memorabilia sales and gambling wins. Rose pleaded guilty to federal tax evasion charges in 1990 and spent 5 months in prison; yet his troubles didn't stop as he continued to face close to a $1 million lien for unpaid back taxes in 2004.

The concerning facts were if it was determined that Rose bet on baseball, he would risk a 1-year ban; if he bet in connection with the Cincinnati Reds, the team he managed, he risked being banned from baseball for life.

### Case 5

Case 5 is the story of De Sousa, a Baltimore Police Commissioner who resigned after "failure to file" tax return charges were placed against him. The US attorney's office has alleged that De Sousa "willfully failed to file a federal return for tax years 2013, 2014, and 2015."

Federal prosecutors have charged Baltimore Police Commissioner Darryl De Sousa with three misdemeanor counts of failing to file federal taxes drawing an admission from him of wrongdoing (Duncan et al. 2018). In a statement to *The Baltimore Sun*, De Sousa declared "There is no excuse for my failure to fulfill my obligations as a citizen and public official, my only explanation is that I failed to sufficiently prioritize my personal affairs."

De Sousa was a salaried employee of the Baltimore Police Department in each of the three tax years not filed and currently faces up to 1 year in prison and a $25,000 fine for each of the three misdemeanor counts. His initial court appearance has not been scheduled as of late 2018.

### Case 6

Case 6 offers insight into USA Harvest founder, Hugh "Stan" Curtis, who was sentenced by Chief Judge Joseph H. McKinley Jr. in Louisville, KY, to serve 24 months in prison, followed by a 3-year period of supervised release and ordered to pay $183,354 in restitution, announced by the Department of Justice (2014). Restitution to the IRS will be handled independently by the civil division of the IRS, and the amount owed in taxes will be calculated independently by the IRS. Curtis pleaded guilty in US District Court in Louisville to a to a seven-count federal indictment charging him with mail fraud, money laundering, and filing false income tax returns with the Internal Revenue Service (IRS) on July 3, 2014 (Department of Justice 2014).

"As founder and sole officer of USA Harvest, Stan Curtis occupied a position of significant responsibility and trust. He abused that trust by diverting charitable donations intended for the poor and hungry," stated by US Attorney Hale. "Curtis will spend 24 months in prison and has been ordered to pay back the $187,354 that he stole from the foundation and used for his own personal benefit" (Department of Justice 2014).

## Conclusions

Tax administration has several tools to encourage voluntary tax compliance and enforce taxes in its arsenal. The most prominent of such tools are tax audits. By auditing taxpayer records, tax administrators detect taxpayers who fail to fulfill their tax obligations and impose penalties and fines. The effective audit programs induce voluntary tax compliance. The IRS uses tax audits as a way to detect and penalize noncompliant taxpayers, first using tax administration to encourage voluntary tax compliance and enforce taxes.

A taxpayer's perceived probability of audit is an important component of the taxpayer's decision to comply with a requirement to pay tax (Chirico et al. 2016). To the extent that actual audit rates affect taxpayer perceptions, actual audit rates may be an important deterrent to noncompliance. In addition to the effect of perceived probability of audit, there is a specific deterrence effect of audits on the audited. Individuals generally appear to alter their perceived probability of audit upward in the few years following an actual audit, increasing reported wages, self-employment income, and other types of income for 3–4 years following the audit (DeBacker et al. 2015).

# Tax Expenditures as Social Policy

Meg Streams and Laurie Gavilo-Lane
Department of Public Administration, Tennessee State University, Nashville, TN, USA

## Synonyms

Revenue-side social program; Tax preference for social welfare

## Definition

A tax expenditure intended as social policy is here defined as the amount by which a jurisdiction voluntarily foregoes revenue otherwise owed by a set of taxpaying units via provisions in the tax code, which define the set by specifying criteria to be met by those units; the tax expenditure is explicitly rationalized by appeal to a social end rather than a basic principle of taxation or other government objective. There are variations in the specific definitions of the "tax expenditure" concept across analysts and countries, as well as in what is considered as a "social" end.

## Introduction

The general concept of tax expenditure has received extensive attention from analysts, scholars of public finance and economics, policymakers, and advocates of tax reform since being brought to the fore as a reform issue by Surrey (1970, 1973). Normative principles focused on efficiency in taxation emphasize application of a tax instrument to a base which is as broad as possible, thus allowing rates to be kept as low as possible while meeting the government's revenue requirement – and reducing the extent to which taxpaying unit behavior is distorted. Tax expenditures deviate from that theoretical goal,

because by definition they represent base *narrowing* in some way. Creation and maintenance of a tax expenditure may generate a clientele, which will defend its continued existence and potentially lobby for expansion. Narrowly defined tax preferences for targeted industries, for example, are often perceived as the outcome of special-interest politics, frustrating to the reformer yet as difficult to eradicate as any other adopted policy that benefits a group with the resources to oppose its elimination.

However, revenue policies of developed nations also typically contain many tax expenditures rationalized by goals that are overtly social in nature and whose beneficiaries comprise a larger segment of society. These tax expenditures have in some cases developed into large-scale social policies operating nearly entirely on the revenue side, such as the Earned Income Tax Credit (EITC) in the US federal personal income tax code (Eissa and Hoynes 2011). Designed in theory to assist poor households while simultaneously rewarding (or at least not overtly penalizing) work effort to the extent of some traditional forms of expenditure-side welfare policy, the EITC is often touted as a successful social program, despite or even because of its tax expenditure format. To supporters, the tax expenditure form allows the program to achieve desirable redistributive ends without the negative impacts of expanding special-purpose government bureaucracy. To others, the risks of obscuring the nature and cost of any government program via the complex and nontransparent provisions of the tax code rather than through the expenditure side of the budget process outweigh the benefits of the tax expenditure approach. Therefore, socially oriented tax expenditures can be seen as obstacles to tax system simplification and efficiency, leading to calls for reform (even apart from judgments regarding appropriateness of the social goal itself). Tax expenditure implementation, to the extent that it adds criteria to be met and documented by filers, also adds to the processing and auditing load of the revenue collection agency charged with making determinations of accuracy and validity regarding recipient claims. Hence, tax expenditures are often seen as violating the goal of administrative simplicity in taxation. While some types of tax expenditures that exclude a portion of the tax base that would otherwise require greater filing detail can be seen as improving administrative simplicity, social-goal tax expenditures often will not fall into that category. Ensuring eligibility is an essential part of the targeting implicit in the social program and must occur whether it is implemented on the revenue or expenditure side.

## Scope of Entry

Given the scale of the topic, this entry focuses specifically on explaining how tax expenditure policy provisions can be seen as revenue-side alternatives to expenditure-side social programs, which operate through statutory entitlement by formula or via the annual appropriations process. Design considerations are addressed along with some political dimensions of the use of tax expenditures for social ends. An overview of selected major examples of tax expenditures for social ends is presented, and the entry closes with a note on fiscal federalism/intergovernmental dimensions of tax expenditures for social policy.

The primary emphasis throughout will be conceptual with illustrations from US income tax policy, though the construct of tax expenditure for social ends is applicable in international settings as well (e.g., profiles of tax expenditures in ten higher-income nations included in Organisation for Economic Co-operation and Development (2010); tax expenditure reporting status reviewed for 36 high-, middle-, and low-income nations in Burton and Stewart (2011)). While issues of inefficiency and inequity will be included, the larger topic of structural reform of tax systems lies outside the scope of this entry. The tax expenditure concept is not intrinsically restricted to income taxes alone (as opposed to excise, property, or other types of tax instruments); nonetheless, income tax is the most common focus of its application and will be emphasized here. Furthermore, the precise categorization of which government functions or

objectives counts as "social policy" in the tax expenditure context is not always a matter of consensus, even within a single country (see discussion in Howard (1997)). Therefore, while some examples of policies that are generally understood as socially oriented tax expenditures, such as the US EITC, are included here, no attempt is made to exhaustively describe or account for the overall impact of social policy tax expenditures.

## Challenges of Measurement

In any discussion of the tax expenditure concept, it must be recognized that measurement and estimation of impact are not straightforward. The quantification of the budgetary impact of specific tax expenditures remains an active area of both academic research and practical policy analysis (Altshuler and Dietz 2011; Burman et al. 2008). Of course, such an estimate is bound to a particular jurisdiction's tax system at a particular point in time and is based on a variety of assumptions. To identify a tax expenditure and estimate its revenue impact were the enabling provision in the tax code eliminated, it is first necessary to establish the version of the tax structure to be used as the fundamental point of reference. Conceptions among analysts of what should constitute the underlying broad-based tax structure, from which standpoint the departure can be defined, can vary substantially regardless of whether their analytical lens is tax law or economic principles. Indeed, even the legislative and executive branch entities in the US national government that produce an annual estimation of federal tax expenditures do not use identical versions of the income tax structure as their point of departure (Joint Committee on Taxation of the Congress of the United States 2016; United States Office of Management and Budget 2016), and the list of tax expenditures they identify varies somewhat (for a discussion of differences, see Altshuler and Dietz 2011). This definitional variation both within and outside government sources is not simply due to lack of information or uncertainty per se, but rather arises from fundamental differences in agreement of what constitutes the appropriate model for an ideal tax system and in what ways that ideal can best be approximated by selected fundamental elements of an existing tax system – questions which are unlikely to be fully settled. The politically charged nature of labeling particular tax code provisions as tax expenditures also may influence variation between classifications internal and external to a government, given that the concept is often associated with perceived inefficiency, lack of transparency, and need for reform.

Estimating the cumulative impact of tax expenditures is not straightforward, because eliminating one may influence the scope of another. For example, if a particular tax expenditure provision is eliminated, as the taxable base increases for former claimants, some may be shifted into an income bracket subject to a different marginal rate of tax and may become thereby newly eligible, or ineligible, for some other kind of tax expenditure. More subtly still, taxation by its economic nature changes the relative prices of different types of taxed and untaxed activities, impacting the decisions of taxpaying units through the incentives it creates. A change to one element of the tax code alters the existing balance of costs and benefits, and it can be expected that behavior at the microlevel will shift in response with an effect on revenue outcomes. Society-wide, the cumulative effect of behavioral changes can alter macroeconomic outcomes as well. When those changes in the economy flow back through the revenue collection structure, yet additional effects on the revenue collected can result – all from elimination of a single tax expenditure provision. Neither of these latter two issues are taken into account in the estimates of tax expenditures published by the Office of Management and Budget (OMB) and the Joint Committee on Taxation of the US Congress (JCT), though scholars have attempted to address these and other complexities through analysis and simulation (e.g., Burman et al. 2008). Thus, an emphasis on conceptual elements rather than estimates of fiscal scale for socially-oriented tax expenditures is maintained here. With challenges of definition and estimation, the tax expenditure concept and its role in social policy are a continuing topic of debate and analysis on tax and spending behavior across countries and therefore are relevant to those interested in public policy and administration.

## Tax Expenditures as Substitutes for Traditional Expenditure-Side Social Programs

In the public finance literature, tax expenditures have come to be understood as a kind of parallel mechanism for policy implementation and as an alternative to the establishment of expenditure-side bureaucracies (Toder 2000). Creation of a traditional bureau-based social program entails, through the combined operation of the policy process including statutory and regulatory dimensions, at least the following:

1. The definition of a social goal argued to be amenable to government action through a public program.
2. Determination of the nature of the policy treatment (such as a payment or voucher) to be offered to a specified class or classes of beneficiaries through the program.
3. Definition of the criteria by which individuals, households, or organizations will be classified as beneficiaries of the new program.
4. Specification of the relationship between the result of beneficiaries' evaluation on the criteria and the type, scale, and duration of the policy treatment to be received (e.g., as crystallized in a statutory entitlement formula).
5. Identification of either an existing, or establishment of a new, bureaucratic entity or entities charged with certifying eligibility of potential beneficiaries, administration of the specified social program benefits to those individuals (possibly aggregated as households or organizations), and monitoring to limit benefits fraud.

In order to be enshrined in the tax code, a tax expenditure would still require choices to be made regarding (1) through (4) above. At (5), however, the revenue-side social policy (i.e., the policy administered through the tax collection system, focused on sources of funds) diverges from the traditional expenditure-side social policy (i.e., the policy administered through the spending side of the budgetary process, focused on uses of funds). Rather than the establishment of a new executive branch bureau for implementation of the policy, the existing agency responsible for revenue collection is charged with policy implementation.

Examples of other variations between tax expenditures and same-purpose social spending programs may relate to the relative emphasis on qualifying beneficiaries in advance (expenditure side) vs. post hoc verification/audit of claimants (revenue side) or whether the tax expenditure functions more like an expenditure-side entitlement with the total amount "spent" (i.e., revenues foregone) varying based solely on eligibility criteria and filer behavior and demographics or more like an expenditure-side appropriations program with the total amount spent determined annually through the budget process; yet in each of these potential differences, it is still possible to find examples of tax expenditures that fall into the pattern normally associated with the expenditure-side social programs (Toder 2000). The design of a tax expenditure for social policy, therefore, in theory may be made arbitrarily similar to the design of a social spending program. Nonetheless, one area of concern for social policies enacted through the tax code – particularly for policies aimed at poverty reduction – is the annual focus of the tax cycle. A typical tax expenditure has its impact for the taxpaying unit after the end of the fiscal year, after tax return filing and processing are complete. If the result is to increase the amount of a refund due, it will be issued to the filer at that point. Many have observed that for income- and credit-constrained households, this annual lump-sum pattern may be less beneficial than an expenditure-side traditional benefit program that could pay benefits monthly or on another schedule. For example, the lump-sum annual refund and EITC formula may in fact create a disincentive for individuals to save (Weber 2016).

Given this stylized overview, competing appeals to simplicity arise in discussions of tax expenditures as mechanisms for social policy. On the one hand, in light of the principle of administrative simplicity in revenue generation, the implementation, compliance, and enforcement costs of adding rules governing tax liability and payment could be seen as lowering the efficiency of the tax structure. On the other hand, establishment of new agencies for each social program is seen by those concerned by public sector growth

as potentially wasteful, and therefore the relative "simplicity" of operating such a policy through a pre-existing, general-purpose revenue collection mechanism with which nearly all households have potential interaction is seen as advantageous – particularly if the eligibility criteria for the program would involve measuring the recipient's level of the base of taxation anyway (e.g., income). Some complications to this latter argument arise when the nature of a social program administered as a tax expenditure is such that its beneficiaries would not necessarily interact directly with the tax collection system in the absence of the policy. An example can be seen in the US Federal EITC mentioned above, as potential beneficiaries do not always have enough personal income to owe a tax liability for a given fiscal year. Therefore, if they do not recognize the potential to receive a benefit from the EITC provision in the tax code, they may not file their federal return. In fact, it is estimated that a nontrivial proportion of households that are otherwise eligible for the EITC benefit do not file and thus lose the potential benefit. So the simplicity derived from the assumption that the tax apparatus of a society will typically reach all potentially eligible households is not necessarily fully realized.

## Designing Tax Expenditures for Social Policy

Once the decision has been made to utilize a tax expenditure approach for a social programmatic goal, an additional element (not relevant in the establishment of an expenditure-side social program) must be defined. That is, how will the tax expenditure provision be designed as a modification of the final tax liability of a household? There are multiple approaches. Fundamentally, a tax *liability* arises from the application of a tax *rate* to a tax *base*. Primary categories of tax expenditure policies operate through reduction of the base (*exclusions*, *exemptions*, and *deductions*); reduction of the rate otherwise applicable; reduction of the resulting tax liability directly, dollar for dollar (*credit*); or *deferral* of the tax liability. Of particular interest is the distinction between deductions and credits and between refundable and nonrefundable credits. A deduction permits the income subject to taxation to be reduced by some amount, either fixed by the policy or dependent on the behavior of the taxpaying household. For example, a US household that elects to itemize deductions rather than take the standard deduction (which does not require the additional filing detail and recordkeeping expected of "itemizers") is permitted to deduct charitable contributions recorded during the tax year. Some deductions are "above the line" (included in the calculation of adjusted gross income), meaning that even those taking the standard deduction may still make use of them; a US example is the deductibility of student loan interest paid during the tax year. Because deductions are taken off the base rather than off the tax bill itself, the amount of the benefit to the taxpaying household is dependent on the marginal rate of taxation to which the household is subject to given its income (that is to say, the rate assessed on the next currency unit of income earned given the amount of income already earned that tax year and the rate structure in place). As the US federal personal income tax has a progressive rate structure, households with higher incomes fall into higher tax brackets (until the highest bracket is reached). A household falling into a higher tax bracket receives a reduction in the tax liability equal to the deducted amount multiplied by the marginal rate applied at that income range. To the degree resulting from the progressivity of the tax structure, this means higher-income households derive a larger amount of reduction in tax liability from a deduction than do lower-income households.

The presence of a standard deduction in the US system potentially accentuates this differential benefit of deductions further. If there is an error in a filer's understanding or calculation of whether the benefit of itemized deductions would exceed the benefit of claiming the standard deduction in a given year, and the taxpayer decides to take the standard deduction, then the household will not benefit from the deductions available only to itemizers. Itemizing households tend to be wealthier on average, so this issue is a concern in terms

of (1) vertical equity, the principle of taxation which holds that households situated differently with respect to the base of taxation should be treated differently, and (2) the emphasis on ability to pay as a criterion for fair taxation. If similarly situated households differ in itemizing behavior via error or lack of understanding, horizontal equity is reduced as well (the principle of treating similarly situated households in a similar fashion with respect to tax liability).

In contrast, a tax credit design creates less differential treatment in theory because the amount of the credit received, as a "dollar for dollar" reduction in the tax *bill* rather than the *base*, will not depend on the taxpaying unit's tax bracket. An important additional issue, however, is that a credit may be defined as "refundable" or "nonrefundable." The more common nonrefundable design means that the credit reduces the household's tax liability by the maximum allowable amount of the credit, unless the liability is less than that upper bound, in which case the liability is zero after application of the credit. That is, a household with a tax liability smaller than the amount of a nonrefundable credit only receives a benefit equal to the amount of existing liability (which will be less than the credit maximum as defined in the tax code). In contrast, a refundable credit is more generous. If the household's liability is in excess of the credit amount, the refundable credit acts the same way as the nonrefundable credit, and the liability is simply reduced by the full credit amount. On the other hand, if the liability of the household is *less* than the refundable credit amount, the household actually receives the difference as a payment. Therefore, unlike a nonrefundable credit, the amount of a refundable credit received does not differ among households based on existing tax liability if they otherwise meet the same eligibility criteria. The EITC provides an example of a refundable credit, and this element of its design is a key to its major impact as a poverty-reducing program (Eissa and Hoynes 2011). Because the EITC is a *refundable* credit targeted to working poor households, many of which have little or no income tax liability, government expenditure on this program is made up not only of revenues foregone (as would be the case with a nonrefundable credit) but also of outlays; this latter component is the dominant component of the overall cost estimate of the EITC (Eissa and Hoynes 2011). Another example of a refundable credit, though temporary and required to be repaid under certain conditions, was the US first-time homebuyer credit initiated as a policy measure to stimulate the housing market in the period of the recession and its wake (2008–2010). Refundable credits are generally argued to be more generous and to make tax expenditures behave more like regular expenditure-side programs, whether that is considered desirable or not.

## Examples of Tax Expenditures for Social Policy

Given these varieties of design options for tax expenditures, examples of US tax expenditures for social policy ends include deductibility of charitable contributions; the Earned Income Tax Credit; exclusion of various types of pension contributions and retirement savings; exclusion of employer contributions for medical insurance premiums and medical care; exclusion of employee premiums on certain life, accident, and disability insurance; a wide variety of deductions and credits related to education, training, and employment; exclusion of employer-provided childcare benefits; and deductions for the blind and elderly (a non-exhaustive list; see U.S. OMB 2016; JCT, U.S. Congress 2016). Of the top five largest estimated income tax expenditures in projected revenue effect according to the US Office of Management and Budget for Fiscal Year 2017, the largest is a socially-oriented tax expenditure: the exclusion of employer contributions for medical insurance premiums and medical care (subsidizing a particular type of compensation/healthcare expenditure). Deductibility of mortgage interest on owner-occupied homes (subsidizing home ownership) and exclusion of defined-contribution employer plan contribution and earnings (subsidizing a particular type of compensation/retirement savings) are also among the top five (United States Office of Management and Budget 2016, p. 243).

## Political Dimensions of Tax Expenditures for Social Ends

Emphasis on fiscal stringency in the wake of the 2008–2009 global recession has heightened the attention given to public finance. Government operations at all levels and across borders are subject to critique with respect to the extent and efficiency of resource extraction from the private sector as well as the efficiency, scale, and effectiveness of fiscal, monetary, and regulatory policy. Pressure to curb expenditure-side programs may incentivize governments to seek program goals via foregone revenues instead, either to limit political conflict or external scrutiny by adding to already Byzantine tax codes or to reap the political advantages of labeling a "tax cut" what is actually functionally equivalent to a targeted spending program (Howard 1997; Toder 2000). This pressure may be even more acute for programs geared toward social goals than for other types of policies. It is often argued that if existing tax expenditure policies were widely understood and presented to the public as equivalently complex spending programs, they would not be supported in the same form. Slemrod and Bakija (2008, pp. 169–170) provide an illustrative example using deductibility of state and local taxes paid under the US federal personal income tax law (for itemizing households); similar arguments are possible for more explicitly socially-oriented tax expenditures.

As mentioned above, the fact that a new bureau is not established to operate a social program can be marketed as an additional advantage. Public perception about the desirability of a proposed social program may differ depending on whether it is presented as a tax expenditure versus a traditional spending program, with tax expenditure-style "framing" being viewed more positively (e.g., the experimental results of Faricy and Ellis 2013). Advocacy for a given tax expenditure in the social policy arena may sometimes arise more from third-party entities involved in provision of the subsidized service or good than from actual direct beneficiaries (Howard 1997). Estimates that cumulatively tax expenditures may actually have a regressive impact (i.e., benefit higher-income taxpayers more than lower-income taxpayers; Burman et al. 2008) generate concern regarding equity effects. Those equity implications may be obscured by the use of the tax code rather than the annual budget process (appropriations) or statute formula (entitlements) as the implementing mechanism. The lack of transparency involved and the differential political effects have led to the characterization of tax expenditures for social policy in the US system as a "hidden welfare state" (Howard 1997).

## Fiscal Federalism and Intergovernmental Implications of Social Policy Tax Expenditures

Tax expenditure policy for social ends is most frequently examined at the national level in the US case, with reference to the federal personal income tax code. There are logical reasons for this focus including its political saliency, the vast scale of revenue collections at that level, and the progressive bracket structure of the personal income tax, highlighting the risk of lowered progressivity and heightened income inequality when tax expenditures that favor higher-income groups are introduced (particularly in the form of deductions).

Nonetheless, tax expenditures for social purposes also exist at the subnational level. Indeed, from the point of view of lower-level governments, although the scale of the revenues foregone is small in comparison with central government tax expenditures, the amount may still be notable with respect to the subnational unit's own-source revenue and expenditure patterns. Policy choices to establish, maintain, or terminate the tax expenditure must still be made, and a class of beneficiaries once created at the subnational level will still resist alteration of the policy once established. While tax expenditure budget preparation has spread among the US state governments, for example, the extent to

which the information within these documents is serving as a guide to policy improvement may be limited (particularly for non-income tax instruments such as retail sales tax; Mikesell 2011). Interaction between federal, state, and even local policies may result from tax expenditures for social goals. The EITC provides a case in point. A number of US states have adopted their own earned income tax credits, which typically require that potential beneficiaries first apply for the federal EITC by filing a federal tax return, thereby encouraging the flow of these outside revenues for social welfare purposes to the state's poorer working residents.

## Conclusion

The definition, measurement, and effects of tax expenditures for social policy will continue to be debated inside and outside government. It is important that scholars and students of public policy and administration recognize that this avenue for social programs not only exists but is heavily utilized. The "bright line" dividing the revenue side with its focus on sources of funds, and the expenditure side with its focus on the use of funds, is not an impermeable barrier. Policy in pursuit of social goals can be implemented on either or both sides of the line, and there may be important distinctions in the degree of the public's understanding of policy when it is located on the revenue side of the border. Greater transparency and accountability in public finance must include continued attention to tax expenditure adoption and reporting, and scholars of public policy should continue to devote attention to social action built into tax codes as well as appropriations bills and entitlement statutes.

## Synonyms

Accountability; Good governance; Involuntary contribution; Public revenue; Representation

## Definition

Tax is a compulsory contribution imposed by a public authority. It is a payment which does not guarantee an exact amount of services to be rendered to the taxpayer in return. Governance, on the other hand, refers to the quality of governing usually characterized by accountability, transparency, fairness, participation, and responsiveness, among others.

## Introduction

The inevitability of taxes in human life has never been better expressed than by the popular aphorism of Benjamin Franklin that compared it with death. But unlike death, the other inevitable is not merely a personal experience; it has been indissolubly associated with the evolution of human civilizations. Raising revenue to finance government expenditure is the traditional function of taxation; it also plays an important role in the distribution of income and wealth and in economic stabilization (Musgrave and Musgrave 1989). Yet another equally important but often overlooked function of taxation is representation and state-building (Brautigam 2008). In contrast to its traditional role of revenue which has dominated tax literature until 1980s, the role of taxation in state-building has recently captured the attention of analysts who consider taxation as a political process through which citizens can demand accountability and good governance. They argue that taxation holds potentials to generate "governance dividend" in the form of improved accountability, responsiveness, and state capacity (Moore 2002). Known as the new fiscal sociological approach, it sees taxation as binding a contract between the state and its citizens and engaging the latter in a revenue bargain. In such a bargain, the citizens accept and comply with taxes in exchange for influence on public policy, effective provision of services, and enhanced accountability, among others. The bargain is mutually beneficial as the citizens receive improved services and governance while the government receives larger, more predictable, and easily collected revenue (Levi 1989). Since this bargain entails principles of good governance such as participation, transparency, and accountability required to improve mutual trust between taxpayers and the government, taxation and governance play a complementary role. This chapter unpacks the complex relationship between taxation and governance by explaining the nature of interface between the taxpayers and tax authorities and by comparing taxation with other sources of the state revenue.

## Taxation and Governance: Understanding Interdependent Relationship

The changing views and interpretations of tax over the ages reflect changes to people's attitude toward taxation and its place in societal relationships. Definitions such as "one sided transfers [ ] for meeting the expenses of government" (Ely 1888: 6–7, cited in Martin et al. 2009) or "unrequited, compulsory payments collected primarily by central governments" (World Bank 1988: 79) underscore the revenue function of taxes. On the other hand, the benefit or reciprocity aspect becomes prominent when tax is considered as something "we pay for the civilized society," as maintained by Justice Oliver Wendel Holmes Jr. (cited in Cordes et al. 2005: xv). The transition of tax from "unrequited

payment" to an instrument of reciprocal relationship between the state and its citizens is significant to understand the relationship between taxation and governance.

Taxation provides invaluable insights into how individuals relate to one another, to the government, and to the broader society. Paying taxes thus goes far beyond a personal experience as sociopolitical conditions influence tax compliance. Drawing on the history of taxation, Martin et al. (2009: 3) maintain that taxation provides fungible resources to the state as well as establishes one of the most widely and persistently experienced relationships that individuals have with their government. The ancient Indian epic poet Kalidasa touches upon the reciprocity of the relationship that taxes entail when he maintains that "the king receives taxes from his subjects only for the promotion of their welfare as the sun draws moisture from the earth to return it a thousand-fold in the shape of rain" (Kale 1922: Canto 1, verse 18). Multiplicity of this relationship transforms taxation from a monetary contribution into a social contract (Moore 2008). This is more so in the modern society than it used to be in the past. Tilly (2009: xii) highlights this by asking some fundamental questions about taxation: "How does tax compliance ever come about?" or "How do regimes compel or cajole their citizens to yield resources repeatedly?" The argument that underpins these questions is that taxation essentially involves a social and political process. Clearly, the "how" aspect of taxation is more insightful than its "what" dimension. This enables us to see taxation as a process rather than an end and makes the politics of taxation as overarching an issue as its economics. With this in mind, we will attempt to establish the relationship between governance and taxation drawing on three perspectives: taxation evolving as a social contract between the state and the citizen, taxation as a collective action problem, and taxation as embodying the continuum of coercion and persuasion.

## Taxation as a Social Contract

In an insightful analysis of taxation and the evolution of civilizations, Adams (2001) shows with examples and anecdotes how the vicissitudes of the great ancient and modern civilizations were tied to various aspects of taxation. He demonstrates how tax has remained an ever-present subject in the relations between the state and its citizens throughout civilizations spanning from the Egyptian, the Greek, and Roman eras through the British Civil War, the American and French Revolutions, to the modern days:

> The three roots of modern civilization – ancient Greece, Rome, and Israel – involve histories filled with drama centered on taxation. The biblical God, who repeatedly chastised his chosen people, selected taxation as his rod. (Adams 2001: xxii)

Based on the premise that depending on how a tax is devised and managed, it can be used for good or for evil, he emphasizes fair taxation and urgency on the relationship between the state and its citizens, as he draws an analogy between the tax and fire: "When we tax we are dealing with fire, and without proper controls and care, we can easily burn down everything we have built, and our hopes for a better world can go up in smoke" (Adams 2001: 3). It is believed that the transition from rulers' fiscal dependence on income from their own properties to general taxation gave rise to the tax state. What is important in this societal process is how taxation started as a coercive tool to extract a one-sided contribution from the citizens and, with the passage of time, evolved into a powerful instrument for bargain known as the "revenue bargain" (Moore 2008). In the past such revenue bargains were triggered primarily by interstate war-driven imperatives. On the other hand, the compelling demand for economic growth is now used to justify the need for more revenue. If one considers "war" as a metaphor, as is often used in describing a challenge, it is now the war against poverty and underdevelopment that prompts maximization of revenue especially in the developing world.

## Collective Action Problem: Coercion and Contract

Taxation is seen as a collective action problem as rulers try to maximize revenue while the ruled try to minimize it (Levi 1989). Given this paradox, a key question that has kept tax researchers

and analysts preoccupied is how the overarching goal of revenue generation can be achieved by mitigating the collective action problem.

Drawing on the history of taxation of the Republican Rome, medieval and renaissance France and England, eighteenth-century Britain, and the Commonwealth of Australia, Levi (1989: 3) presents a hypothesis that "rulers are predatory in that they try to extract as much revenue as they can from the population." An ancient Egyptian cartoon drawing shows the tax officials of the pharaoh snooping, inspecting, and recording everywhere, even surveying the nests of pigeons to count the eggs to make sure that the pharaoh received the tax due to him (Adams 2001: 8). The visual imagery of "plucking the goose as to obtain the largest amount of feathers with the least amount of hissing" depicts the ingrained juxtaposition of coercion and persuasion in taxation that has found numerous manifestations in the literature through ages. The interplay of coercion and contract that the tax continuum involves has evolved into a revenue bargain between the ruler and the ruled for their mutual benefit. The citizens and taxpayers comply with taxes in exchange of some influence over the level and form of taxation and how the tax revenue is utilized. The government receives what it expects: ease and predictability of generating sizeable amount of revenue. One can find clear and observable indicators of revenue bargains between the state and the taxpayers in modern states. These include the presence of revenue issues on the public policy agenda; collective action by groups of taxpayers around tax issues through electoral or other channels of representation; and the willingness of the government to interact with and respond to taxpayers' expressed or anticipated preferences in the public policy-making process (Moore 2008).

The close relationship between taxation and governance could be understood better when one considers taxation against two other financing tools, namely, aid and nontax revenue.

## Taxation, Aid and Accountability

Moore argues that "the greater the dependence of the state on earned income, the more likely are the state-society relations characterized by accountability, responsiveness and democracy" (2002: 85). On the other hand, aid dependence makes the recipients hostage to donors' conditionalities which limit their capability to focus on their own priorities. It also restricts citizens and legislatures to exercise effective control over the ways in which these states raise and spend money. Given that the influence of citizens over state revenue and expenditure lies at the heart of effective democracy, Moore argues that though official aid donors try to promote the values of democracy and good governance, paradoxically aid interventions undermine them. The argument extends to other unearned income such as income from natural resources. By paying taxes, a citizen acquires some rights to demand accountability from those responsible for making particular decisions on their behalf. On the other hand, the exogenous rents, such as oil or gas, relieve social pressure that might otherwise lead to demands for greater accountability (World Bank 2003). Evidence from the oil-rich countries of the Middle East and North Africa that do not tax their citizens much supports this line of argument (Choudhry 1997).

## Taxation and Corruption

The association of corruption with taxation seems almost archetypal as the image of a tax collector as a corrupt person has been usually encoded in different cultures over a long period of time. In an Italian folktale, tax collectors have been equated with thieves in the following manner: "'Stealing is a sin,' said the priest, 'unless you steal from thieves.' 'We steal,' explained the thieves, 'but we are not committing a sin, because we rob the tax collectors'" (Calvino 1982: 40). Recent empirical evidence shows that countries with a high level of corruption tend to have lower collection of tax revenue as percentage of GDP (Tanzi and Davoodi 2000). Corruption in tax administrations particularly in developing countries is often attributed to their complex tax and trade regimes including multiple discretionary exemptions, confusing and nontransparent procedures for tax compliance, and excessive discretionary power of tax

inspectors. When Klitgaard's (1988) framework (corruption equals monopoly plus discretion minus accountability) is applied, it is obvious that there are both incentives and opportunities for tax officials to engage in corrupt practices. The expected gains from corrupt behavior increase with the increase of monopoly and discretionary power. By contrast, lowering the levels of accountability and transparency reduces the cost of tax official's engaging in corruption. Corruption in tax departments not only means the loss of state revenue; among others, it reduces voluntary compliance with tax laws and regulations, demoralizes honest taxpayers, and creates an atmosphere of cynicism.

### Fair Taxation Versus Good Governance

Efforts to overcome the challenges posed by the paradoxical relationship of coercion and persuasion and the relative vulnerability of tax collectors to corruption gave birth to the idea of fair taxation. Academically, it started with the classical economist Adam Smith's maxims of good taxation: convenience, simplicity, cost-effectiveness, equity, and neutrality. Interestingly, Kautilya, a fourth-century BC Indian scholar, advocated a fair and efficient system of taxation which would advance the wealth as well as well-being of the realm – a tax system which would supply the king with tax revenue while not stifling economic growth. His figurative reference to plucking flowers without destroying the roots implies the emphasis placed on the enabling environment for taxation as well as the citizen's ability to pay. Contemporary writers like Musgrave and Musgrave (1989) underscored the imperative for fair and non-arbitrary administration. It is relevant to note that most of the criteria devised by economists for a fair tax system are in essence the principles of good governance.

### Governance and Tax Compliance

The relationship between taxation and governance ultimately rests on the compliance covenant which is characterized by reciprocal transparency, understanding, and trust in the relationship between taxpayer and the tax administration. As there is a direct relationship between the degree of tax compliance and the collection of revenue, creating a cost-effective compliance system is vital. Levi argues that rulers can make compliance cost-effective by promoting institutions and structures. While she admits the existence of what she calls "ideological compliance" – compliance out of moral obligation – she prefers "quasi-voluntary compliance." In her own words: "It is *voluntary* because taxpayers choose to pay. It is *quasi*-voluntary (italics in original) because non-compliants are subject to coercion, if they are caught" (Levi 1989: 52).

Levi's notion of quasi-voluntary compliance is also reflected in Kirchler's (2007) tax compliance model, at the heart of which is the mutual trust between taxpayers and the tax authorities. He says, "Trust is a critical factor in understanding the origins of civic engagement, cooperation with authorities and compliance. . .tax authorities' orientation towards taxpayers and their interaction style create a tax climate which fosters either resistance and individual profit maximization or taxpayers' trust in the authorities and the perceived legitimacy of authorities" (Kirchler 2007: 202). That is, the level of compliance is largely determined by the climate of interaction characterized by citizens' trust in authorities. In other words, the efficiency of a tax system hinges on the extent to which taxpayers "volunteer" to comply. Referring to the free-rider problem, he concludes that the level of voluntary compliance can be enhanced by improving governmental performance as well as by winning the trust of its people. This reminds us of the "psychological contract" (between taxpayers and tax collectors) which is obeyed not for the fear of sanction but for the mutual trust between the actors. The revenue bargain creates a climate conducive to better tax compliance. Needless to say that only a transparent and participatory environment can prompt such a revenue bargain.

## Conclusion

The above discussions highlight a number of important aspects of the linkage between

taxation and governance. It is obvious that tax is more than a monetary contribution that citizens make to the state; it is a tool for representation, accountability, and participation. It also serves as a mechanism to forge a relationship between the state and its citizens – a relationship of reciprocity characterized by mutual trust and cooperation which in turn helps to sustain tax compliance. Taxation also involves a revenue bargain between the state and its citizens, a bargain that is mutually beneficial on both sides. The government gets what it wants (higher compliance leading to increased revenue), and the citizens get the opportunity to engage politically. Citizens and taxpayers comply with taxes in exchange for influence over the level and form of taxation and the use of such revenue. Thus, taxation gives the citizens the handle to hold the government accountable and to demand transparency and responsiveness. The government in turn needs, in addition to developing an efficient system of bureaucracy, to respond to citizens' demands to sustain state revenue. Thus taxation and good governance complement and reinforce each other.

While there are a number of overlapping claims, it must be noted that the relationship between taxation and governance is not automatic. Much would depend on who is taxed, how is tax collected, and a wide variety of contextual variables. In situations where tax is levied coercively, it may damage the state-society relations thus reinforcing poor governance. Therefore it is asserted that taxation contributes to governance only when it is transparent and fair, accountable, and participatory in nature. Such features are critical for securing representation and for strengthening state-society relations. When tax system is geared with revenue maximization as the sole agenda, its representational role is virtually overlooked. This often leads to lack of or near absence of revenue bargain, i.e., negotiations between the state and society considered critical for a tax system to generate governance dividends. By implication this suggests that the governments seeking to improve governance through taxation must move beyond such a narrow perspective of taxation and consider ways for securing negotiations with citizens in tax matters. When the same logic is applied in different contexts, it is important to analyze and understand what makes taxation as a tool for governance and state-building in advanced economies. In this regard the Australian experience is instructive. The Australian government took stakeholders in confidence with its slogan "no new tax but new tax system" when it introduced the GST in 1998 (Brown 1999). Likewise, the guiding principle "as tax systems are adjusted, the community needs to be educated, persuaded and encouraged to cooperate, long after the vote is cast at the ballot box," as followed in Australia, serves as a useful reminder on how to secure tax payers' cooperation and compliance.

## Synonyms

Advocacy coalition; Coalitions; Hurting stalemate; Taxation policy; Value-added tax

## Definition

Taxation: Taxation denotes a strategy by which governments raise money to undertake development projects and other government programs.

Policymaking: Policymaking suggests the making of laws or the setting of standards to regulate and provide direction for public policy.

## Introduction

This entry investigates the value-added tax policy change in Ghana by analyzing how the public influenced shifts in the original tax instrument. Using Sabatierâ€™s advocacy coalition framework, this entry argues that the adoption of low tax rate in the revised VAT was the result of a hurting stalemate and negotiated agreements in the 1996 multiparty parliament. The diachronic case study method is employed in studying the policyâ€™s initial abortive phase and the re-formation process. Basic empirical data is collected from reports of the media and NGOs. It is found that the low tax rate was largely a compromised position on the core beliefs of two coalitions: the Alliance for Change and the Cadres coalitions. It concludes that inclusion, participation, consensus-building, and compromise are indispensable in democratic policymaking since it is a political process that distributes benefits and burdens to the people.

In 1998, Ghana's tax policy experienced a landmark shift as the country adopted the value-added tax (VAT) policy after an initial attempt to implement same in 1995 dramatically failed largely due to the nature of the political regime as the ruling government adopted a posture of not listening to the concerns of organized labor and opposition political parties. An indirect tax on consumer goods and services, VAT, was formed as a uniform tax to replace the existing tax regimes including the Sales Tax, the Advertisement Tax, and the Entertainment Tax (Ayee 1997). These taxes were saddled with a plethora of policy and management problems (Ayee 1997; Agyei and Marfo-Yiadom 2012). On the policy side, the country's tax base was extremely narrow, excluding the booming sectors of the economy and yielding low revenue. In terms of management, revenue leakages were common due in part to

fragile checks and controls in the tax collection system (Chapman 2001). These shortfalls necessitated the enactment of the VAT. With the initial standard rate pegged at 17.5%, the VAT policy provided few exemptions for basic commodities and services such as foodstuffs, drugs, public transportation, education, and health care (Agyei and Marfo-Yiadom 2012). Interestingly, after a short lifespan of 3 months, the policy was truncated (Dordunoo and Dogbey 2002; Agyei and Marfo-Yiadom 2012). Revised and reintroduced in 1998, the new VAT policy contained a lower tax rate of 10%, compared to the initial 17.5%. How do we account for this change? How did the public influence the shift in the VAT policy? This entry examines how the tax instrument contained in the first VAT policy changed. The substantive focus is on the processes of taxation policymaking. Drawing on Sabatier and Weible (2007) advocacy coalition framework (ACF), this entry argues that the adoption of low tax rate in the revised VAT is largely attributed to a hurting stalemate and negotiated agreements in the 1996 multiparty parliament. It is further argued that the low tax rate was largely a compromised position on the core beliefs of two coalitions: the Alliance for Change coalition (Alliance) and the Association of Committees for the Defense of the Revolution (Cadres coalition).

This study builds on earlier works that have examined the political and economic factors that permitted taxation policy change in Ghana (Assibey-Mensah 1999; Osei 2000; Opoku 2005; Osei and Quartey 2005). Although this entry finds the existing studies informative, nevertheless, they are descriptive since they are not explicitly situated in mainstream policy theory. As a point of departure, this entry studies VAT with a theoretical perspective, grounding the analysis in the ACF. Using this framework offers a richer analysis of the processes that enabled taxation policy change in Ghana. It provides a detailed empirical analysis of how the opposing beliefs of the Alliance and the Cadres coalition ultimately influenced the revised VAT policy. By accounting for the policy beliefs of pressure groups, the ACF illuminates our understanding of the role of the public in taxation policymaking. Thus, the ACF finds utility not only in developed democracies but also in the context of emerging democracies. Providing rigorous analysis of the processes of the VAT policymaking through the lens of ACF, this study contributes to filling both empirical and theoretical gaps in the literature on taxation policy in Ghana.

The remainder of this entry is organized as follows. The first section examines the theoretical framework, which is ACF in which the analysis is situated. ACF assumptions, policy change mechanisms, and explanations of the policy process are discussed. Methodology is presented in section two. The next section details the policy context of VAT. Application of the ACF requires identification of the coalitions in a policy conflict. Therefore, in the fourth section, the coalitions that were dominant in Ghana's taxation policy subsystem and the impact of their resources are identified. The VAT adoption processes are analyzed in two separate sections in a temporal manner. The first unsuccessful attempt to establish the VAT policy is examined in the fifth section. The sixth section analyzes the second phase of the policy development when VAT was decisively adopted. The final section concludes the discussion and provides implications of the findings for policymaking in Ghana and other fledgling democracies.

## Theoretical Framework: ACF and the Policy Process

This entry uses the ACF to examine the formation of the VAT policy in Ghana. A critical survey of the VAT policy literature reveals that researchers have taken the theoretical underpinnings of the entire policy formulation process for granted. In addition, the ACF is not a popular framework among scholars investigating the policy process in Africa. In a stock taking study, Weible et al. (2009, p. 129) found that the ACF has been applied to only a single study in the whole of Africa, compared to numerous studies in North America and Europe. The reason for the limited number of ACF applications in Africa used to be a

shortfall in the framework itself. Because of its pluralist assumptions, the ACF was originally not applicable to closed and authoritarian regimes, which were highly prevalent in Africa. But the framework has utility in most parts of contemporary Africa in general and Ghana in particular. Originators of the framework have revised it, incorporating the political opportunity structures and two additional paths to policy change into the theory (Sabatier and Weible 2007). Furthermore, the present democratization process in Africa, particularly Ghana's iconic democracy on the continent, offers fertile grounds for applying the ACF now. Therefore, this entry uses the ACF to examine the processes that led to the establishment of the VAT policy in Ghana following an earlier botched attempt. The ACF is useful for comprehensively identifying and explaining coalitions and how they utilized their resources to get their beliefs reflected in the final policy.

Introduced by Sabatier and Jenkins-Smith, the ACF emphasizes advocacy coalitions' role within the policy subsystem (Sabatier and Weible 2007, p. 189). Policy subsystems, scientific and technical information, belief systems, and coalitions are central to the ACF. The framework contends that the policymaking process is complex in that there are a multiplicity of policy participants, uneven distribution of resources among actors, as well as nested and overlapping institutions. This complexity requires policy actors to specialize in a policy subsystem, where most policymaking takes place, if they are to be influential in producing policy change (Weible et al. 2009). The set of policymakers in a subsystem comprises the conventional policy actors including lawmakers, bureaucrats, judicial officers, leaders of interest groups, researchers, as well as journalists who specialize in a particular policy area. Being the unit of analysis of the ACF, a policy subsystem is defined by both geographic and functional dimensions (Weible et al. 2009). In this study, the territorial entity is Ghana while the substantive dimension is taxation policy. Ghana's policy subsystem was a nascent one at the time of the taxation policy. It had barely returned to civilian rule on 7 January 1993, after a protracted military dictatorship.

In addition, policy beliefs are an important variable in the ACF since it is inextricably linked with the formation of coalitions. As the driving force behind actors in the policy process, the ultimate desire of coalitions is to get their beliefs translated into a policy (Weible et al. 2009). According to Sabatier and Weible (2007), policy actors have a three-ladder belief system. At the summit of the ladder are deep core beliefs, which are the most stable and normative in nature and consequently difficult to change. Moderate in scope, core beliefs are in the middle of the hierarchical belief system. Coalitions are normally formed on policy core beliefs since they are specific (Weible et al. 2009). At the bottom are secondary beliefs, which are narrowest in both geographic and substantive scope and easiest to change.

Policy core beliefs constitute the fulcrum around which coalitions are created. A coalition is formed when a group of actors aligns with those who share similar policy core beliefs and coordinate in a nontrivial manner in order to get these beliefs reflected in a policy (Sabatier and Weible 2007). Policy actors jostle to have their beliefs translated into a policy ahead of their opposing actors. To be successful in the policy process, participants who share similar beliefs align and cooperate, thereby establishing coalitions. Similarly, resources constitute key determinants of the ability of coalitions to get their beliefs translated into a policy. They may use policy-relevant resources such as access to formal legal authority to make policy decisions, public opinion, information, mobilizable troops, finances, and skillful leadership to influence the policy process (Sabatier and Weible 2007).

Another significant aspect of the ACF is that it identifies four paths to policy change. These are policy-oriented learning, exogenous perturbations, internal shocks, and negotiated agreements (Sabatier and Weible 2007). This entry uses the negotiated agreements path to explain the VAT policy process in Ghana. Negotiated agreements specify that "professional forums provide an institutional setting that allows coalitions to safely negotiate, agree, and implement agreements"

(Weible et al. 2009, p. 124). Coalitions that were previously fighting each other reach agreements over policy core changes. Sabatier and Weible (2007, pp. 206–207) provide nine conditions that affect the likely occurrence of policy change through negotiated agreements. These are incentive to negotiate seriously (a hurting stalemate), leadership, funding, duration and commitment, the centrality of empirical issues, the importance of building mutual trust, and a relatively few number of alternative venues.

In particular, hurting stalemate, composition, and consensus-based decision rule were crucial to the Ghanaian case. Composition emphasizes the importance of including the representatives of all the relevant groups, including those that are perceived to be difficult to deal with, in the negotiation process (Sabatier and Weible 2007, p. 206). If some actors are excluded from the process, they may use alternative means to stymie the success of policy development. Consensus-based decision rule is at the heart of negotiated agreements. Consensus is necessary for preventing a disgruntled actor from undermining the implementation of an agreement (Sabatier and Weible 2007, p. 206). As discussed later in this entry, Ghana's VAT was successfully re-created following the need to negotiate with the minority in Parliament, inclusion of the opposition parties that were in the vanguard of the Alliance coalition and consensus reached among all the key policy participants.

## Methodology

This entry is a small-N qualitative study involving a single case (Lieberson 1991; Coppedge 1999). It is a case study of taxation policymaking in Ghana in the mid-1990s. The case study method is a detailed examination of an aspect of a phenomenon or historical episode in order to understand or shed light on the broader phenomenon (George and Bennett 2005). To understand policymaking in the period under consideration, this entry focuses on and intensively investigates taxation policymaking.

The diachronic type of the case study method is employed in this study (Gerring 2004, 2007). A diachronic case study is an intensive investigation of a single case across time, usually within two or more periods. It allows for within-case comparisons in a temporal manner (Gerring 2004, 2007). In this study of Ghana's taxation policy process, two phases are identifiable as the national assembly enacted the VAT policy at two different periods. The initial attempt to develop and implement VAT in 1995 constitutes the first phase. Government withdrew the policy and reintroduced it in 1998. This reformulation is the second phase of VAT policymaking in Ghana. These two periods are the focus of this research. Focusing on the initial abortive phase and the reenactment process, a diachronic case study enables us to collect a considerable amount of information over time to undertake a within-case comparisons of the VAT policy.

Empirical data is collected from reports of the media and NGOs. These data are analyzed using process tracing through an ACF lens. Process tracing is a method of within-case analysis to evaluate causal processes (George and Bennett 2005; Bennett 2010). It is useful for establishing causality by focusing on sequences of variables (Bennett 2010; Collier 2011; Mahoney 2012; Trampusch and Palier 2016). Employing this technique allows us to examine the pieces of evidence that have been collected about coalitions, events, conditions, and the processes leading to the final formation and adoption of the VAT policy. This is supplemented by field data of five elite interviews comprising individuals very familiar with the adoption of the VAT policy in Ghana. The interviewees were drawn from the academic community, civil society organizations, and the media.

## A Battle of Two Giants: The Alliance and the Cadres Coalitions

In Ghana's VAT policy formulation process, two contending coalitions are identified as the Alliance for Change (Alliance) and the Association

of Cadres for the Defense of the Revolution (Cadres). Formed on 26 April 1995, the Alliance coalition drew its membership from across a broad section of the public including leaders and stalwarts of the opposition New Patriotic Party (NPP) and the People's Convention Party (Frempong 2012, p. 68), businesses and their associations, journalists, and unemployed youth. The policy core belief of the Alliance was low tax rate, arguing that leakages and malfeasance were prevalent in the existing tax regimes that the government needed to address. The government, the Alliance believed, ought to carefully rethink its taxation policy. The Alliance coalition coordinated in a nontrivial manner to organize massive and fatal demonstrations in Accra and Kumasi (the two largest, commercial cities in Ghana). Although they were not official members, the Ghana Trades Union Congress (TUC) and the Civil Servants Association shared identical views with the Alliance on the VAT policy and participated in the protestations. The TUC in particular was at logger heads with the government over salary adjustments since real incomes had fallen. In a vehement opposition to the high tax rate, the TUC had described 1994 "as a year of frustration for organized labor" and labeled the 1995 budget as "a budget of despair" (Osei 2000, p. 269). An interviewee from the TUC indicated that "we joined forces with the opposition political parties to counter the introduction of the VAT largely because it had eroded the purchasing power of the generality of our members and rendered their standard of living poor. A withdrawal of the tax was seen as the only way to ameliorate the conditions of our members" (Interviews 2017).

Businesses' alignment and coordination with the Alliance coalition was particularly significant. Business and trade associations passionately resisted the 17.5% rate as being too high, claiming that its ruinous ramifications undermined the purchasing power of the Ghanaian consumer and will potentially kill their businesses. Instead, they proposed a low tax rate (5%) to be increased incrementally each year (Opoku 2005). The government, in an archetypical dictatorial fashion, dismissed their concerns as being politically motivated. In response to the government's snobbish attitude, members of the Ghana Union of Traders Association (GUTA) refused to open their shops for 5 consecutive days as a means of expressing their opposition to the high VAT rate. The Bureau of National Investigations (BNI) arrested and detained two leaders of GUTA for provoking anti-VAT sentiments among their members (Opoku 2005). Consequently, they strongly aligned with the Alliance coalition and joined the protest marches.

On the contrary, the Cadres coalition was mainly an amalgam of former cadres of the Provisional National Defense Council (PNDC), who were enthusiasts of the National Democratic Congress (NDC) government (Osei 2000). It sprang from the mobilization wing of the PNDC known as the Committees for the Defense of the Revolution, which had collapsed following the country's return to constitutional rule in 1992. Backed by state power, the Cadres coalition spontaneously resurfaced to oppose the Alliance coalition. It is suggestive that they might have been deployed by the government to counter the Alliance coalition's energetic resistance to VAT. The Cadres coalition's core belief was the maintenance of the original 17.5% standard rate of the VAT policy. The Cadres coalition coordinated with cadres of the PNDC revolution to organize counter-protests.

The two jostling coalitions had enormous policy-relevant resources. The Alliance coalition could boast of favorable public opinion. Several factors accounted for the public support it enjoyed. The 1995 budget, which was introduced barely 2 months before the formation of the VAT, had already increased prices of commodities including groceries. Prices of petroleum products increased by more than 20% (Ayee 1997). Apart from the sharp rise in the prices of commodities and services, the public was already experiencing severe food shortage owing to lean harvest in 1994. The public perceived the VAT as aggravating their existing economic perturbations. All this played to the advantage of the Alliance coalition (Interviews 2017).

Moreover, the Alliance coalition had access to information. Among its members was Kweku Baako, the editor of the *Guide*, as well as Kwesi

Pratt Jnr of the *Insight* newspaper, who published evidence about high economic and social costs of the policy. The Alliance coalition used this information to whip up public support for its cause. Additionally, the Alliance coalition was able to bring well-known personalities in the two political traditions in Ghana (Nkrumaist and Danquah-Busia-Dombo traditions) together in a way that sent clear message to the government of the day that the members were united toward a common agenda (Interviews 2017). The low tax rate was shared by the Centre for Economic Policy Analysis (CEPA), an independent economic policy think tank headed by Dr. Joe Abbey, an economic policy advisor to the PNDC *junta* and one of the main architects of Ghana's Structural Adjustment Program (Osei 2000). Low tax rate, Dr. Abbey maintained, would serve the government's revenue target better than a high tax rate, especially if the government was to ably broaden the tax base and widen the scope of the tax net. He recommended a rate between 10% and 12.5%. In sum, CEPA provided the benefit of an alternative tax rate, which further reinforced the position of the Alliance coalition.

In relation to mobilizable troops and skillful leadership, the Alliance coalition had key figures of the opposition parties and civil society organizations as leaders. Among its leaders was Nana Akufo-Addo, a renowned lawyer, human rights activist, businessman, and politician, who became the standard bearer of the main opposition NPP in the 2008, 2012, and 2016 presidential elections. Nana Akufo-Addo won the 2016 presidential election in Ghana after defeat in the previous elections. Others were Hawa Yakubu (one of the only two independent Members of Parliament) and Wereko-Brobbey, an engineer and industrialist (Osei 2000). They skillfully managed to capture public frustrations and organized mammoth demonstrations involving thousands of ordinary Ghanaians (Opoku 2005). Impliedly, the Alliance coalition gained access to formal legal authority to make policy decision when some of its leading members, including Nana Akufo-Addo, became Members of Parliament in 1997.

On the contrary, the Cadres coalition spontaneously emerged from the defunct Committees for the Defense of the Revolution (CDRs) to counter the Alliance coalition. The PNDC created the CDRs to involve the grassroots in public policymaking and implementation of government initiatives. The CDRs, Ray (1986) observes, were responsible for organizing revolutionary and ideological training at the local level, community mobilization, distribution of limited goods, and price controls. They also served as channels of communication between the government and the grassroots. Membership was open to all persons supportive of the revolution and its ideals, regardless of economic and social status, gender, ethnicity, or religion. This effectively excluded persons who opposed the 1981 revolution. Members of the CDRs were called cadres. Thus, the Cadres coalition was not new and had enormous resources because of its affinity with the NDC government. The government, Osei (2000) argues, intentionally deployed the Cadres coalition when it faced policy difficulties. First, it could count on the overwhelming support of the government and the NDC MPs who supported VAT's original standard rate. This implies that, unlike the Alliance coalition, the Cadres coalition ab initio had access to formal legal authority to make decisions and could also boast of financial resources. As a purported offspring of the NDC, they received government funding.

Nevertheless, public opinion seemed to be at odds with the Cadres coalition. Its public image was poor largely because it was seen as an oppressive instrument. Its association with the egregious human rights infractions that occurred in Ghana during the erstwhile PNDC regime (Osei 2000; Interviews 2017) was not lost on Ghanaians. It was remembered for rigid price controls, harassments, and public flogging of civilians in the heyday of the revolution. The Cadres coalition aggravated its negative public image when members attacked the Alliance coalition demonstrators and shot into the crowd in a counter-demonstration, killing four protesters and injuring several others (Green 1995). The shooting incident created legitimacy deficit for the "new" civilian regime. From all indications, it appeared that the Alliance coalition had more resources than the Cadres coalition, with the exception that the latter

enjoyed support of the government and the backing of the NDC-dominated Parliament (access to formal authority to make decision). Generally, the presence of several influential civil society groups on the side of the Alliance coalition ensured that they gained more acceptance among the masses than the Cadres coalition (Interviews 2017).

## The Policy Context of VAT

In Ghana, tax reforms constituted a major aspect of the World Bank and the International Monetary Fund (IMF) sponsored Economic Recovery Program (ERP) in 1983 (Osei and Quartey 2005; Von Soest 2008). Value-added tax, Opoku (2005) asserts, was the flagship economic policy of the government since the neoliberal reforms began. Adoption of the market-based reforms was triggered by Ghana's economic dire straits in the 1980s (Hutchful 2002). On the one hand, international reserves dwindled by about 12%; on the other hand, external debts soared by about 17% (Edjekumhene et al. 2001; Edjekumhene and Dubash 2002). Foreign exchange shortages and balance of payment difficulties were prevalent. Inflation skyrocketed to 142%, while the value of the country's local currency, the Cedi, was set on a downward spiral (Parfitt 1995). The ERP aimed at tackling these challenges and stabilizing the Ghanaian economy through market-oriented policies and loan facilities from the international financial institutions.

The government commenced moves toward forming the VAT policy in 1989, when it commissioned a feasibility study to be jointly conducted by the Harvard Institute for International Development and the Crown Agents of the UK (Terpker 1993). The report of the study recommended that the government should switch from the sales tax, which charged a standard rate of 15% to VAT. Accepting the recommendations of the report, the Minister of Finance ceremoniously announced government's intention to introduce the VAT policy in July 1993 (Ayee 1997). The purpose of the new tax policy was to ensure diversity in the country's sources of revenue by exploring domestic alternatives. It also aimed at generating additional revenues to address budget deficit and other fiscal challenges that confronted Ghana's stagnating economy (Assibey-Mensah 1999).

The Government of Ghana showed commitment to passing the tax reforms mainly due to the promised benefits of the policy. By avoiding cascading taxes and charging "only the value added by the person being taxed," Ayee (1997, p. 52) postulates, VAT promised to avoid "tax distortions and over-taxation." It was anticipated to eliminate obsolete tax incentives and tax burdens which yielded tax distortions (Osei 2000). The policy, again, promised the value of transparency (Ohemeng and Owusu 2015) by allowing for modern methods of documentation and record-keeping. Transparency was to be achieved through record-keeping in the form of an invoice trail created to provide mandatory records of transactions (Ayee 1997; Osei 2000). According to government, the policy had the potential to minimize revenue loss by curbing high rates of tax avoidance, tax evasion, and fraud. Tax leakages emanating from poor checks and fragile control measures were to be remedied (Ohemeng and Owusu 2015).

Moreover, VAT could potentially increase tax revenues by broadening the tax base and widening the scope of the tax net to cover previously untaxed sectors of the economy including wholesale and retail trade and services (Ayee 1997; Assibey-Mensah 1999; Osei 2000; Opoku 2005). Whereas these sectors were rapidly growing, they were not charged by the status quo tax regime. The tax net was expected to expand to cover more business outlets in the fast growing sectors of the Ghanaian economy with the introduction of VAT. The government flaunted economic efficiency as a rationale for the creation of the new tax policy (Opoku 2005; Agyei and Marfo-Yiadom 2012). It anticipated making the indirect tax system efficient, while lowering the burden of taxpayers, businesses and tax administrators (Osei 2000). Assibey-Mensah (1999) strongly contends that the policy assured of making the country's tax base simple for easy administration and compliance. Apart from economic efficiency, the policy had the advantage of more equity, fairness, and stability in tax revenues. The

VAT policy was to assist in reducing the country's overreliance on declining excise taxes on petroleum and export duties on primary commodities.

## First Creation of VAT: A Policy Debacle

Due to the potential benefits of VAT, the government sent the policy for legislative approval in accordance with Ghana's 1992 Republican Constitution, which vests law-making powers in Parliament. On 11 November 1994, debate on the policy started on the floor of the legislative assembly. The debate showed that Parliament, although dominated by the NDC and its allies in the Progressive Alliance (Assensoh and Wahab 2008), was deeply divided over the policy (Opoku 2005). Consensus was lacking: some MPs unflinchingly supported the policy, whereas others dissented. The Leader of the Minority expressed disgust at the taxation policy. Interestingly, he described VAT in a sarcastic language as "Very Augmented Trouble" (Ayee 1997). An NDC MP was more concerned about the political fortunes of the party and its MPs in the 1996 elections than the economic and administrative rationality of the policy. Parliament should, the legislator argued, reject the policy since the electorate will feel stabbed in the back and would not return them to the legislative chamber. But MPs who supported the policy fervently countered, contending that VAT was a tax instrument that would be useful for capital formation, providing funding for social services such as education, health, housing, and other critical sectors of the Ghanaian society (Osei 2000).

The controversy was not limited to the national assembly. The policy generated hullaballoo among the Ghanaian populace. Since the Alliance coalition had not been formed then, opposition parties, businesses, and other opposing forces resisted the policy from outside the legislature. Indeed, the opposition parties had boycotted the 1992 parliamentary elections (Green 1995; Frempong 2012), arguing that the presidential election held early on was fraught with malfeasance and massively rigged by Rawlings' NDC. They condemned the outcome of the election as a stolen verdict. Hence, the opposition did not have representation in the 1993 Parliament, with the exception of two independent candidates, as the NDC-led Progressive Alliance won 198 seats in the 200-member Chamber (Assensoh and Wahab 2008). Thus, they could not participate in the policy process in Parliament except from without. They initially lampooned the policy for its betrayal of the poor (Donkor 2013), claiming that the Rawlings administration had succumbed to the IMF's neo-imperialist taxation policy that overlooked the plight of the poor and vulnerable in society. Another criticism was that, in addition to the high standard rate contained in the policy, the government did not involve them in the policy formation process (Opoku 2005). Businesses and their associations such as GUTA, the Association of Ghana Industries (AGI), and the Ghana Chamber of Commerce did not spare the policy of condemnation.

Despite these controversies, VAT was approved under a Certificate of Urgency on 1 December 1994 at a standard rate of 17.5% (Assibey-Mensah 1999). The government dismissed public outcry and the concerns expressed by the opposition, the media, businesses, and civil society organizations as constituting political opportunism. Participation in the VAT policy process was not encouraged. Although it had changed from the PNDC military *junta* to constitutional rule, it still maintained its dictatorial ethos to policymaking. Prior to 1993, the PNDC considered expression of dissent to public policy as sabotaging public authority (Osei 2000), imposing a "culture of silence" in which free speech was muzzled. This lack of popular participation was to be the Achilles' heel of the VAT policy.

Following the legislative approval, the government commenced the implementation of VAT on 1 March 1995, though not without postponements. However, after a short lifespan of 3 months, the government was compelled to truncate the policy due to overt adversarial public reactions (Dordunoo and Dogbey 2000; Agyei and Marfo-Yiadom 2012). Prices of food and other commodities exempted by the new taxation policy soared as traders and businesses worsened the plight of

the Ghanaian public by passing on both the VAT charges and the hikes in transportation fares to consumers (Ayee 1997). As indicated previously, Ghanaians were beset with lean harvest in the 1994 farming season; food was in short supply in 1995. They were already reeling under increased prices of goods and services caused by the 1995 budget presented barely 2 months before the introduction of VAT. According to Osei (2000), the major concern of the public was steep price hikes. Inflation jumped from 24.2% to 56.5% in the same year, representing more than 100% increase. The banner headlines of newspapers were quite interesting. The state's newspaper, *Daily Graphic*, cautiously wrote: "VAT: Its effects on prices" and "VAT forces prices up" whereas the private newspapers critical of the NDC government cynically wrote: "VAT: People are charging VAT on VAT" and "VAT: The problem solver arrives in Ghana" (Osei 2000, p. 247).

It was in the midst of these public frustrations against price hikes that the Alliance coalition and the Cadres coalition emerged. As discussed earlier, the Alliance coalition maintained that the rate was too high and the government must rather address the numerous leakages and malfeasances in the country's tax administration. But the Cadres coalition passionately opposed the Alliance's policy belief, supporting the 17.5% standard rate of the new tax policy. The public outcry and agitations reached its crescendo on 11 May 1995, when the Alliance coalition organized a huge demonstration in Accra and later in Kumasi on 25 May 1995. The protests was code-named *Kume Preko*, literally, kill me once and for all. Protesters claimed they preferred to be killed fast rather than slowly through imposition of strangulating taxes. Thousands of ordinary Ghanaians participated in the demonstrations. Encouraged by public support, the Alliance coalition planned similar protestations across the remaining regional capital cities. The Cadres coalition organized a counter-demonstration. It was in this counter-demonstration that the Cadres fatally clashed with the Alliance. Four people lost their lives and several others were injured. This was comparable in numbers and casualties to the 1948 riots in the Gold Coast (Ghana's original name), which triggered nationalist passion, following the shooting incident that claimed three lives and caused injuries to several people at the Christianborg Castle in Accra (Frempong 2012).

Consequent upon the deadly protestations, the government panicked and reduced the rate to 15%. Nevertheless, the Alliance persisted for further reduction (Ayee 1997), efficiently using the information on the adverse effects of the high rate and favorable public opinion. Faced with legitimacy crisis and fearing political instability and defeat in the impending 1996 elections, the government withdrew the policy on 14 June 1995 (Ayee 1997; Osei 2000; Agyei and Marfo-Yiadom 2012) and the long-serving Finance Minister, Kwesi Botchwey resigned. This marked the futility and ignominy of a public policy process that defied popular concerns and disregarded the peculiarity of the people's economic and political circumstances. This policy debacle could be attributed to the unwavering persistence of the Alliance coalition and the efficient utilization of its resources. The government was to learn its lessons and revise the VAT policy in 1998.

## Reformulation of VAT: A Negotiated Compromise

As argued earlier, the negotiated agreements path to policy change in the ACF is useful for explaining the low rate contained in the revised VAT policy. In particular, three of the nine conditions that affect the likely occurrence of policy change through the negotiated agreements path are significant to the Ghanaian case. These are a hurting stalemate, consensus-based decision rule, and inclusion.

When the minister of finance, Kwesi Botchwey, abdicated his position in June 1995, he was replaced by Kwame Peprah. Contrary to public expectation, the new Minister of Finance immediately declared his intention to reintroduce the VAT policy (Osei and Quartey 2005). But the government pledged to revise the policy for adoption at a later time. In a sessional address to Parliament in January 1996, President John Rawlings informed Ghanaians of his

government's desire and commitment to reintroduce VAT. The government's unbendable commitment to this policy could be partly explained as an ingenious move to reduce the country's aid dependence syndrome by pursuing a local alternative source of tax revenues (Osei 2000). But Addison and Osei (2001) claim that the government was committed to VAT because an Economic Community of West African States' (ECOWAS) protocol enjoined member states to adopt the uniform tax policy by close of the year 1999. ECOWAS deadline loomed large.

Regardless of how the government's unbending commitment to the policy was perceived, it cannot be gainsaid that the NDC's overwhelming victory in the 1996 elections endowed the Rawlings government with political capital, which rekindled its commitment to reintroduce the policy. It is worthwhile that the NPP and other opposition parties fully participated in this election. Although the NPP's performance in the presidential election was abysmal, it won a significant number of parliamentary seats for the first time since the country's return to democratic rule (Frempong 2012, p. 71). Unlike the 1992 Parliament that approved the original VAT policy, the 1996 Parliament was an inclusive political institution. Among those who won parliamentary seats on the ticket of the NPP were some stalwarts of the Alliance coalition, including Nana Akufo-Addo.

The government's withdrawal of the policy and the anxiety that enveloped the 1996 elections could not douse the VAT debate. The electioneering stoked the flames of the debate alive as the opposition attempted to expropriate political gains from the policy debacle and the fallout of the *Kume Preko* demonstrations. But what gave the VAT debate more momentum were calls from a section of the business community for revision and reintroduction. The Private Enterprise Foundation and the Chairman of Uniliver Ghana Limited, Ishmael Yamson, argued strongly for a review and restoration of VAT. Their argument reinforced the policy core belief of the Alliance coalition as they clamored for a lower rate than the original standard rate. Joe Abbey of CEPA was unrelenting in his support for the Alliance's core belief in that he continuously shared the low tax rate view. His outfit believed that the government could still achieve its revenue target should it broaden the scope of the tax net (Osei 2000).

A National Economic Forum was held in October 1997 to discuss government economic policymaking and implementation in general. The Forum was attended by the policy community including the Alliance coalition, the Cadres coalition, and other stakeholders in the VAT policy. The Forum showed that, while there was a general support for or agreement on the VAT policy in principle, the high tax rate and financial malfeasance in the tax system were unacceptable to the opposition who would block the policy unless it was revised (Stapenhurst 2004). The Forum succeeded, among others, in bringing the policy community together to build consensus for VAT.

In February 1998, the government started a new policy process to remedy the earlier policy fiasco by reworking the VAT policy. This opened the opportunity for the Alliance coalition to fully participate in the policy process and to bring their influence to bear on the VAT policy. In accordance with the inclusion and consensus-based decision rules in the ACF's negotiated agreements path to policy change, the Alliance coalition took the opportunity that was opened by the NPP's presence in Parliament to shape the policy at its reformulation stage, instead of protesting at the implementation phase. Though the Cadres coalition appeared docile at this time, nonetheless, its backers were still in power. The Alliance had to contend with the NDC government and its majority in Parliament. While the Alliance seemed powerful, its members in Parliament did not have the required numerical strength to impede the policy from being passed. In line with the ACF negotiated agreements path, the inclusive elections in 1996 made Parliament a professional forum that provided an institutional setting for the Alliance and the government that backed the Cadres to safely negotiate, agree, and implement the VAT policy.

On 7 January 1998, the Minister of Parliamentary Affairs introduced the VAT policy in the legislative assembly on behalf of the Minister of Finance. The memorandum that accompanied the

revised policy contained a 15% rate. The Ministry of Finance considered this rate to yield a "revenue-neutral" position (Boadu et al. 2001). The Finance Committee of Parliament deliberated on the revised policy. The Committee's composition was significant for an inclusive policymaking process and negotiated agreements. It comprised 60% from the majority NDC that backed the Cadres coalition and 40% from the opposition that led the Alliance coalition. In a sharp contrast to the 1993 Parliament that passed the original VAT policy, the Alliance was represented in the 1997 Parliament by the opposition, thereby gaining access to formal decision making authority.

The Finance Committee invited submissions from the general public and organized public hearings. Civil society organizations that shared the core belief of the Alliance, including the TUC and the Ghana Civil Servants Association, submitted memoranda and participated in the proceedings of the Committee (Boadu et al. 2001). Businesses and their associations actively took part in the public hearings and consultation process. To improve understanding of the VAT policy and facilitate consensus building, several technical workshops were organized for the members of the Finance Committee (Chapman 2001) throughout the period of the Committee's deliberations. Being a neutral party in Ghana's politics, the country's development partners were highly instrumental in organizing the technical assistance workshops. The UK Department for International Development was useful in this regard (Chapman 2001).

The Committee, upon comprehensive discussions and public consultations, unanimously agreed on a 10% tax rate instead of the proposed 15%. Following the submission of the Committee's report to Parliament, the legislative chamber provided an additional institutional setting for debating the Committee's recommendation of 10% rate. The minority in Parliament efficiently used their resources in the debate by emphasizing the prospects of a low tax rate for an economy that has a wide tax net and an efficient tax administration. VAT was accepted in 1998 partly due to a change in opposition tactics: they were in Parliament after the 1996 elections, and thus took part in shaping the policy (Osei 2000, p. 273). In the words of Assensoh and Wahab (2008, p. 302), the policy "was debated and passed rather convincingly in 1998 by 105 to 55 votes." This was followed by extensive consultations between Parliament and the executive over the 10% rate (Chapman 2001). Consensus was ultimately built on the tax rate as the government was convinced to soften its earlier posturing (on 15%). In December 1998, the VAT policy was subsequently adopted and reintroduced at a rate of 10%, from an original higher rate of 17.5%. In tandem with the negotiated agreement path to policy change, the consultations between the two arms of government equally suggest that the two coalitions were caught in a hurting stalemate, which may have pushed them toward compromise. The 10% tax rate was a clear compromise between the coalitions. Neither coalition got exactly what they originally desired, but they found some common ground.

## Conclusion

This entry used the negotiated agreements path in the ACF to explain the VAT policy change in Ghana. Initially introduced at 17.5%, the Alliance coalition efficiently utilized its resources particularly public opinion, strong leadership, and information to get the policy terminated. But this did not happen without protestations and fatalities. During the re-formulation process, they fully participated in an institutional context that facilitated inclusion and consensus building. As the ACF holds, the smooth redevelopment of the VAT highlights the usefulness of inclusion and consensus-based decision rule in a democratizing policy environment. Contrary to the initial formation of VAT, the second policymaking process seemed seamlessly peaceful as it emphasized inclusion and consensus building. The Alliance coalition was previously alienated from the policy process. But they were included in the revision process and compromise eventually reached on the 10% rate.

A useful lesson learnt is that inclusion, participation, consensus-building, and compromise are crucial for policymaking since it is a political process that distributes benefits and burdens among actors with varying values. It is also learnt that, with effective leadership skills and information dissemination, opposition is capable of swaying public opinion against government initiatives.

Policymakers ought to address public concerns about proposed policies. Hopefully, Ghana's experience with VAT development would provide valuable lessons for other democratizing countries that are reforming their taxation policies. Lastly, this study might provide research opportunities for policy students interested in the application of theory to empirical policy problems including tax reforms in the context of developing countries.

**Declaration of Conflict of Interest** The authors declare that there is no conflict of interest.

## Introduction

This entry covers teaching and training in nonprofit organizations, specifically within the context of nonprofit management education (NME) within the university setting in the United States. The United States was selected due to more availability of published literature in NME. Therefore, this entry will explore the historical development of NME, location and types of degrees offered, faculty demographics, course topics, alumni outcomes, as well as current challenges and future opportunities for NME in the United States.

## Historical Development of NME

Although nonprofit organizations can be traced back to the beginning of the United States, the development of the academic discipline of NME began about 110 years ago. The earliest form of NME can be traced back to the Bachelor and Master of Humanics degree established by Springfield College in 1905 and the Bachelor of Association Science established by Chicago YMCA College in 1911 (Lee 2010).

In 1954, the American Humanics program was established to certify undergraduates and prepare them for careers within youth and human service organizations. Additionally, other colleges and universities established master's degrees in hospital administration. Even with the establishment of these early programs, there is widely held consensus that *formal* NME programs were not established until in the early 1980s and that the programs that were started earlier can be considered "industry-specific" education (O'Neill 2005).

Many graduate degree programs, such as master's degrees in public administration, social work, political science, sociology, and business started adding 1–2 nonprofit specific courses, then nonprofit specializations over time (which include three or more nonprofit specific courses). It is thought that University of Missouri, Kansas City, was the first university to offer a standalone nonprofit management master's degree program in 1981, then the Master of Nonprofit Management at the University of San Francisco was established in 1983 (Burlingame 2009).

During the mid-1990s and into the first decade of the twenty-first century, a few foundations channeled significant funding to NME programs. The establishment of the Nonprofit Academic Centers Council and the Independent Sector helped NME become established, as did the publishing of a variety of nonprofit books and journals (O'Neill 2005). Research

conducted since 2000 suggested the potential shortage of nonprofit professionals as the sector competed with the government and business sectors for talent (Cornelius et al. 2008). To meet these projected leadership needs, colleges and universities across the nation increased their undergraduate and graduate programs focused on nonprofit management and leadership.

## Location

NME courses, certificates, and programs then sprouted up in a variety of different disciplines and schools in universities across the United States. In fact, due to the many disciplines in which NME programs emerged, there has been much debate over where these NME degree programs should be housed. Typically, programs are housed within schools of arts and sciences, and the social sciences, such as public administration, business, and social work because of the home discipline of the faculty member who created the course, certificate, and/or degree program.

Scholars who argue for NME programs to be housed within schools of public administration tend to have background and doctoral education in public administration. There are some scholars that argue for NME programs to be housed within schools of social work or social welfare due to the social justice or social issues that are covered within such programs, and some argue that NME programs should be housed within business schools, stating that nonprofit is merely a tax status and nonprofits should operate like businesses. Table 1 shows research conducted by Mirabella and McDonald (2013) indicating the institutional location of NME master's degree concentrations and increases or decreases of locations over time.

As shown in Table 1, NME concentrations have remained steady in arts and sciences and increased tremendously within schools of public administration and schools of social work since 2006.

**Teaching and Training in Nonprofit Organizations, Table 1** Institutional Location of NME Graduate Concentration, 2006–2011. (Taken from Mirabella and McDonald 2013)

| School or College | 2006 | 2011 | % Increase (Decrease) |
|---|---|---|---|
| Arts and sciences | 48 | 46 | (4%) |
| Business | 22 | 14 | (36%) |
| Business and public administration | 13 | 8 | (38%) |
| Public affairs & administration | 13 | 39 | 200% |
| Social work | 7 | 20 | 186% |
| Other college or school | 22 | 29 | 32% |
| Total | 105 | 156 | |

## Types of Degrees Offered

Today there are over 340 universities in the United States that offer at least one course in nonprofit management (Mirabella 2016). Many of the universities offer undergraduate, graduate, and postgraduate degrees and certificates that focus on nonprofit management and nonprofit organizations. These degrees vary in nomenclature and course offerings.

There are approximately 150 universities that offer some sort of NME curriculum at the undergraduate level, which includes a course, certificate, or degree that focus on nonprofits. The following types of nonprofit-focused Bachelor degrees and certificates are offered: Bachelor of Art, Bachelor of Science, Bachelor of Business Administration, Bachelor of Public Administration, Bachelor of Nonprofit Management, and Certificate in Nonprofit Management, Certificate in Fundraising, etc. Table 2 shows the number of universities that offer nonprofit undergraduate course(s) and the number of universities that offer an undergraduate concentration in nonprofit management and the increase in NPM programs over time.

As shown in Table 2, there continues to be an increase in the number of undergraduate nonprofit courses and concentrations.

Today, there are over 250 universities that offer at least one master's level nonprofit course and

**Teaching and Training in Nonprofit Organizations, Table 2** Undergraduate nonprofit management education programs by year. (Adapted from Mirabella and McDonald 2013)

| | 1996 | 2006 | 2011 | 2016 |
|---|---|---|---|---|
| Universities offering NPM undergraduate courses | 66 | 117 | 136 | 150 |
| Universities offering NPM undergraduate concentration | 26 | 61 | 97 | N/A |

**Teaching and Training in Nonprofit Organizations, Table 3** Graduate nonprofit management education programs by year. (Adapted from Mirabella and McDonald 2013)

| | 1996 | 2006 | 2011 | 2016 |
|---|---|---|---|---|
| Universities offering NME graduate courses | 128 | 161 | 239 | 251 |
| Universities offering graduate concentration in NME | N/A | 105 | 156 | 210 |

over 210 master's degree programs that offer a concentration in nonprofit management (Mirabella 2016), which include approximately 25 standalone programs (a Master of Nonprofit Management or similar) The following types of nonprofit-focused master's degrees are granted:

- Master of Nonprofit Management or similar
- Master of Public Administration or similar
- Master of Social Work or similar
- Master of Business Administration or similar
- Master of Public Policy or similar
- Master of Human Services or similar
- Master of Philanthropic Studies or similar

Table 3 shows the number of graduate focused nonprofit management courses and concentrations by year.

Similar to undergraduate programs, there has been an increase in the number of NME graduate courses and concentrations since 1996.

There is very little information about NME focused PhD programs. The lack of research stems from the fact that few programs exist. Previous research explains there is a demand for PhD programs that focus on nonprofit management, but a few programs that supply the faculty, resources, and support needed to complete a nonprofit-focused PhD (Jackson et al. 2014). Although the number of nonprofit focused dissertations have increased, research shows that PhD students who focus on nonprofit management are primarily self-directed learners, which means they take 1–2 doctoral or master's level courses and write a nonprofit-focused dissertation (Allison et al. 2007). There is one program for PhD in Philanthropic Studies at Indiana University, Purdue University that is considered a "standalone" NME program. Standalone means that the entire IUPUI PhD program is focused on nonprofit and philanthropic studies. There are 44 other programs where students can take a few courses in NME during their PhD program and write a nonprofit-focused dissertation.

## Faculty Qualifications and Backgrounds

Faculty who teach in NME programs vary in their academic background, expertise, and full-time or part-time status. The ratio of full-time to part-time faculty varies by discipline. In 1998, it was reported that master's degree programs in public administration or business administration that offered a concentration in nonprofit management primarily had full-time faculty members teaching within the program, while other master's degree programs primarily had part-time faculty members teaching in the program. As the number of NME programs have increased, so have the number of full-time faculty members that teach in such programs. The ratio of full-time and part-time faculty members that teach in NME is also largely dependent upon if the program is accountable to a larger accrediting body. For example, a Master of Public Administration degree program that offers a nonprofit concentration must maintain the percentage of part-time faculty members less than 50%, due to requirements from NASPAA, the public administration education accrediting

body; whereas standalone programs have a much higher percentage of part-time faculty members who teach in the program.

Full-time faculties vary in their background and many do not have work experience outside the academy. Part-time faculties usually are recruited from their experiences managing a nonprofit and bring many community connections with them into the course and program. Generally, the full-time faculty member uses their network to recruit part-time faculty to teach courses within a nonprofit-focused degree program. A recent trend has seen more full-time faculty members coming out of schools of public administration, which is because of the large increase in schools of public administration that house PhD programs with nonprofit concentrations.

## Courses and Subject Areas

Due to the diverse academic disciplines where NME programs are housed, NME programs also vary on course content and topics covered within programs. Most programs tend to offer 1–2 nonprofit specific courses (such as nonprofit management or histories and theories of the nonprofit sector) and then several other nonprofit-related courses (such as public policy and fundraising). Many of the NME programs that are housed in schools of public policy tend to have policy-focused courses versus programs that are housed in business schools have management focused courses, and programs housed in public administration have courses that emphasize the relationships between government and nonprofits.

Much of the course content is degree and school specific due to the fact that up until now there has not been an accrediting body for NME. The Nonprofit Academic Centers Council (NACC) was created in 1991 with the mission to "support academic enters devoted to the study of nonprofit/nongovernmental sector, philanthropy and voluntary action" (NACC 2015). NACC created a set of curricular guidelines for nonprofit undergraduate and graduate programs in 2003, 2007, and most recently updated the curricular guidelines in 2015 along with voting to become the accrediting body for NME.

**Teaching and Training in Nonprofit Organizations, Table 4** NACC curricular guidelines 2015

| |
|---|
| 1.0 Comparative global perspectives on the nonprofit sector, voluntary action and philanthropy |
| 2.0 Scope and significance of the nonprofit sector, voluntary action and philanthropy |
| 3.0 History and theories of the nonprofit sector, voluntary action and philanthropy |
| 4.0 Ethics and values |
| 5.0 Nonprofit governance and leadership |
| 6.0 Public policy, advocacy and social change |
| 7.0 Nonprofit law |
| 8.0 Nonprofit economics |
| 9.0 Nonprofit finance |
| 10.0 Fundraising and resource development |
| 11.0 Financial management and accountability |
| 12.0 Leadership, management, innovation and entrepreneurship |
| 13.0 Nonprofit human resource management |
| 14.0 Nonprofit marketing and communications |
| 15.0 Information technology, social media and data management |
| 16.0 Assessment, evaluation and decision-making methods |

Table 4 shows a list of the NACC curricular guidelines at the master's level. Many NME programs include some of the curricular guidelines in their programs, but as stated above, there are only approximately 25 standalone nonprofit master's degrees within the United States that could fully utilize the curricular guidelines.

In an analysis of 1700 course syllabi of NME master's level courses, Mirabella and McDonald (2013) identified the frequency in which functional areas nonprofit management were being covered. Mirabella and Wish had previously identified three functional areas of nonprofit management including outside function, inside function and boundary spanning. These functional areas of nonprofit management were then compared to the 2007 and 2015 NACC curricular guidelines, which is shown in Table 5.

As shown in Table 5, 13 out of the 16 NACC curricular guidelines were covered functional areas of nonprofit management within master's level

**Teaching and Training in Nonprofit Organizations, Table 5** Frequency of nonprofit management function compared to 2007 and 2015 NACC curricular guidelines. (Adapted from Mirabella and McDonald 2013)

| Functional areas of NME | Frequency of functional areas of nonprofit management included in graduate course syllabi % (Mirabella and McDonald 2013) | 2007 NACC curricular graduate guideline categories | 2015 NACC curricular graduate guidelines categories |
|---|---|---|---|
| Outside function | | | |
| Philanthropy and the third sector | 10 | 1.0; 2.0; 3.0 | 1.0; 2.0; 3.0 |
| Advocacy, public policy, and community organizing | 12 | 6.0 | 6.0 |
| Fundraising | 17 | 10.0 | 10.0 |
| Marketing and public relations | 5 | 14.0 | 14.0 |
| Boundary spanning | | | |
| Legal issues | 3 | 7.0 | 7.0 |
| Strategic planning | 4 | 12.5 | 12.6 |
| Inside function | | | |
| Internal management skills (includes leadership, governance, information technology) | 33 | 5.0; 12.0; 15.0 | 5.0; 12.0; 15.0 |
| Financial management | 9 | 9.0; 11.0 | 9.0; 11.0 |
| Human resources (volunteer management) | 6 | 13.0 | 13.0 |
| Not included in course syllabi review | | | |
| Ethics and values | n/a | 4.0 | 4.0 |
| Nonprofit economics | n/a | 8.0 | 8.0 |
| Assessment, evaluation, and decision-making methods | n/a | 16.0 | 16.0 |
| Total | 1749 syllabi | 16 NACC curricular guidelines | 16 NACC curricular guidelines |

course syllabi. Internal management was the largest nonprofit management functional area covered within course syllabi. Ethics and values, nonprofit economics, assessment, evaluation, and decision-making methods were included in the NACC curricular guidelines but not covered extensively within the course syllabi. Mirabella and McDonald's work also shows that there has been an increase in programs in advocacy, public policy, fundraising, and social entrepreneurship. Also, there has been an increase over time in master's degrees including philanthropy history courses.

Other research shows the prevalence of experiential education within NME programs. A comprehensive review of 49 NME master's degree program websites, 405 course syllabi, and 12 qualitative interviews with program representatives, revealed master's level NME programs used a variety of experiential education approaches. These programs primarily used the experiential learning (i.e., a project within a course) approach but further analysis revealed low levels of interactions between students and community organizations.

## Alumni Outcomes

Much has been written about the benefits NME on students and alumni, primarily focusing on master's degree alumni (i.e., Altman et al. 2012; Carpenter and Siefert 2008; Fletcher 2005; Herman

and Renz 2007; Mirabella and Wish 1999). Altman et al. (2012) reported on the perceptions over 550 Nonprofit Leadership Alliance (formerly American Humanics) alumni. Alumni reported high satisfaction with the NLA programming and job prospects after graduation. Carpenter and Siefert (2008) reported outcomes of a longitudinal alumni survey of the M.A. in Nonprofit Leadership at the University of San Diego. The overall alumni satisfaction rate was 95%. Fletcher (2005) surveyed over 645 alumni from three standalone NME master's degree programs. Results showed high alumni satisfaction and more respondents indicating that the master's degree had a positive impact on their career. Herman and Renz surveyed 88 alumni from a master's degree in public administration with a nonprofit concentration. The majority of respondents reported high satisfaction to the nonprofit coursework aiding in their careers. Mirabella and Wish (1999) conducted focus groups with alumni, faculty, employers, and funders from 11 NME programs. Results showed positive effects of the master's degree on the nonprofit community.

In summary, NME alumni research shows that alumni have expressed high satisfaction with their NME experiences. They expanded their professional networks, increased their skill sets which resulted in raises, job promotions, and new job opportunities.

## Current Challenges and Opportunities for the Future of NME

There has been much growth of number of NME programs, number of full-time faculty teaching in such programs, as well as alumni satisfaction over the last twenty years; however, there are still many challenges and opportunities that lie ahead.

NME programs have been slow to integrate multiple disciplinary perspectives in its courses. Curriculum is primarily focused on the discipline in which the course, certificate, or degree program is housed (i.e., degree programs housed in schools of public administration are still very focused on public administration and rarely have a multisector or multidisciplinary approach).

In addition, scholars have discussed the tensions between teaching theory and practice and NME curricular content (Burlingame 2009). Burlingame emphasized that programs need to emphasize management and the liberal arts. He said,

> It is important to have a curriculum that provides the knowledge of philanthropy and the nonprofit sector, and the tools that lead students to appreciate the role society played by the organizations they work; how the organization mission is carried out effectively; and how resources –human and financial – are gained and applied to actualize the mission of the nonprofit. (2009, pp. 60–61)

There still remains a strong tension between programs housed within arts and sciences, public administration, and business. The tension stems from the balance of teaching the necessary skills needed to run nonprofit organizations and the theory behind why nonprofits operate the way that they do. Burlingame also said, "The curriculum feels like a hodgepodge of skills courses will a lot of things to do with little theoretical integration" (Burlingame 2009, p. 64). However, the counter argument that some business scholars believe is that the liberal arts has minimized teaching the daily operations of running an organization.

Another tension has to do between the ratio of full-time and part-time faculty members. As NME programs are becoming accredited, these programs are increasing the number of full-time faculty. The increased publication requirements for tenure, impact factor ratings, and required publishing in specific journals is causing full-time faculty to decrease their teaching focus and spend less time on collaborating with community, which is a digression from how many NME programs were created.

Another issue has to do with the fact that many programs provide little internationalization integration into the curriculum. International concepts and globalization discussion varies by program focus and program location. Although there are many international NME students, many degree programs lack integration of global concepts. In Burlingame's (2009) article, he said: "In 1999 John Palmer Smith predicted by 2016 we would still have a vital nonprofit sector in the USA but

that there would also be global expansion of the sector" (p. 66). Palmer Smith's assertions are correct but little has been done to seize globalization opportunities within the classroom setting. The majority courses and programs discuss running a nonprofit within the United States. The two main associations that nonprofit researchers and academics participate in, The Association for Research on Nonprofit Organizations and Voluntary Action (ARNOVA) and the Society for International Third Sector Research (ISTR), have a strong international focus, but more can be done to integrate international nonprofit management concepts into NME curriculum.

In a recent article in the Nonprofit Quarterly, Millesen explains opportunities for the future of NME programs. She says:

> Today's programs lack attention to the broader context in which ... skills might be deployed to improve conditions in communities and accomplish real change. Programs need to teach students:
> 1. How to establish an organization's community value,
> 2. How change happens,
> 3. How to work in a group/collaboratively, and;
> 4. How to select organizational structure and business model that fits the situation. (2014)

She explains there is a large disconnect between the kind of learning NME students expect to emerge with and what is being taught. These "soft skills" of change are not taught in the majority of PhD programs. The NME programs that excel at teaching soft skills tend to bring in full-time and part-time instructors from other disciplines.

In summary, NME programs in the future must cross multidisciplinary and multisector boundaries. Programs also need to integrate theory and practice, adapt to the changing student population, and internationalize their courses. Furthermore, today's students want to be actively involved in their learning inside and outside of the classroom environment.

## Conclusion

This entry discussed the historical development of NME, location and types of degrees offered, faculty demographics, course topics, alumni outcomes, as well as current challenges and future opportunities for NME in the United States. In summary, over 340 NME courses, certificates, and programs that offer NME have emerged in the last 50 years. These programs are taught by faculty who vary in their academic background, expertise, and full-time or part-time status. In addition, these programs are housed in variety of different disciplines and schools in universities across the United States. The diversity of academic disciplines makes course content and topics vary within NME programs, and as a result, programs must be cognizant about how the discipline where the program is housed influences the course curriculum offerings. More multidisciplinary perspectives and a balance between part-time and full-time faculty may help mitigate the theory and practice tensions.

# Teaching Ethics in Public Administration

Christine A. James
Valdosta State University, Valdosta, GA, USA

## Synonyms

Course material; Ethics; Pedagogy; Standards; Values

## Definition

Teaching of values and procedures that are relevant to the novice public administrator.

## Introduction

The teaching of ethics in public administration is a field that has grown considerably over the last 40 years. This is because of concerns within educational institutions that offer the Masters in Public Administration (MPA) and Doctor of Public Administration (DPA) graduate degrees, as well as the belief that citizens beyond the profession hold that public administrators must be accountable, must act in ways that are transparent and public, and must keep to a high standard of ethical behavior. To this end, professional organizations like the National Association of Schools of Public Affairs and Administration (NASPAA) have asserted the importance of ethics in the pedagogical structures of MPA, DPA, and PhD programs, and a large number of philosophy and political science departments offer undergraduate applied ethics courses on Ethics in Public Administration and Ethics in Public Policy. There are a variety of specific areas to consider: the student audience, the ethical theories and values that are included, and the case studies or dilemmas that students use to practice their decision-making methods and keeping the course relevant and current to the professional life of public administrators currently working in the field. Courses in ethics in public administration are frequently the first step to a broader sense of professionalization for the student, as well as an opportunity to address a deeper set of values and concerns beyond administrative or bureaucratic procedures.

## The Student Audience

There are a variety of students taking courses in public administration with a wide range of motivations. Some students will be future public administrators, working or elected into governmental organizations. Other students will be

future public administrators in private sector organizations. A third group of students are those interested in ethics and philosophy, seeking a new set of applications and ways to use ethical theories. There will also be students who are interested in pursuing careers as professors, academics, or researchers in higher education. At public state universities, all four groups frequently take upper level undergraduate and first year graduate student courses on Ethics in Public Administration. This heterogeneous variety of students in ethics in public administration reflects the growing popularity of Masters in Public Administration (MPA) and Doctor of Public Administration (DPA) graduate degree programs as a path for undergraduate majors in philosophy, political science, and business administration.

A historical timeline of Ethics in Public Administration:

| | |
|---|---|
| 1970s | Approximately 12 Masters in Public Administration graduate programs added ethics instruction and/or entire ethics courses into their curriculum |
| 1978 | US President Jimmy Carter signs the Ethics in Government Act, which addresses federal employee's standards of behavior and duties to serve the best interests of the American public The NASPAA member survey of MPA programs finds that 43.3% of programs that responded to the survey reported that their program includes one course on ethics |
| 1980s | Approximately another 10 MPA programs add ethics instruction and/or courses |
| 1984 | The American Society for Public Administration (ASPA) adopted an ethics code designed to raise ethical standards and practices among ASPA members |
| 1986 | First edition of David H. Rosenbloom's *Public Administration: Understanding Management, Politics, and Law in the Public Sector* |
| 1988 | The NASPAA created curriculum standards with specific language that public administration programs must "enhance the student's values, knowledge, and skills to act ethically and effectively" |
| 1988 | Major study of ethics in public administration courses, making a distinction and a progressive shift between courses focused on bureaucratic ethos and courses focused on democratic ethos |
| 1995 | NASPAA member survey of MPA programs finds that 60% of programs that responded to the survey reported that their program includes an offered ethics course |
| 1997 | The fourth edition of Simon's classic text entitled *Administrative Behavior* is published (50 years after the first edition) |
| 1997 | Studies completed on "conceptual diversity" in Ethics in Public Administration and on the significance of coursework in Ethics in Public Administration during the careers of public administration degree graduates |
| 1997 | Peer-reviewed literature provides specific case study methods for addressing ethical dilemmas in public administration |
| 1997 | H. George Frederickson publishes *The Spirit of Public Administration* |
| 2006 | The ASPA makes a special call to scholars and teachers of public administration via Public Administration Review to engage in a stronger research and education agenda to enact deliberative and participatory governance in the next generation of administrative leaders |
| 2009 | *Public Administration Review* publishes a special Supplement to volume 69 on Comparative Chinese/American Public Administration, including an article describing paradigm shifts in the teaching of public administration in the two countries by Xun Wu and Jingwei He |
| 2009 | Raymond W. Cox III publishes *Ethics and Integrity in Public Administration: Concepts and Cases* |
| 2010 | Public Administration Review includes a special volume on the "Future of Public Administration," recommending, for example, that the pedagogy of public administration must include values of environmental, economic, and social/political sustainability |
| 2014 | Eighth edition of David H. Rosenbloom's *Public Administration: Understanding Management, Politics, and Law in the Public Sector* with coauthors Robert S. Kravchuk and Richard M. Clerkin |
| 2014 | The American Society for Public Administration celebrates its 75th anniversary, having begun in 1939 |
| 2015 | As of September 2015, 192 programs in public administration at 178 schools are accredited by NASPAA |

As the variety of students in Ethics in Public Administration emerges, there are usually three different concerns for any particular course: (1) giving students a sufficient background in ethical theory and value theory, both from the perspective of the history of philosophy and the

context of political parties and their discussion of "values"; (2) addressing specific case studies, dilemmas, or examples of real practice in which ethics and values are relevant and helpful; and (3) helping students to connect ethics and values to "professionalization" as a future public administrator. Most professors who teach these courses will agree that there is no one right, or best, way to teach ethics. It follows then that a variety of different methods and approaches are often used over the course of a semester. This piece tries to clarify some of those different approaches and how they can be used to give future public administration professionals insight into their own careers and their own decision-making skills.

## The Ethical Theories and Values

One way to begin a course on Ethics in Public Administration is to begin with key terms and definitions from the history of philosophy. For example, a course might begin with a unit discussing Aristotle, Kant, and Mill. Note that some texts will discuss the philosophical ethical theories with relation to key terms, rather than individual philosophers' names: for example, Kant can be referenced in terms of deontological ethics and rules; Mill can be referenced in terms of the common good, consequences and results of policies, common goods, public good, or teleological ethics (Rosenbloom et al. 2014, 13, 521; Rushefsky 2013, 34–39). The key terms, and the central tests for ethical decision-making, in each theory are introduced and then related to situations involving public leadership. For example, Aristotle's discussion of virtue in the Nicomachean Ethics, and the concept of the Golden Mean, could be used to address a courageous decision on the part of a city councilman who must expose corruption. Immanuel Kant's categorical imperative and good will could be explained and then related to a mayor who has a duty to tell the truth about his community's budget, in spite of the possibility that her popularity will decline (Cox 2009, 18–19). The theory of utilitarianism discussed by John Stuart Mill, and its emphasis on the consequences and results of actions, could be used to address a local school system struggling to fund arts and music programs (Svara 2007).

In many courses, after the historical ethical theories are addressed, the theories can then be related to major political party positions on specific issues. For example, the first chapter of Rushefsky (2013) includes a discussion of liberal, conservative, libertarian, and populist views. Each view can be related to government intervention or nonintervention on social and economic issues. For example, conservatives might appeal to Aristotelian virtue theory when they argue in favor of government intervention on social issues. Liberals often appeal to utilitarian ethics for the sake of economic equity and progressive business practices. One strength of this approach is that a relationship between ethical theory and specific practices is set up from the beginning of the course. Two disadvantages to this approach can also occur: students who are already convinced of a particular point of view may simply disregard ethical theories that are not immediately associated with their political party of choice, and philosophy students may find that a quick introduction to Aristotle, Kant, and Mill is too shallow or inaccurate. This is certainly a pedagogical choice to be undertaken carefully, as there will undoubtedly be a major difference between a course applying ethics to public administration and a full course specializing on the ethical theory of Kant.

Another advantage to approaching Ethics in Public Administration with a brief introduction to a variety of different ethical theories is that such an approach preserves "conceptual diversity." A majority of scholars note that today's applied ethics courses do not, and should not, try to impart a set of moral truths. Rather, such courses are to give students a specific set of skills: to be perceptive about detecting ethical problems and disagreements, to be well acquainted with a variety of moral thoughts and perspectives, and to be able to use reason to analyze and address ethical dilemmas. In introducing a metaethical, comparative perspective between ethical theories, we invest the students in making arguments for and

against specific ethical virtues, duties, and consequences.

The useful concepts of moral equilibrium and reflective equilibrium are another benefit to the ethical theory approach. Reflective equilibrium involves a process of deliberative mutual adjustment, and moral equilibrium is this deliberation as it relates to our ethical choices and our ethical self-understanding. For future public administrators, this process is not only valuable but necessary. By introducing major historical ethical theories, the deliberative process regarding specific cases begins in a natural way. In terms of specific pedagogical techniques, A variety of specific pedagogical techniques, including in-class discussions, debates, and presentations can be created that require students to compare and contrast different ethical theories' solutions to dilemmas. For online courses, discussion boards can be set in which students post their own application of a theory to a dilemma and other students critique, grade, rate, or otherwise react to their fellow students' work. Such exercises provide not only an opportunity to discuss and reinforce specific ethical theories but also provide a chance for students to sharpen their own skills of self-expression and argumentation.

Some public administration texts, especially those that focus on the United States, also include discussion of pragmatism and public policy, coming from a perspective such as John Dewey's discussion of public education or William James on religious belief and psychology. Philosophers will note that such discussions often involve a conflation of "pragmatic" decision-making with "pragmatism," two closely related terms that actually refer to different practices. One can emphasize the significance of pragmatic thinking in specific traditions, and one can trace the history of the tradition to George Herbert Mead's discussion of the individual in their environment and to Aristotelian circumstantial ethics. The broad lesson that this approach successfully teaches is that specific circumstances and conditions should always be carefully enumerated and analyzed as a part of an administrator's decision-making.

A third popular approach to ethical theory as an entry point into public administration is the work of social contract theorists, such as John Rawls, and entitlement theorists, such as Robert Nozick. The Rawls approach has the advantage of taking the concept of justice and clarifying it directly with specific principles to be followed, such as equal access to specific opportunities and maximizing specific liberties and benefits to society, with intriguing thought experiments in the original position. Nozick has an appeal for students who are familiar with arguments against government intervention on economic issues and arguments against increases in taxation. The disadvantage of this approach is that both Rawls and Nozick are emphasizing "distributive justice," the way that economic status, goods, wealth, and other benefits are portioned out in society from the beginning. Their theories give less attention to retributive justice, in which wrongs are addressed, the guilty are punished, or some plan of reconciliation and restitution is reached. Since public administrators working in the context of government agencies will probably engage in policy decisions related to punishment (e.g., in the context of prisons and criminal justice policies and procedures), the inclusion of additional material related to retributive justice is recommended.

In any case, each ethical theory, or justice theory, can be used as a framework in which a variety of case studies or dilemmas can be addressed. The connection between theory and practice, between theory and cases or dilemmas, is a nearly universal feature in courses on ethics in public administration.

## The Case Studies or Dilemmas

Case studies or dilemmas are profoundly important in applied ethics coursework. In analyzing a case, we invite students to simultaneously take on the roles of the characters in the case study and address their ethical obligations, duties, and virtues. In the case of duties of beneficence and duties of non-malfeasance, a case highlights characters who are tempted to act in specific ways that would go against or serve such duties. We give the students a scenario in which they can give consideration to a point of view other than their own,

which engages the student in ways beyond memorization of theories, concepts, and facts. Student success often depends on the student's engagement and the feeling that the material of the course has relevance to the real world. Case studies or dilemmas are uniquely able to convey this for students in ethics in public administration.

Case studies or dilemmas for ethics in public administration courses can vary in complexity and length. It is recommended that such cases be written in a clear and direct narrative, with a set of events involving more than one administrative relationship. For example, a board of trustees member may be making a decision reviewed by other elected officials as well as a hired economic development director. Each character in the dilemma can have various interests, understand the end goal in different ways, and have different understandings of their relevant duties. Cases can also be written to be universal in terms of time and place (a hypothetical city in the recent past) or with a variety of specific details related to economic conditions at a particular place and time (e.g., the market crash of September 2008).

After a rich case is created, it is helpful to give a specific method with a series of steps that the students can follow in making an ethical resolution. There are a variety of exemplary methods for analyzing case studies in courses on ethics in public administration. Case studies address a variety of specific responsibilities, duties, and obligations. These obligations and duties can often come into conflict, a fact which the American Society for Public Administration acknowledged in 2006, calling for a stronger emphasis on deliberation and collective conflict resolution skills in public administration course work (American Society for Public Administration 2006, 169). In order to make students break out a set of specific constituencies and relevant obligations, a grid or matrix with specific decision points can be used, with students proceeding to fill in specific sections of the matrix. Certain duties to a state contractor may be referred to in one portion of the decision process, for example, and specific actions on the part of the public administrator can be compared with what the "normative matrix" says for that portion of the process. Within each portion, specific priorities can be established and ranked, which invokes a quantitative utilitarian approach to the dilemma. Frequently, cases and dilemmas include a detailed discussion of "cost-benefit analysis." In terms of philosophical theories of ethics, there is a distinct way in which costs relate primarily to utilitarian consequentialist ethics, and benefits relate to specific duties that particular administrators are expected to instantiate.

## Keeping Ethics in Public Administration Relevant to Professional Life

It is important to note that over the last 40 years, the number of programs granting the Masters in Public Administration and the Doctor of Public Administration degrees has increased dramatically, and the number of programs including ethics training and whole courses on ethics in public administration has also increased. The professional organizations like the NASPAA have made a concerted effort to endorse, support, and require such courses. The courses frequently include students who are philosophers, political scientists, as well as traditional MPA/DPA students. In terms of the professional value of the courses for the MPA/DPA, they give students a chance to address an ethical dilemma before they are in a position of sole responsibility for their decisions, and it gives them a methodology for addressing difficult situations when they arise in their professional life.

A perennial question in the literature on teaching ethics in public administration is whether or not teaching ethics makes a difference in the lives and careers of public administration graduates. Since the 1990s, there have been regular surveys and qualitative reports on past graduates of MPA programs to discover what ethical dilemmas they had faced in professional life and whether or not their ethics training had been helpful. A definite niche in public administration programs for ethics training has been established and that there is a positive difference being made, but it is limited. For example, in a 2009 article describing the different approaches to public administration courses in the United States and China, the variety

of approaches to public administration was argued to both increase the breadth of research in public administration and to also create intense debate between divergent paradigms (Wu and He 2009, S21). Frequently, social pressures and negative aspects of favoritism intrude on ethical deliberation. The concept of impartiality as discussed by Immanuel Kant can be difficult to overcome. Another set of influences comes by way of the Internet and social media, in which decisions of public figures are frequently discussed and criticized quickly and harshly. Accountability and transparency are two of the overarching and highly important values relevant to the career of any public administrator. Currently, professors teaching ethics in public administration must balance a variety of paradigms and theoretical approaches in order to impart professional skills and give their students the ability to adapt to the global and multifaceted environments in which they will use those skills (Wu and He 2009, S26).

In the 1990s, ethics in public administration courses were evaluated. Many courses were built around either a democratic ethos or a bureaucratic ethos. At the time, these approaches were seen as most relevant to the daily practice of public administrators in the workforce. The bureaucratic ethos upholds the standards and values of managers and the standards and values that managers appeal to in operating as government officials. The democratic ethos appeals to broader values, like constitutional values, the public interest, and social justice. One example of these two approaches in a textbook from the 1990s is H. George Frederickson's The Spirit of Public Administration, published in 1997. Although this distinction is still reinforced in many textbooks on ethics in public administration and ethics in public policy, there are a variety of other approaches or ethoses that are more specific and relevant given the current global context. For example, the concept of sustainability has been recommended by Daniel Fiorino as the necessary focus for the future of public administration as the field approaches to the year 2020. His argument attempts to be comprehensive by including both the concept of sustainability in the environmental sense and economic and social/political sustainability (Fiorino 2010, 583). The perceived tension between environmental sustainability and economic interests is one of the most significant challenges for future public administrators and scholars.

## Conclusion

The teaching of ethics in public administration normally includes a selection of ethical theories, political values, and specifically constructed case studies and ethical dilemmas. A well-constructed course includes a variety of information on ethical theories and a set of activities with specific processes and procedures that give students a chance to practice handling scenarios before they are in their professional role and individually responsible. For philosophy students, courses in ethics in public administration give an opportunity to apply ethical theories in unique conditions. For political science and public administration students, courses in ethics in public administration provide an opportunity to think beyond the level of bureaucratic policies and procedures and to address the vocation of public administration as a way to live out a deeper set of meaningful values and goals.

# Team Coordination in Crisis Management

Melissa Pinke
Jacksonville State University, Jacksonville, AL, USA

## Synonyms

Activation; Emergency; Emergency response teams

## Definition

The ability to prepare, implement, and execute a committed, well-trained group, in response to an imminent or potential damaging situation to resolve problems and minimize impacts.

## Introduction

Employees engaging in emergency response activities must function as a team for effective results. Teamwork requires individuals to take on specific roles and to depend on each other fulfilling their obligations in that role while addressing a problem or a mission. A successful team, one that can respond to a crisis and create a positive outcome, is not difficult to create; however, it does take commitment, training, and the ability of the team members to develop skills together in order to function as a unit. This entry covers some of the key considerations to create, develop, and coordinate a successful emergency response team.

## What Is a Team?

A team is considered "An energetic group of people who are committed to achieving common objectives, who work well together, enjoy doing so, and who produce high-quality results" (2001, p. 124). According to experts, individual capabilities alone do not make a group a team (Walker 2009; Salas et al. 2008; Miller et al. 2008). There must be more than just putting employees in training classes or handing them a procedure manual and expecting that during an emergency, when potentially life-threatening situations are occurring, responders will both remember and be able to execute appropriate actions smoothly while under stress. In emergencies, responders each fill a unique role. Each person depends on the others performing their tasks. Problems develop if roles are unclear, or if more than one person assumes the same role, or if a role is not filled. Safety can be compromised and errors can increase.

Emergency management within an agency may be built on teams that manage the overall emergency plan or that deliver direct services to employees, like first aid or evacuation assistance. At the community level, public safety agencies operate as teams and may have specialized units like hazardous materials teams. At the state level, the National Guard responds as a team to enhance local capabilities or bring specialized competencies, such as medical response teams.

## Teamwork

Effective teamwork is not automatic (Burke et al. 2004). Sports teams go through extensive

training long before competitive games begin. While each individual must join the team with some basic talent and skills, there is more to teamwork than the individual application of tasks. Several scholars point out the value and necessity of ensuring that all members can function within a team. It is well established that teams make fewer mistakes than do individuals (Miller et al. 2008). Therefore, it is beneficial to develop emergency teams to be ready to respond to a crisis.

Often, during a disaster, the National Guard is called in to assist. Their strengths include their numbers, skills, and ability to work as a team to get things done. During a crisis, an emergency response team must be fully prepared, engaged, and able to respond as a unit to effectively deal with a situation, just like the National Guard, but with an emergency management approach at the organization level.

## Organizational Culture

Organizational culture also influences the ability of emergency teams to be prepared and function during response. The success of response is based on the teams' capabilities to assess and respond accordingly. Without a positive culture, there may be little availability or incentives for employees to participate in training to learn proper assessment and response capabilities or to participate in exercises to develop skills and knowledge. Without reinforcement with practical applications, employees may not develop skills necessary to carry out response measures or have confidence to make decisions to initiate response activities, especially if they are concerned with their own safety. Effective emergency team response and coordination is more likely to be achieved when there is a culture that supports learning and the use of a team for response capabilities.

Switching from an autocratic, dictatorship, or controlling management style where only a few people make decisions to allowing a team to respond and make decisions is often challenging. This first requires confidence in the team's leadership skills and abilities, along with the capabilities of the group to allow them to function independently. Having enough employees trained, prepared, and ready to respond with the right equipment in sufficient quantities is an essential component of emergency response team capabilities. It is unlikely to achieve this level of preparedness without the full commitment of senior management and a culture that supports and encourages program development and exercises.

Team sponsorship by a senior manager is also essential. This individual must also engage the team routinely and ensure that resources are available. This support is best if the senior manager has some accountability for the team results. Team review and recognition should be part of the meetings and the team development. Without senior management sponsorship, team effectiveness will be limited. High-performing teams are made (Burke et al. 2004), and teamwork is a necessary component (Burke et al. 2004). Senior management is responsible for ensuring that all team members are engaged and that teamwork is occurring. This will lead to better results.

## Team Leadership

The team leader has an essential role in the outcomes of the group. The team needs to be able to rely on the leader's actions and words as good intentions for the team, as well as between team members. If the team members do not believe that the leader has their best interest at heart, members are unlikely to carry out the roles specified. Leaders are often judged on past performance, and the reflection of the team is measured on the leader. Team member talent is also an important determinant of team performance (Dirks 2000).

The right leadership is needed throughout development to form into a successful team (Walker 2009). Leaders establish team norms, set performance guidelines, create a feedback mechanism, work with people from different backgrounds, take personal ideals into account, and foster a working environment so all members

feel free to state and discuss their opinions among the group, especially members whose opinions differ. Creating an environment where staff members can come to consensus to achieve the required end state is vital for a group to become a team. If a team is to be successful, unit proficiency will come from a well-developed process allowing members to understand tactics and can operate, move, and communicate together. A retired military leader emphasized this point, "Four good platoons do not make a good company, but the leader who can take those four good platoons and turn them into a team with a single purpose will have a great company" (p. 8). Team leaders establish the environment for productive group response capabilities.

## Team Knowledge and Skills

Ensuring that enough staff members have the right knowledge and skills to respond quickly can improve outcomes. There must be a sufficient number of employees trained and available to support response capabilities on all shifts. Team members must also have the ability to work well with others, and it is critical that frontline staff can identify the signs of a potential emergency situation and can take immediate steps to activate proper response measures and additional teams if an event occurs. While these individuals that identify triggers or potential situations may not be considered part of the team, they should be.

On an individual level, there are several attributes to consider when selecting team members. Skills, personal familiarity with past positive performance, cooperation, creativity, positive attitude, good work ethics, and willingness to learn or try new things are essential. Avoid those individuals who are combative or confrontational, even if this individual is the most skilled, as these attributes will negatively affect the team dynamics. For crisis or emergency response, the abilities for sound decision-making, rationalities, calm demeanor, and the willingness and ability to take actions are also essential to consider. In a crisis situation, problem-solvers, communicators, planners, and doers are needed.

Effective training must be a key component of the emergency plan so individuals can recognize indicators and take appropriate steps. This training must include methods to improve the team response approach. There is a need to integrate new skills and knowledge learned within the organizational emergency response program to ensure a basic competency, especially since large-scale events occur infrequently. Periodic exercises help maintain proficiency and confidence. This application and maintenance of skills and knowledge will reduce anxiety, improve response outcomes, and protect the employees, occupants, and facility during a large-scale or crisis event. It is necessary to train together for operability, understanding each other's roles and priorities for various types of events, and to prepare for the unexpected with those that are likely to be a part of the response process. Training must also include a clear definition of their role that everyone understands, including management and other employees. Everyone must know that the team exists, how they are activated, and their function and capabilities.

## Team Building

Team building is effective for improving team outcomes, processes, and performance. There is a positive relationship between team building and team functioning. Most importantly team building not only helps improve interpersonal relations within a team but also helps improve process. Team building is about building better and stronger relationships, developing a sense of a common purpose and unity, boosting morale and motivation, and encouraging communication, while supporting the psychosocial well-being of team members (Oxfam 2007).

Furthermore, teamwork is more than knowledge; it also includes behavior and attitudes. Therefore, team training must include more than conveying knowledge but also include time for either simulation or role-play of new

skills and developing interpersonal relationships. Team building is necessary to develop a comfort level and trust among members.

## Effective Teamwork

For a team to work effectively, the members need to be personally acquainted. Knowing each other's names, calling each other by name comfortably, and the ability to voice opinions to contribute to the group outcome without fear of reprisal are essential to team outcomes. Effective teamwork does not come from just sitting in a classroom but from developing working relationships. Team members must also have a feeling of confidence and understanding of both individual members abilities and limitations, as well as the capabilities of the group as a whole (Sheng et al. 2010).

Trust is a major component of successful emergency response teams. There are many definitions of trust. Spector and Jones (2000) state that trust is an expectation or belief that actions from another person will be motivated by good intentions. Costa (2003) states that trust is a willingness to be vulnerable, combined with the expectation of good behavior from others when there is task interdependence between individuals, which in turn, is related to the willingness to engage in cooperative actions and depend on others. Risk is often a prerequisite in the choice to trust, whereby the actions of others would be considered at least not detrimental and preferably beneficial (Costa 2003; Dirks 2000). Trust can also be described by a high degree of social conduct and frequent social interactions, whereby two parties care about each other, exchange information, and may even share personal information (Sheng et al. 2010). Trust is a key component in all interpersonal relationships and particularly important for emergency response teams (Oxfam; Sheng et al. 2010).

In the workplace, an employee's perception of his or her perceived status, individual identity, potential or actual involvement in contentious relationships, and/or acceptance can facilitate or hinder the ability to change the behaviors of others. People may completely refrain from discussing their ideas with the other group members because they are afraid that their knowledge may be inadequate or unimpressive and fear loss of ownership and/or the loss of individual competitive edge. The acceptance of an idea is dependent on the trustworthiness between the interpreter and potential recipient, and this knowledge transfer may be less effective if the exchange is unpleasant for both sides. Innovations may not be accepted simply because of the person who proposes them, rather than the content. This has been shown to be the case where newcomers bring ideas to the group; however they may not have earned the confidence and status of the group to convince them to change (Schilling and Kluge 2009). Personal trust is linked to cooperation, performance, and quality of communication in organizations. Working well together requires some degree of trust, and the type of work encounters that occur in today's organizations requires trust to be formed rather quickly.

Information is a critical component in emergencies, yet lack of trust will inhibit communication (Costa 2003). Especially for infrequent, high-cost events, response teams must be willing and able to speak up; this relies on trust that what they say or do will not cause reprimand or be held against them. This is especially important when team members do not all hold the same rank (Miller et al. 2008).

An essential foundation for trust between team members is competence in individual skills and roles, which comes from education, training, and practice. Training and practice improve skills, builds competence, and increases trust between team members. This is where an individual's skills become important; however, in order to ascertain if an individual has the proper skills, the skills must be demonstrated in action for the rest of the group members to see and affirm. The willingness of individuals to work with others is also measured during practice. Practice is a much better time to determine the workability of a group.

Trust is also a key factor for cooperation in teams. Where there is a lack of trust, there will

be failings in communication, delegation, quality, and empowerment (Erdem et al. 2003). While other variables impact team effectiveness, such as how long the team has been together, specific personal attributes, and the influence of organizational culture, unit cohesion needs time to develop. For employees to respond to an emergency, they need not only knowledge of procedures but also the ability to respond effectively as a team, functioning as part of the overall system of response. Building trust needs to be considered when developing policies, procedures, team selection, training, development, and supervision (Erdem et al. 2003).

## Team Activation and Response

Once a team has developed skills and can function as a single unit, they are ready for response. Activation procedures should be part of training and exercises. The team leader should be the one to activate members. Ideally a realistic alert should go out to members. If there is a potential for an emergency to develop, the team should be alerted and put on standby to respond. This can increase both their mental and physical ability to respond should they be needed. There should be a way to confirm that each team member received the message and can respond so there are no gaps left. With the need for redundancy, the notification must ensure that there is team coverage without duplication. Team response to the alert must be well known and practiced, including meeting points. Briefings and frequent updates should be made, both to active team members and those on standby. An official deactivation should also be made when the situation is over, so that it is clear that team response is no longer needed.

In a team, each member has a specific role to carry out, and trust is what allows each member to do so. It is the leader's responsibility to ensure that roles are being executed, communication is open, and difficulties are resolved. During activation, leaders too must evaluate team members for signs of stress or fatigue and initiate steps to ensure the well-being of each member.

After each event, whether a drill or real, the team should debrief. Reflection on personal feelings as well as performance needs to be considered to avoid burnout and make improvements. While most people will deny the need for assistance, ensure that there are outlets to release stress and talk about the situation. For individuals who appear to have more serious or long-lasting negative impacts, arrange for critical incident stress counseling. Recognizing the team is also important. Public recognition will go a long way to promote the team. Any lessons learned should be incorporated into policy and procedure and practiced by team members, thus ensuring the cycle of improvement.

## Conclusion

While many leaders assume their organization is equipped to bounce back after a disaster, without a focus, a team, and a plan, it is unlikely that resilience will happen. Effective team coordination for a crisis begins long before such an event occurs. There needs to be a true willingness by management to put the necessary components of an emergency preparedness program in place to support the team. The right people with the right skills and demeanor need to be included on the team. Training and skill development are needed, while a camaraderie must be fostered within the group. The ability for each member to trust and work with other team members is essential. Team response includes notification, activation, and use of necessary equipment. The team must be allowed to function within their role, with a strong leader in charge. Follow-up, recognition, and continued improvement are necessary to sustain team success.

## Synonyms

Contingencies in team leadership; Functional leadership; Team needs; Team process

## Introduction

Teams are prevalent in today's organizations. Very few weeks pass without the majority of employees spending time in collective effort. As today's knowledge workers are often involved in complex tasks that require multiple areas of expertise and intelligence, the use of teams has become inevitable in the workplace. Several studies have also demonstrated that the collective decisions are better than individual decisions. Organizations may choose different types of teams, such as project teams, virtual teams, cross-functional teams, or self-managed teams, depending on their needs and goals (Meyer 2015).

As teams have evolved, so too has team leadership. When teams have appointed leaders, often at the managerial level, these leaders may share leadership with members or take on a facilitative leader role. Other teams may be led internally by the members. This way of working requires skills in collaborative work practices. This chapter provides an overview of team leadership that includes team leadership functions and processes, contingencies and challenges, and recommendations.

Definitions of team and team leadership will be first presented in the following section.

## Definitions of Team Leadership and Its Emergence

A *team* can be defined as a group of two or more people with different sets of skills or functions who perform together collaboratively and interactively toward a common goal. According to this definition, a team needs to focus on two areas to lead to collaborative performance achievement: dynamic interaction and shared goals. Furthermore, teams as work-units need to be composed of a number of relatively independent individuals who have specific and unique competency to perform collaborative team outcomes (Garrison 2014).

It is notable that teams are different from groups in that team members share responsibilities and behavioral norms, have specified duties and roles, and interact and are interdependent to each other with the aim to accomplish collective goals, whereas a group can be formed simply due to the similar traits, characteristics, or interests of members (e.g., ethnic background, reading, and gardening clubs). Thus, not all groups are teams. The most effective teams (1) assign individual tasks based on a shared understanding of each member's strengths and weaknesses; (2) understand priorities and member tendencies; and (3) establish consensual processes for decision-making and conflict resolution (Chantham 2016).

Leadership is one of the most essential elements for maintaining and supporting overall work practice. Since teams are receiving more autonomy-related support from the organization, leadership is required to manage and support team practices. The term *team leadership* refers to the ability to direct and coordinate the activities of other team members; assess team performance; assign tasks; develop team knowledge, skills, and abilities; motivate team members; plan and organize; and establish a positive atmosphere (Sonesh et al. 2013, p. 213). Team leaders need to create favorable environments that satisfy critical team needs so as to enhance team effectiveness (Morgeson et al. 2010a).

In addition, one of the core team leadership factors is the integrative process, which helps align each individual's needs, expectations, goals, and competency based on the convergence of individual diversity. Ultimately, team leadership needs to utilize individual talents in ways that help to achieve collective goals. From this standpoint, team leadership could be categorized into two primary perspectives: vision sharing-based process effectiveness and collaboration-based member integration. Practically, any team member could take on the role of team leadership as long as these two emphases could be activated. However, working well together does not always, or even usually, come easily. Members need to develop skills in group facilitation (Kolb 2011).

According to these definitions and the core factors of team leadership, team leadership could be defined as a shared team role in a social influence process to promote effective team performance based on the integration of team members' specific characteristics, different expectancies, and various needs.

## Team Leadership Functions and Processes

### Team Leadership Functions

Effective team leadership processes involve defining collective goals/missions and structuring and managing the team, and those processes determine the effectiveness and the development of teams Functional leadership theory, one of the most well-known team leadership models, informs that, in order to maximize the team's success, a leader must perform leadership functions in four behavioral dimensions, implemented in a situated social context: (1) information search and structuring; (2) information use in problem solving; (3) managing personnel resources; and (4) managing material resources (Santos et al. 2015).

The first dimension of the leadership functions refers to the leader's actions to gather, organize, and evaluate accurate, useful, and relevant information in respect to goal establishment and achievement. The directives and guidance

decided upon, based on the gathered information, are also to be provided to team members with a sense of what results are expected and why those are important. The second dimension represents the leader's application of the acquired information to identify existing or potential problem areas, devise effective plans with others for problem-solving, and communicate information and plans to team members. The third and fourth dimensions are related to the leader's implementation of developed plans. The relevant actions include developing and motivating personnel resources and securing and maintaining material resources.

In their meta-analytical study, Burke et al. (2006) proposed a framework in which the leadership functions manifested by the specific leadership behaviors (i.e., task-focused and person-focused) influence team performance outcomes in terms of team effectiveness, team productivity, and team learning and demonstrated their positive associations. Person-focused leadership behaviors accounted for more variance than task-focused leadership behaviors in team performance outcomes. Notably, their subgroup analysis revealed that leaders' empowerment-related behaviors such as coaching, monitoring, and feedback explained 31% of the variability in team learning.

Team leadership processes are fundamentally oriented around working well collectively. It is important for leaders to comprehend team needs so that they can implement appropriate actions or interventions that change and affect team effectiveness. Functional leadership theory also suggests that the leadership role emerges from team needs. Regardless of the specific leadership sources (e.g., informal or formal and internal or external leadership), the purpose of team leadership is to satisfy or fulfill critical team needs. Several researchers (e.g., Morgeson et al. 2010b) have provided useful frameworks for understanding team processes or team needs in accordance with team performance cycles and for delineating the role of leadership in facilitating those processes.

## Team Processes and Needs

Teams perform over time in the temporal, recurring cycles of goal-directed activities that can be divided into the transition phase and action phase (Morgeson et al. 2010b). During the transition phase, the team is engaged in planning activities to accomplish a collective goal such as structuring the team and evaluating the team's performance. At this stage, the team needs to clarify missions and objectives; formulate task performance strategies, roles, and group norms; and identify resources and constraints. The action phases are times when the team is focused on implementing planned actions or activities that directly contribute to goal accomplishment. Needs arising from the action phase include monitoring progress toward task completion, tracking available team resources and environmental cues, and coordinating the sequence of actions with extensive team communication. Moreover, throughout the repetitive cycle of action and transition phases, interpersonal needs must be addressed for a team to be effective. Interpersonal needs include managing possible conflicts among team members and team emotions; generating motivation, accountability, and team cohesion; and building a sense of psychological safety.

Team leadership influences four types of team processes that need to be addressed for team effectiveness: cognitive, motivational, affective, and coordination (Salas et al. 2008). As for team cognitive processes, effective teams share a common understanding among team members that directs their individual/collective behavior patterns (i.e., shared mental models) and collectively monitor or reflect on the progress and outcomes of their group decision (i.e., collective metacognition). Regarding team motivational processes, group cohesion and collective efficacy are two representative engines to keep team members committed in teamwork. Group cohesion refers to the degree to which team members feel attracted to the group and hold a team unity against disturbing influences. Collective efficacy represents the members' beliefs and confidence in their team's capabilities. Team affective processes concern the emotional climate of the group that manages individual and group emotions, handles conflict, and creates a positive, psychologically safe atmosphere. Lastly, team coordination processes require team members to constantly

exchange knowledge and information of each other's resources and environmental conditions, clarify individuals' specific contribution or roles and the timing and pacing of task activities, and monitor team progress.

## Contingencies in Team Leadership and Challenges

Team leadership does not happen in a vacuum but rather operates in complex and dynamic environments and conditions. A number of team, organizational, and environmental characteristics affect the team's needs and challenge the effectiveness of leadership processes.

When it comes to the team characteristics, for example, team composition and work design may create distinct team needs and leadership functions. Team members not only have different sets of skills, abilities, and work experience but also possibly have various educational backgrounds, ethnicities, and ages. Such diversity brings in individuals' unique expectations and values to the team from the decision-making process, work ethics, perception on authority, and communication style, which are potentially threatening factors that cause conflicts among team members and hamper team cohesion. Furthermore, if team members are geographically dispersed and in different time zones (e.g., global virtual teams), this generates greater challenges for leaders to perform critical leadership functions, such as establishing a shared sense-making or understanding in the team and monitoring the team performance.

The organizational culture and structure within which a team operates can also bring some challenges to the team. For example, in organizations where a top-down hierarchical structure is dominant, team members are not likely to be involved in the decision-making processes, and diversity is not welcomed; thus, it might yield negative influences on motivation and accountability of each team member to pursue organizational goals. Moreover, when there is an organizational culture that spreads the silo mentality and that values and rewards individual-level efforts rather than team performance, team members are likely to avoid spending their energy and time on teamwork or exchanging information with each other. Organizations also need to strive to supply sufficient team resources and provide training and development for both the team leader and members in effective team functioning.

Additionally, different leadership sources are likely to perform the different leadership functions. For example, an external leader, who is not a member of the team and is outside the team's daily activities, is in a better position to manage a team's boundaries, whereas an internal leader who is a member of the team has better opportunities to observe the team members' day-to-day behaviors, provide feedback, and make interventions at the most appropriate time.

Changes in a larger environmental context, such as the economy, market conditions, and competitors can have a substantial impact on the entire organization including teams. Increasing team flexibility and adaptability has been greatly emphasized (Morgeson et al. 2010a); thus, the team leader is required to develop norms and procedures that prepare the team to respond proactively and reactively to the ever-changing environments.

## Recommendations for Effective Team Leadership

Team leadership could be learned through organizational interventions since team leadership is not an individual role but a collaborative shared mental model that influences the team's work process. Small group facilitators could be brought in to model effective group process behaviors and help members develop skills in this area (Kolb 2011).

A shared mental model is one of the most basic components of team leadership, and this could be developed using cross-training (Salas et al. 2008), which focuses on understanding the team members' roles, tasks, concerns, and responsibilities. During cross-training activities, team members could develop a mental model as one team based on a shared vision and common performance direction. Based on the developed shared team

mental model, team building could be one of the most effective interventions for team leadership. During this process, training could focus on developing a common goal-setting practice, shared vision, role clarification strategy, and collaborative problem-solving approaches.

Once team building has been developed along with a shared team mental model, practical interventions could be applied such as scenario-based team training (Barnett and Weidenfeller 2016). During this activity, team members would learn realistic case-based problem-solving practices that would include following specific steps for solving given issues including scenario generation, data collection, evaluation practice, and feedback. In this training period, all members could collaboratively achieve strategic solutions for possible realistic problems based on the developed shared team mental model and supportive team spirit.

### Organizational Support for Effective Leadership Functions

As has been mentioned, team leadership is an influence process by which team members achieve collaborative team performance. The primary criterion for effective team performance is the members' engagement, and team leadership will play a key role in improving members' work engagement. In order to support this behavioral work engagement, the organization needs to focus on the following: the level of team assignment, the recognition of team achievement, the members' professional development, and reduction of factors that hinder their effective and collaborative team process (Anantatmula 2010).

In addition, at the organizational level, the following matters need to be addressed: communication barriers, risk-taking tolerance, conflict management, technology-related challenges, and organizational fairness (Morgeson et al. 2010a). Members of a team need to have shared vision and performance direction, and the organization should minimize any hindering factors and maximize supportive components. Support at both the behavioral level and organizational level will lead to more effective team leadership, the co-leadership of all members of the team.

## Conclusion

Lencioni (2011) mentioned in his book that what gives the ultimate competitive advantage to organizations is not finance, strategy, or technology but team work, both because it is so powerful and so scarce. Team work is not natural, and effective team leadership makes team work successful. Due to the importance and scarcity of successful team work, team leadership has received a great deal of attention and is one of the fastest-growing fields in the relevant literature (Swan 2016). Team leaders should put efforts into converging knowledge and skills every and each member possesses, creating harmonious and positive work environments, and building a sense of engagement and commitment among team members to pursue common goals. This chapter has provided an overview of team leadership that may allow current and future team leaders to understand team needs, influential processes, contextual challenges, and possible organizational support that therefore may help them become better facilitators.

# Technical Advantages of Bureaucracy

Mokgata Matjie
Industrial and Organizational Psychology Department, University of South Africa (Unisa), Pretoria, South Africa

## Synonyms

Body of officials; Bureaucratic; Bureaucratization; Bureaucrats; Civil service; Government; Max Weber theory; Office administration

## Definitions

*Bureaucracy*: is an organizational structure that is characterized by many rules, standardized processes, procedures, and requirements.

*Technical advantage*: refers to an incremental improvement in the known methods of production, such as the methodological and procedural methods of bureaucracy which are likely to result in greater chance of success.

## Introduction

Bureaucracy is a popular and complex governance system, which has been criticized and praised at the same time by scholars. For example, Weber argued for and against bureaucracy when he called it "a useful technique for ensuring that decisions are made on the basis of knowledge" and an "iron cage of reason" where rules rather than reasons are important (Weber 1958). Bureaucracy is the most efficient way to set up an organization, administration, and organizations. Max Weber believed it was better than traditional structures because in a bureaucracy, everyone is treated equal and the division of labor is clearly described for each employee.

Bureaucracy have been widely used worldwide with invidious meanings directed at governments and businesses since its inception. However, it appears that bureaucracy has an important role in shaping both public and private organizational performance. This perception stems from bureaucracy's technical superiority to all other forms of governance in terms of administration, coordination, and control (Weber 1958). Bureaucracy has also been popularly associated with "slow and inefficient, resistant to change, impersonal and unresponsive" by scholars due to layers of authority and red tape. Despite such criticism, some government or private institutions are effective and efficient at meeting their objectives amidst bureaucratic governance system (DiMaggio and Powell 1983).

The aim of this chapter is to highlight the technical advantages of bureaucracy enjoyed by organizations, which adopts bureaucratic governance system.

## What Is Bureaucracy?

The term "bureau" signifies a writing table, which means a place where officials work. The term

"cracy" is derived from Greek word meaning "rule." Concisely, bureaucracy means rule by the book. It is a social theory, conceived by Max Weber during the nineteenth century (1958). Weber argued that bureaucracy is the most efficient way to set up an organization, administration, and organizations, and based on the following three principles, (a) all regular activities within a bureaucracy can be regarded as official duties; (b) management has the authority to impose rules; and (c) rules can easily be respected based on established methods.

Bureaucracy is an administrative system designed to accomplish large-scale administrative tasks by systematically coordinating the work of many individuals. The concept dates back to seventeenth century as an illness causing havoc whereby public officials appointed where not serving the public interests, but it seemed as public interests were established so that public officials can exist. To curb this illness, Machiavelli proposed appointment of diligent, faithful, and competent public officials (who will follow rules strictly) who are also rewarded accordingly. The concept bureaucracy with its popularity is constituted as another type of government based on Greek classification of governments, namely, monarchy, aristocracy, and democracy (Albrow 1984).

Weber (1978) observed three types of power in organizations: traditional, charismatic, and rational-legal or bureaucratic authority. In traditional authority, people such as Chiefs and Lords, among others, are obeyed because of their traditional power. In charismatic authorities, people are followed because of their exceptional personalities, which command direct obedience from their followers as in case of Christ, Muhammed, and Napoleon. Weber, however, has emphasized that bureaucratic type of power is the ideal one. In a rational-legal bureaucracy, everyone is treated equal, and the division of labor is clearly described for each employee. This notion was widely supported by prominent scholars (Katz and Kahn 1978; Urdy 1959).

Bureaucracy is the basis for the systematic formation of any organization and is designed to ensure efficiency and economic effectiveness. It is an ideal model for management and its administration to bring an organization's power structure into focus. In an attempt to bring the power into focus, bureaucratic organizations have the following characteristic (Albrow 1984):

1. The staff members are personally free, observing only impersonal duties of their office. In addition, relations between superiors and subordinates are impersonal; thus superiors are formal in dealings with their subordinates.
2. There are clear hierarchy of office, characterized by downward delegation of authority. Each superior exercises control over his subordinates.
3. The rules and regulations pertaining regarding work behavior, rights, and duties of employee are laid down to ensure the consistency in work performance.
4. Selection and appointment of employees are based on the technical competence and professional qualification of employees, with training that is also provided to familiarize the employees with the rules and administrative procedures of the organization.
5. There is division of work on basis of specialization of jobs in bureaucratic organizations. Each employee performs his specialized work in a predictable manner. For example, in hospital, specific parts of patient care (the job) are assigned to different individuals or groups: nurses, dieticians, laboratory workers, and doctors all provide a part of care which the patient needs.
6. The official's post of his/her sole or major occupation thus may appropriate neither the post nor the resources that go with it. The official is subject to a unified control and disciplinary system.
7. There is a career structure with promotion possible based on merit or seniority and according to judgement of superiors, thus no room for favoritism.
8. There is predictability; thus the rules, regulations, specialization, structure, and training import predictability and thereby ensure stability in the organization.

9. There is conformity. Conformity to rules and roles in the structural framework bring about order to cope with complexity.
10. It enhances rationality prescribing in advance the criteria for decision-making in routine situations.
11. There is democracy: emphasis on qualifications and technical competence make the organization more democratic. Officials are guided by the prescribed rules, policies, and practices rather than by patronage or other privileged treatments.

The term bureaucracy has a negative connotation and is often linked to government agencies and large organizations. Nevertheless, the great benefit of a bureaucracy is the large organizations (private and public) with many hierarchical layers, because through bureaucracy, they can be structured for efficiency and their work coordinated effectively.

## Technical Advantages of Bureaucracy

As mentioned earlier, bureaucracy leads to slow and inefficient, rigid, resistant to change and innovation, impersonal and unresponsive, hampered by layers of authority, permeated with red tape, and subject to considerable goal displacement. Most of these challenges are compounded in public organizations given their political and institutional nature.

Bureaucratic system is not only used in public organizations but also in any larger and complex organizations that need secure coordination, cooperation, and control of all employees and to reduce conflict among vast employees considering the higher-level hierarchy. It is common understanding among scholars that high level of hierarchy may distort flow of information and communication within the organizations; thus decisions and actions delayed resulting in rigidity. In public organizations, politicians might also add to increased hierarchy levels because they also need to coordinate and control of their public agencies, thus reported to. For decades, an impasse existed between scholars who celebrated bureaucracy and its technical advantages and those scholars who criticized bureaucracy.

The following are the *technical advantages of bureaucracy* as identified by Weber and other scholars:

- Bureaucracy makes it easier for management to maintain control and make adjustments when necessary.
- Bureaucracy is especially inevitable in organizations where legislation plays an important role in delivering a consistent output.
- Weber argued that it is the "iron cage" that affords a level of efficiency that modern society cannot do without.
- The established rules and procedures allow for high efficiency and consistency in execution of work by all employees.
- Principles of bureaucracy facilitate management of large-scale and complex organizations through centralized policy setting and decentralized decision-making, thus leading to organizational competence.
- General rules and welfare services create trust in institutions of government and among citizens, when implemented in an impartial and incorrupt way (Weber 1958).

*Bureaucracy also*:

1. Protects employees from unfair rulings from leaders, which gives a greater sense of security to the employees.
2. Creates an opportunity for employees to become specialists or experts within one specific area, increasing the performance (effectiveness and efficiency) in each area of the organization.
3. Creativity and stability are promoted within their respective duties and sub-tasks.
4. Leads to consistency in employee's behavior through clearly defined duties and responsibilities and eventually the management process becomes easy.
5. Utilizes merit and expertise for selection and promotion procedures. Thus right people on

the right jobs and ultimately optimum utilization of human resources.

6. Bureaucracy benefits not only for operational performance and technical reliability of the organization but also the welfare of employees, clients, and broader public.
7. Bureaucracy can also be positively related to important economic, social, and political criteria. For example, merit-based bureaucracy fosters economic growth in developing countries and contributes to poverty reduction.
8. Bureaucracy is associated with low corruption, partly because a longer time horizon makes quick returns in terms of corruption less likely.
9. Bureaucratic rules, furthermore, contribute to democratic equality because they are (relatively) blind to the wealth and other resources of the citizens they serve.

## Conclusion

The German sociologist Max Weber argued that bureaucracy constitutes the most efficient and rational way in which organizations can organize the human activity and that systematic processes and organized hierarchies are necessary to maintain order, maximize efficiency, and eliminate favoritism. It has a series of characteristics such as precision, continuity, discipline, strictness, and reliability, which makes it technically the most satisfactory form of organization or government for both public and private sectors. Bureaucratization is an inevitable process because every organization (such as churches, governments, charity bodies, corporates, big or small businesses, voluntary organizations, interest groups) needs a set of rules and regulations, which will guide it, daily routines and strategic objectives.

Despite it being associated with rigidity, impersonality, and ineffectiveness, bureaucracy is still relevant today and its importance bound to increase; as such, it should not be neglected.

Bureaucratic leadership lends itself to structure, rules, and policies that should be strictly adhered to. However, to be effective, this leadership style should be used when an organization is staffed with by people who are comfortable knowing what to expect and what is expected of them and on organizations that depend on consistent results, as compared to those valuing autonomy, flexibility, creativity, innovation, and independence.

Bureaucracy might demotivate employees when they are unable to voice their opinion or influence decision-making. It might also lead to creative and entrepreneurial employees being rebellious due to the rigid rules and requirements. As a result, it is very important that bureaucratic organizations (such as financial institutions, government departments, etc.) properly inform employees well in advance about their approach to work and require them to accept this. Only employees who agree to this approach are suitable to work within a bureaucratic organization.

Despite all these setbacks or criticism, bureaucracy is still prevalent today in both public and private sectors around the world. Moreover, scholars have suggested that public organizations and organizational hierarchies are generally more highly efficient and effective. As a result, scholars acknowledge the contributions of bureaucracy and its organizational hierarchies on the successes within the public and the private organizations.

Still, critics might consider bureaucratic governance system structures as ineffective. However, notable is that there are countries, governments, and private organizations which operate effectively and efficiently using bureaucratic governance system. Nevertheless, the fact remains bureaucracy exists and is here to stay.

# Technological Justice and Job Satisfaction: Structural Equation Modeling

Samir M. Hammami[1] and Osama Hazzi[2]
[1]Department of Management Information Systems, Dhofar University, Salalah, Oman
[2]FrontiersToday, Vienna, Austria

## Synonyms

Job satisfaction; Structural equation modeling; Technological justice

## Definition

Technological justice (henceforth, TechJ), as the reference work entry in hand defines, is the one's perceptions about the fairness of using technological tools intended for work purposes and its sustainability. Concerning the latter, it expresses the ability of one to maintain at a certain level of using those tools (the ability to keep up with the changes).

## Introduction

Literature is rich with research on organizational justice and job satisfaction (henceforth, OJ and JS, respectively) and includes research that has studied the relationship between these variables in diverse cultures (e.g., Li and Cropanzano 2009; Vaamonde et al. 2018) and shown the extent to which OJ could influence JS at those working in educational institutions (e.g., Karakose 2014). Both variables are a significant concern for the organization-employee relation. Injustice can damage this synergistic relationship.

Nevertheless, the literature has not answered the question if TechJ, a new justice measure Hazzi and Hammami (2019) have coined, could influence JS. The current entry is an attempt to answer this question. The answer could open the door for new thinking on this justice from diverse cultures.

## Methodology

The current entry has applied the research at the academic staff (272 participants) working at 4 private universities found in 4 governorates in Oman to research how staff perceptions about the fairness of using technological tools intended for work purposes and their ability to maintain at a certain level of using those tools influence the JS (abridged Job In General scale, aJiG). The use of technology in education makes it critical that academic staff and authority figures concern about equitably allocating the teaching tools (including the technology-influenced teaching tools) and developing teaching skills to perceive justice and have a satisfactory teaching process.

Concerning the target sample, it is sufficiently large (>200), and the central limit theorem ensures that the distribution of the disturbance term is at approximate normality (Statistics Solutions 2013). The sample does not include the missing data. Table 1 shows a diverse sample.

The entry has used SPSS21/AMOS24 and applied partial least squares structural equation modeling (PLS-SEM) to test the intended hypothesis (i.e., TechJ influences JS). The entry included the factor loadings with values ≥0.5. Concerning

**Technological Justice and Job Satisfaction: Structural Equation Modeling, Table 1** Sample characteristics

| Variable | Choice | Frequency | % |
|---|---|---|---|
| **Nationality** | Omani | 45 | 16.5 |
| | Non-Omani | 227 | 83.5 |
| | | **272** | **100** |
| **Gender** | Male | 172 | 63.2% |
| | Female | 100 | 26.8% |

| | ≥ 60 | 1 | 0.4 |
| | | **272** | **100** |

Note: the authors prepared this table

the latter value, the available data drove the entry to use it to have satisfactory findings.

## Conclusion

Tables 2 and 3 show the reliability and model's goodness of fit (GOF). Table 3 could work as basic GOF statistics for the measurement model.

The data also fulfill the construct validity. Factor loadings (≥ 0.5) and reliability (≥ 0.7) are a good rule of thumb and reliability, which indicate the convergent validity (Hair et al. 2014).

Figure 1 shows that the intended hypothesis is supported and that TechJ significantly influences JS (standardized B = 0.77 with an observed *p*-value <0.001 estimated); however, the entry had to delete the items with factor loadings <0.5, and this included items 1 and 5 from TechJ and 2, 6, and 8 from JS (Appendixes: Tables 4 and 5).

**Technological Justice and Job Satisfaction: Structural Equation Modeling, Table 2** Standardized factor loadings and Cronbach's alpha

# Technology and Nonprofit Organizations

John G. McNutt
University of Delaware, Newark, DE, USA

## Synonyms

ICT of nonprofits; NGO technology; Nonprofit informatics

## Definition

Nonprofit technology refers to the application of information and communications technology (ICT) tools to the operation of nonprofit organizations.

## Nonprofits in a Digital Age

The overwhelming majority of organizations, including nonprofit organizations, make some use of technology tools. These tools provide the capacity to advance nonprofit organizational missions and create the ability to explore new areas of operation. While the possibilities offered by nonprofit technology are vast, many believe that the sector has lagged behind its counterparts in the public and commercial sectors in the adoption and use of these tools. Making generalizations about a large and varied group of organizations is difficult, and there are many signs that suggest that progress has been made.

The entry will review the current state of nonprofit technology, taking into account its historical development, range of current technologies, and future prospects. Each will be considered in turn.

The nonprofit sector is incredibly diverse. Even within the incorporated nonprofit community, there is considerable variation in size, funding, and mission. When you add to that the unincorporated voluntary associations, the amount of variation is noteworthy.

Organizations that differ in size, mission, and resources are also likely to vary in the types of technology used. Nonprofit hospitals, for example, are likely to have extensive technology arrangements that reflect the expectations of the health-care sector and maybe equal to what for profit hospitals employ. On balance, smaller organizations and voluntary associations may have a hard time marshaling the most basic technology. This might be reflective of the variation in other parts of the sector.

## Historical Development

Information and communication technology was principally the province of larger nonprofits (hospitals, universities, very large service agencies) until smaller computers developed. Early computers were very large and expensive and needed a large professional staff to maintain them. They are called mainframe or legacy technology today. Most of the original development of the technology happened in North America and Europe, but this changed as time went forward. Much of the technology had primarily military and industrial applications with some limited usefulness for public and nonprofit organizations.

The advent of smaller computers began in the 1970s and 1980s. Minicomputers (such as the Digital Equipment Corporation's Vax) brought computers to medium-size service agencies. These computers (including developments in Western Europe and Japan) offered a sea change in what was possible in nonprofit technology. Useful as they were, these computers were too large and too expensive for many nonprofit organizations. They did add to the international movement toward E-Government which affected nonprofit organizations indirectly. Both the United Nations and the International Bank for Reconstruction and Development (the World Bank) had major efforts in the area of e-government.

The development of personal computers or microcomputers meant that even small organizations could have technology. Many organizations

built their earliest technology on small but underpowered computers with limited software choices. As time went on, they became more powerful and more portable. This was a worldwide revolution that, combined with the growth of networking, changed many of the parameters of what was possible for nonprofits.

Computer networking was available before the Internet became available, but it was limited to a number of small networks. Connection speeds were limited but it represented a capacity that was unparalleled in the past. Community computer networks (also called Freenets) sprang up all over the USA and throughout the world to offer access to citizens and local actors (Schuler 1996; Bryan et al. 2002). Some of these networks were operated by the government but a significant portion was run by nonprofits. Both e-mail and discussion list software were developed before the Internet was widely available.

The Internet was a major development in the use of technology. A network of networks, the Internet was created by the Department of Defense's DARPA (Defense Advanced Research Projects Agency) as a way to connect mainframe computers (Hafner and Lyon 1996). While access was restricted in the beginning, eventually nonprofit had access. A limited number of non-university nonprofits had access to the Internet. This was a largely text-based environment with limited search and indexing capacity.

The limited reach of the Internet changed with the introduction of the World Wide Web and the growing commercialization of the Internet. The growth of technology in nonprofits was noteworthy (Burt and Taylor 2000, 2003; Princeton Survey Research Associates 2001). In very little time, even small nonprofits had websites. E-mail and discussion lists became ubiquitous. Much of the activity reflected the offline marketing that these organizations were doing (often referred to as brochure ware) without any appreciation of what technology could do. This period is often called Web 1.0 by technologists. Where technology really did help nonprofits was in the growing sophistication of databases and financial management technology. While most of these applications were designed for small businesses, nonprofit-specific technologies were beginning to emerge.

The growth of nonprofit technology coincided with the beginning of e-government and a number of fundamental changes in the nonprofit sector (such as privatization and contracting). This was a period in which small- and medium-size nonprofits struggled to use technology. A large-scale survey of US nonprofits conducted in 2001 by Princeton Survey Research Associates documented the limitation of nonprofit technology. A series of studies conducted in Pennsylvania documented progress in nonprofit technology growth (Finn et al. 2006). Burt and Taylor (2000, 2003) examined similar phenomena in Great Britain.

At this stage, consultants and other outside groups provide a lot of the technology support for the nonprofit sector. Circuit Riders, technology workers who helped nonprofits develop their technology, provided a sector-wide force for change (McInerney 2007). Another resource was nonprofit technology assistance providers (NTAP), local groups that provided technology assistance. The Nonprofit Technology Enterprise Network (NTEN) was founded in 2000. Funding from a variety of sources including NTIA's Technology Opportunity Program, the Rockefeller Foundation, the Mott Foundation, and the W. Alton Jones Foundation accelerated technology growth in the nonprofit sector. Groups like N-Power and TechSoup emerged. Community technology centers (CTCs) assisted a wide range of users, including nonprofits, develop the skills and access to close the digital divide (Miller 2013). The growth of e-development within the international NGO community brought technology to people in the poorest parts of the world (Quinones et al. 2015).

The next generation of technology was waiting in the wings. The development of blogs, wikis, social networking sites, podcasting, video and image sharing, microblogging, and a variety of other technologies changed the dynamic in technology. These technologies added to the interactivity of earlier technology, the Internet as

platform, user-created content, the sharing of collective intelligence, and the ability to combine applications in new and innovative ways (see O'Reilly 2005; Kanter and Fine 2010). Referred to as Web 2.0, social media, or social software, these technologies were quickly adopted by many organizations and a large number of individual users worldwide. Technology changed how people could interact with the Internet and what expectations people had for their online experience. The development of these technologies had a major impact on nonprofit advocacy (Guo and Saxton 2014), fundraising, and marketing (Dumont 2013). Facebook and Twitter are clearly the most well-known of these technologies. The emergence of Web 2.0 coincided with the development of hardware that became more portable, more capable, and to an extent more affordable. The ability of expanded wired and wireless communications has expanded substantial over the last two decades. Wireless applications and cell phones allowed many nations with underdeveloped technology infrastructures to evolve quickly to the information age.

In the past decade, we have seen progress to achieve parity in technology. Progress has been documented in study after study (McNutt and Barlow 2012; Geller et al. 2010; Hamann and Bezboruah 2013). The level of technology is, of course, a moving target. What is great technology today can be inadequate technology 3 years down the road. There is, again, substantial variation in the sector.

A number of trends are conspiring to write the next chapter in nonprofit technology. Certainly, the technology will improve and develop new capacity. Web 3.0, the semantic web, will revolutionize how we use technology. Massive amounts of available data and the development of predictive analytics will affect strategy and other aspects of nonprofit operations. The Internet of Things is already having an impact on nonprofit health care and is likely to quickly diffuse to a range of settings. The sharing economy will bring other aspects of technology into the sector. Civic technology could redefine the role of nonprofits vis-a-vis government technology. All of these forces will change the tools that nonprofits use but will also change how organizations are structured.

## How Nonprofits Use Technology

Technology varies from organization to organization. In general, it seems fair to say that sophistication in technology in most organization is probably consistent with what similar organizations are putting in the field. Probably the most important technology for most nonprofits is the database. Databases allow nonprofit organizations to manage information about employees, clients, donors, and a variety of other things. Databases are a critical part of enterprise management systems, management information systems, and constituent relationship systems. Larger organizations will have data warehouses and data marts. With the advent of data science and the collection of ever larger collections of data, the development of data centers and cloud-oriented data systems has emerged.

Related to databases is the emergence of efforts to create nonprofit dashboard. A dashboard gives a decision maker access to that data that he or she requires to make the best decisions. Some are very simple, while others allow a great amount of functionality. They provide data visualization capacity so that managers can appreciate the overall picture.

One of the areas that dashboards track is financial status and financial information. There are a range of software programs that support the financial management function. This includes spreadsheet programs, accounting programs, billing and credit card programs, and other more specific dedicated financial programs. Because of purchase of service contracting, financial systems might have supported governmental accounting approaches as well, and social enterprise efforts might need support or for profit accounting.

Data security and malware prevention are critical parts of any organization's management (see Hoy and Phelps 2009; Imboden et al. 2013). Federal and state laws such as the Health Insurance Portability and Accountability Act and the Family

Educational Rights and Privacy Act require some data to be securely protected. The consequences of data breaches can be extremely high and they are becoming more commonplace. Malware (viruses, ransomware, Trojan horse programs, and so forth) threatens the integrity of a nonprofit information system and makes it imperative for organizations to take security seriously. Larger nonprofit organizations are beginning to use the National Institute of Standards and Technology Security Framework as a guide to developing their own policies and practices.

Fundraising is central to most nonprofits and requires a great deal of information management capacity. In general, there are two general classes of technology tools. The first group supports traditional fundraising (planned giving, major gifts, special events, and so forth), while the second group raises money directly through technology.

Technology can automate prospect research, grant research, and donor development. It can also assist in managing the workflow that is generated by these processes. Other technology can support the creation of special events and face--to-face fundraising. While some of the technology is off the shelf applications, a substantial portion is designed specifically for nonprofit organizations and for these specific processes. These are often coupled with databases with information on potential prospects and grant opportunities.

The other group of technologies is designed to directly raise funds over the Internet. E-mail and website fundraising is an early form of technology-based fundraising which is still employed by most nonprofits that raise money online. In recent years this has been substantially augmented by social media/Web 2.0 efforts. Most of the major social networking sites allow for donations and promote fundraising. In addition, third party platforms have greatly enhanced the ability of charity malls to bring groups of nonprofits together. Click to give efforts create fundraising relationships with online retailers. Crowdfunding systems have developed substantially in the past few years (Stiver et al. 2015).

Text to give has emerged as a major online fundraising modality in the wake of its use in the Haiti Earthquake. Given the growth of mobile technology, it is clear that we have not seen the final potential of the technique.

Charity accountability efforts such as Guidestar (www.guidestar.org) and Charity Navigator (http://www.charitynavigator.org/) are sites that offer potential donors the ability to review information about nonprofits before they donate. They provide information on financial performance, mission, programs, funding, and so forth.

Technology has been an important addition to the marketing capacity of nonprofits. The amount of information available on the Internet complements the marketing research conducted by nonprofit organizations. Online databases combined with data from analytics and search results (e.g., Google Trends) make research accessible to even smaller nonprofits with limited data collection ability.

The range of technology-based marketing tools that are available is truly impressive. Websites and e-mail are probably the earliest online marketing techniques. Websites have evolved from a static website to highly sophisticated database-based sites using content management systems. E-mail has evolved as one tool of Constituent Relationship Management systems, and smart systems can efficiently narrowcast messages to a varied population of constituents.

The emergence of Web 2.0/social media has added a substantial capacity to the online nonprofit marketer's arsenal. Blogs, social networking sites, image and video sharing sites, wikis, and podcasts are just some of the possibilities for delivering information and creating online communities. In addition to the use of these sites, advertising can add to the reach of the organization. Typically, these advertisements can be targeted at likely populations. Analytics makes the evaluation of effectiveness more sophisticated. The incorporation of mobile technology into the area has greatly expanded the possibilities.

Volunteers are important to many nonprofit organizations. Technology assists in the

management and recruiting of volunteers. Online third party sites, such as volunteer match, can potentially open up new vistas for nonprofits. An exciting development is the role of technology in recruiting and managing short-term episodic volunteers. The technology has been used in disaster management, citizen science, and related areas. The growth of virtual volunteers over the past two decades has created a major new source of volunteer talent for the sector.

Advocacy is a process near and dear to the sector and one in which technology has made a significant difference. It is safe to say that over the past three decades, technology has revolutionized the practice of issue advocacy. Websites, e-mail, social networking, microblogging (such as Twitter), video and image sharing, and a host of related technologies have allowed nonprofits to research issues, educate and mobilize the public, and apply pressure to decision makers. In addition to incorporating technology developed for other uses, advocates have employed applications that were specifically designed to support advocacy efforts. In addition, technology developed for partisan political efforts have gravitated to use in nonprofit advocacy.

The data science revolution may be the next development in nonprofit advocacy. The application of large mass data to social problems, identify potential supporters and evaluate impact, is an exciting possibility. Coupled with data visualization approaches and sophisticated mapping tools, the technology can support much more precise campaigns.

Technology not only changes day-to-day work, it changes the way organizations function and how they are designed. Organizations with technology are different from those without and certain types of technology can change organizations radically. Technology changes the nature of work and work arrangement, alters structure, and creates a series of new possibilities. It also allows for the development virtual nonprofit organizations and virtual voluntary associations. These developments can create major change in the population of nonprofit organizations.

## Conclusions

Nonprofit technology has emerged from an uncertain past to a major asset of the nonprofit sector. Which parts of nonprofit technology are most important? At the very least, databases and financial management software have brought substantial change to how the core operations of most nonprofits pursue their missions. Nearly every nonprofit organization from the smallest association to the largest foundation depends on their capacity to manage information.

There are three major forces driving the evolution of nonprofit technology: the development of technology and its adoption in the general population, the changing environment of the nonprofit sector, and the efforts of nonprofit organizations to apply the capacity of technology to their organizations. These three forces help explain what has happened in the past and will help us understand what might happen in the future. As technology moves to the next phase, we can expect difficult choices and exciting possibilities.

# Temporary Organizations

Elke Schüßler
Johannes Kepler University, Linz, Austria

## Synonyms

Temporary systems

## Definition

Temporary organizations form for the purpose of accomplishing an ex ante-determined task with a predetermined termination point. They can be intraorganizational, occurring within the context of a non-temporary organization, or interorganizational, comprising a number of organizations (cf. Kenis et al. 2009, p. 2).

## Introduction

Temporary organizations or systems are a prevalent and relevant organizational form, with projects being the most well-known exemplar. Some even speak of "project society" to highlight a broader societal shift from industrial society, marked by traditional organizations and work arrangements, toward a projectification, marked by temporary and often highly networked work arrangements (Lundin et al. 2015). These developments raise broad questions not only for the organization of work and management but also for institutions such as corporate and labor law. Critical perspectives problematize the implications of projectification for issues such as the work-life balance, gender equality, workplace democracy, or identity and control.

Temporary organizations differ from traditional organizational settings with regard to four key characteristics: tasks, teams, transitions, and time (Lundin and Söderholm 1995). The most important criterion is *time*, as temporary organizations – unlike conventional, non-temporary settings – have a built-intermination mechanism.

This does not mean that temporary organizations only exist for a short duration, however. In fact, many temporary organizations – such as mega-projects – outlive conventional organizations, and permanent organizations do not exist forever. The difference between the two forms lies in the ex ante definition of a predetermined duration for temporary organizations (Bakker et al. 2016). Temporary organizations typically depend on a limited number of clearly defined *tasks* and objectives. These objectives are of a nonroutine nature, unlike those of permanent organizational settings. A *team* is usually formed around the respective task in a customized fashion, and a purposeful *transition*, i.e., some form of transformation or change, is perceived to be the necessary outcome.

The main advantages of temporary organizations are their flexibility and adaptability to changing market demands. In this sense they are considered as a complement to permanent organizations that are usually to be valued for their permanence and stability. Very often, temporary organizations, such as projects, are formed in the context of permanent organizational settings and are embedded in structures such as networks, regional clusters, or organizational fields. The boundaries between temporary and non-temporary organizations are therefore quite fuzzy.

The ephemeral nature of temporary organizations has spurred intense research efforts in the field of organization and management studies, tackling, for instance, issues of knowledge management at the interface of temporary and permanent organizational settings, questions of human resource management and interpersonal trust, and questions regarding the unfolding of temporary organizations over time. This research spans a wide range of empirical settings such as theater productions, film making, big events, or construction efforts. In attempting a synthesis of this research, Bakker et al. (2016) outline three approaches toward studying temporary organizations: temporary organizing as form, temporary organizing as perspective, or temporary organizing as process. This distinction serves as a structuring device for discussing temporary organizations.

## Temporary Organizations as Forms: Different Types and Classifications

Given their fuzzy nature and boundaries, temporary organizations come in many different forms and with different characteristics. Bakker et al. (2016) distinguish three forms of temporary organizations based on whether the temporariness stems more from structures and organizing practices or more from actors and staffing practices. The first form they derive is called *temporary, ephemeral, or disposable organizations*, which best fit the criteria of temporary organizations outlined above in that both structures and actors are temporary. Such temporary organizations can form in the face of a disaster, for instance, or for the completion of a creative project such as a film production. Temporary organizations in this narrow sense are disbanded once the given task is completed. Such forms of temporary organizations are often interorganizational in nature, comprising members from different organizational backgrounds to collaborate for a limited period of time.

The second form is called *semi-temporary organizations*, referring to temporary systems that exist in the context of more permanent organizational structures. Here, the actors involved are more or less permanent, but the organizational structures that are created are temporary. One example is *project-based organizations* (*PBOs*), i.e., permanent organizations whose operations are almost entirely carried out in the form of projects. PBOs are found in a variety of industries, ranging from consulting and professional services to cultural production and construction. Another example of semi-temporary organizations is *project-supported organizations* (*PSOs*), typically innovation-oriented organizations that need projects for their research, development, and marketization activities. A third example is *project networks*, which are defined by the latent permanency of relationships among actors from different organizations that collaborate repeatedly over time. The defining feature of project networks – compared to interorganizational projects – is the embeddedness of such projects in more permanent contexts such as networks, regional clusters,

or organizational fields. Project networks might overlap with PBOs or PSOs in that such organizations can, of course, participate in project networks.

The third form is called *semi-permanent organizations with temporary employment*. Here the actors are temporary, but the organizational structures are more or less permanent. For instance, temporary work agencies are permanent organizations that temporarily draw on different contractors or employees that are then hired by customers, again often temporarily. One of the main aims behind such arrangements is to establish a more flexible workforce to react quickly to changing market demands.

Similar dynamics can be seen when looking at temporary organizations inside of hierarchical organizations. Here, projects potentially allow spaces for experimentation and innovation, because project teams are removed from their routine activities. Yet, it is precisely at the boundaries between temporary and permanent organizations where tensions for management and organization occur. For instance, project members typically remain embedded in their functional roles and departments and thus face conflicting performance targets. Additionally, there is often organization internal competition around being staffed on ambitious and interesting projects, which might threaten collaboration within functional or divisional departments.

## Temporary Organizing as Perspective: Unique Features of Temporary Organizations

Temporary organizations, by their nature, challenge some of the core principles of organizing such as coherence, long-term planning, and stable relationships. However, acknowledging that most temporary organizations are embedded in more permanent contexts, they are, albeit sometimes latently, surrounded by stable structures on which they draw. Grabher (2002) studied one such context in depth, the advertising industry in Soho (London, UK), and argued that the resulting organizing principle is best described as one of the heterarchy. He uses the term *project ecology* to denote multiple contextual layers of project organizing: a core team, an organization, an epistemic community, and personal networks that are temporally tied together for the completion of a specific project. Because collaboration is limited temporarily, actors maintain their differential identity and preserve a diverse spectrum of practices and organizational forms, thus avoiding forming a coherent and dominant view and becoming path dependent. The resulting rivalry, diversity, dissonance, and loose coupling between temporary organizations and contexts are considered as unique organizing principles related to temporary organizations.

## Temporary Organizing as a Process: Potentialities and Challenges

Temporary organizing as a process refers to practices that make use of temporariness to complete specific tasks or, more broadly, to get things done in or across organizations or even in wider organizational fields.

One example of such a form of temporary organization associated with getting things done on a field level are *field-configuring events*, defined as settings of limited duration where actors from different organizations with diverse purposes assemble temporarily in order to exchange information, announce new products, construct social networks, develop industry standards, recognize accomplishments, or transact business (Lampel and Meyer 2008). Common forms of field-configuring events are conferences, trade fairs, award ceremonies, or festivals – sites where members of an organizational field temporarily come together to negotiate or celebrate field-level structures and shape the further development of the field. The temporary nature of these settings is tied to particular interaction dynamics, such as the possibility for actors that do not normally cross paths to meet each other so that new relationships can be formed and new ideas can be developed.

In increasingly globally dispersed industries and organizational fields, the possibility for field actors to come together face to face temporarily is crucial for coordinating activities and building trustful relationships. Temporary organization in this sense provides opportunities that could not otherwise be provided through permanent organizations and provides a necessary complement to dispersed, often technologically mediated interactions. Such temporary interactions can take place in different spaces and places – organized ones such as trade fairs but also unorganized ones such as airports, train stations, or bars and cafes.

Likewise, projects as another form of temporary organization are associated with the capacity to catalyze action and change into a certain direction, for instance, through the setting of milestones and other practices of temporal pacing and structuring. A core managerial question in this regard is how linkages between different projects unfolding over time, either within or across organizations, can be established so that learning and knowledge sharing can take place. For this purpose, many organizations set up a *project management office* (PMO) that creates structures and practices for managing project portfolios, including standards for how projects are executed or databases for sharing information across projects.

A core challenge for interorganizational projects revolves around potentially colliding norms and institutions stemming from the various organizational backgrounds of members in the project team. Conversely, even interorganizational projects can be prone to path dependence, such as when project partners are selected merely on the basis of past collaboration experience. Such issues can be addressed through common practices of network management (Sydow et al. 2016), such as selecting partners who share similar norms and procedures or establishing common norms and informal practices of collaboration while at the same time systematically evaluating the performance and goal achievement of interorganizational projects.

Regarding the context of semi-permanent organizations with temporary employment, core challenges revolve around the management of work arrangements spanning across multiple employers. A pressing issue, for instance, is inequality of wages or working time regulations between core and peripheral employees that have to work together – at least temporarily – to complete certain tasks. Related to these inequalities are issues of culture, identity, and motivation that arise at the interface of multiple organizational boundaries.

## Conclusion

In sum, temporary organizations overlap with permanent organizational forms, but are associated with unique characteristics that also create unique challenges for management and organization. While a large literature on "project management" often stemming from an engineering tradition has provided functional advice for how to best manage a project – the most prevalent form of temporary organization – social science research has provided a more nuanced picture of the fuzzy nature of temporary organizations.

Core insights are that the term "temporary" is not to be equated with "short term," as many megaprojects such as those found in the construction industry last for years or even decades. Additionally, what is temporary and what is permanent in a given organizational setting often requires further specification and depends on one's perspective. The Olympic Games, for instance, are a temporary event from the perspective of a particular locality or for certain participants and visitors. At the same time, the Olympic Games take place annually and are coordinated by a permanent organization, the International Olympic Committee (IOC). One way of looking at the Olympic Games would be to study the event series as an annual interorganizational project comprising actors that have worked together in the past as well as annually changing local actors. Another way of looking at the Games would be to look at one particular event as a

temporary organization or a field-configuring event from the perspective of a given municipality. A third way would be to study the IOC as a permanent organization intersecting with different temporary organizations repeatedly over time.

Permanent status

## Definition

The duration and circumstances of employment in civil, judicial, academic, and similar public sectors. After a probationary period, this job security is granted in these professions as a means of protecting those services from political influence.

## Introduction

The first administrative reforms in early American history aimed to remake public agencies free from political influence. The Pendleton Act was passed in 1883 to meet this goal by crafting competitive examinations for public servants as well as protections from termination for political reasons and from forced cooperation in political activities. Professionalization of the administrative branch was advanced with the development of merit systems to ensure qualifications and skills decided which candidates were hired and promoted. Today's American culture places great importance on work and rewards influential jobs with higher salaries, impressive perks, power, and prestige. Public employees are often engaged in activities that improve the lives of everyday Americans without these aforementioned enticements – bonuses, promotions, and even raises depending on the political climate. Job security tends to be the holy grail of public work with those in several sectors from judges to post office employees to university professors earning tenure at varying rates. To those outside of the public sector, this guaranteed employment may look like entitlement. To those in business, the concept that you may be stuck with a bad employee indefinitely could seem totally unacceptable. To those in public service, it may be the only thing keeping them there. Tenure is not unique to US public administration – it is utilized internationally to prevent government corruption and encourage agency effectiveness.

## Tenure

The term tenure is defined as the duration and circumstances of employment in civil, judicial,

academic, and similar public sectors. After a probationary period, this job security is granted in these professions as a crucial means of protecting those services from political influence. A tenured employee may only be terminated if serious misconduct or incompetence is considered by an overseeing body like a disciplinary committee or a university board. Internationally, tenure is generally granted to retirement age which varies from 50 to 60 years. To understand the argument for the need for tenure in the United States, it is important to first understand the way its bureaucracy is organized. Noted public administration scholar Richard Stillman breaks down five subsystems within the bureaucracy. First, political appointees serve with no tenure and are often appointed based on political loyalties (Stillman 2010). This includes positions which range from the Secretary of State to the director of FEMA. The president generally appoints those from his own party but may utilize a member of the other party to encourage bipartisanship which President Obama did when he appointed Republican Ray LaHood as Secretary of Transportation in 2008.

Next, there are professional careerists who have special expertise with positions based on advanced professional training (Stillman 2010). These individuals are tenured and can be further categorized into five groups. Professional elites are a core set of experts that control personnel and the organization (Stillman 2010). Line professionals carry out the day-to-day functions of the agency (Stillman 2010). Staff professionals are specialists and technical assistants who have specialized proficiency to carry out assigned duties of the agencies (Stillman 2010). Administrative professionals consist of budget officials, program officers, planning personnel, and finance, purchasing, auditing, and supply officials (Stillman 2010). They solve organizational problems and think about the agency's future. There are also paraprofessionals that are paid less but serve many of the same functions.

Unionized workers are civil servants whose employment is based on negotiated contracts between union representatives and management (Stillman 2010). These exist at every level of government – federal, state, and local. The union types range from the National Education Association to the National Rural Letter Carriers Association and represent everyone from airline pilots to engineers and public school teachers.

Finally, there are contractual employees who are untenured workers whose employment within government is directed by contracts (Stillman 2010). This group can include everyone from retail workers in federal buildings to defense contractors like Lockheed Martin.

The service requirement for career tenure is laid out in CFR 315.201 (a) service requirement – a person employed in the competitive service for other than temporary term or indefinite employment is appointed as a career or indefinite employment is appointed as a career or career-conditional employee subject to the probationary period required by subpart H of this part. Except as provided in paragraph (c) of this section, an employee must serve 3 years of substantially continuous creditable service as defined in paragraph (b) of this section to become a career employee (US Government 2005).

Tenure is an extraordinary job security – permanent status. The protections of civil service employment after a 3-year probationary period are automatically applied. These individuals can no longer be fired without good cause like absenteeism or documented incompetence. Even after termination, the employee can receive in-person hearings. If that fails, he can file an appeal with the independent Merit Systems Protection Board which is an independent quasi-judicial agency (Merit Systems Protection Board 2016). Hearings and appeals are not limited to terminations, but the board may also oversee appeals on demotions, reprimands, and appraisals (Merit Systems Protection Board 2016). In the case of permanent judges, conviction and impeachment by the legislature is the only way to end tenure although they may choose to retire early.

## Benefits of Tenure in Public Administration

First and foremost, the professionalization of the administrative branch including tenure

requirements benefits the public by protecting their public service delivery from undue political influence. Second, it ensures there are knowledgeable people in these positions of power. General civil service workers who are tenured have hierarchies based on tasks and responsibilities. They operate under the merit concept which promotes employees based on one's ability to perform a job rather than political connections. It aims to be more representative of the people it serves. Performance is measured by written tests. An open job has to be offered to one of the top three scores on the exam with more points going to veterans, and there is an absolute veteran's preference at the state level. Once hired, they are given job protection after the probationary period ends. Tenure generally encourages recruiting talent that may be superior to those already on the staff because employees are not threatened by a new hire. This, in theory, reduces infighting and allows for greater cooperation in the workplace.

Hiring through this merit system produces high-quality candidates. Tenure is used to entice these candidates to take an often lower-paying job than available in the private sector; it also encourages these more talented employees to deepen their knowledge and loyalty to the agency. This also provides agencies legitimacy and power to advocate for their administrative programs which benefit the public. For example, a leader in the agencies on aging has expertise in the needs of older adults, the budget constraints on programming, and the community impact of those programs. This gives him the ability to advocate strongly for the agency and the constituents – which can help retain agency power, sometimes expand it, and most importantly serve the public well.

This design also allows for a safe space between civil servants carrying out day-to-day needs and political appointees. In this space, regular workers are guaranteed the right to challenge the direction of leadership. This allows all parties to better represent an extensive assortment of public interests by providing a contentious, pluralistic decision-making process. As these agencies possess a great deal of power, this internal system of tenured employee versus appointee allows for a measure of checks and balances in accordance with national ideology that aims to foremost prevent despotism.

## Issues and Solutions

Of course any system that has such lofty goals and encompasses such a large nation and so many workers has a vast array of issues. It is very difficult to fire a tenured public employee even with cause. It usually takes a merit board 3–5 years to hear a case and that case can then be appealed. This process can take 12–18 years, and then they are often handed off to another agency. Political appointees are temporary, budgets change annually, and career mobility is lacking which causes challenges for organizational cohesiveness and unity. Most career employees spend 17–25 years in the same department. In public bureaucracies, many administrative officials hold position for life. Noted sociologist Max Weber contends that securing tenure does not always mean the official has improved his status; rather in some cases, he may feel stuck (Stillman 2010). This also creates a problem in the organization as there are limited opportunities to move up which prevents prime candidates from applying as they do not want to be stymied from advancement. A balance must be struck between officials having security in the position and opportunity for associates to advance (Stillman 2010). Other scholars contend that effectiveness of the agency provides these employees more job satisfaction than advancement (Boardman and Sundquist 2009). Norton E. Long contends that the structure of the administrative branch makes it both intent on growth and adverse to change. The agency must secure more power to ensure its survival, yet reorganization is difficult in part because of tenure (Stillman 2010).

Perhaps the most voiced issue is the fear of being stuck with a bad employee. Less than 1% of the federal workforce is fired for bad performance/conduct (Government Accountability

Office 2015). In a report to the Committee on Homeland Security and Governmental Affairs and the Senate, the Government Accountability Office made three suggestions to combat performance issues with civil servants that are able to obtain tenure: First, supervisors need training in performance management in order to better identify issues, communicate expectations, and address actual execution issues. Second, the 3-year probationary period needs to be better utilized to extract problem employees. And third, if there is an issue, the employee needs to be terminated during the probationary period as the process after it expires is convoluted at best (Government Accountability Office 2015). One bad apple spoils the bunch – if a bad employee progresses into tenure, he will negatively affect fellow employees, service delivery to the citizens, and even outward perception of government. It has a snowball effect that can negate the overall effectiveness of administrative programs and the future power of the agency.

## Conclusion

Most people in the American workforce do not have tenure and will never attain it. They must struggle to keep their organization, manager, coworkers, and customers contented in order to remain employed. There are constant public discussions about the need for a livable minimum wage – most government jobs, though not exceptionally lucrative, pay more than the minimum. Americans outside of this system may therefore view government jobs which provide what they see as unattainable wages and job security as entitlement and view tenure as unfairly applied. Government must better communicate to the public that keeping an internal set of checks and balances within public agencies by employing a mix of tenured and appointed workers prevents corruption.

Americans inside this system may feel unmotivated as tenured employees. They may become complacent and stop their personal professional development. If the individual feels stuck, is bored, and begins waiting to retire, the organization can become inefficient. These internal issues, however, are certainly not unique to the public sector. Organizational theorists find these issues in private industry as well. Any operation needs to offer professional development opportunities to increase the expertise of the long-term careerist and allow him to master his lifelong position as well as a mix of jobs that allow for promotion to meet the needs of a diverse talent bench with leadership aspirations. Regular performance management with goal setting and strategic planning sessions will help all varieties of employees stay on a successful career path. The job satisfaction that comes from working with an agency for a long time and serving the public good is also intrinsically motivating. Both the public and private sector benefit from continuing work in performance management training, skill development training, and the study of organizational behavior.

# Termination of Nonprofit Organizations

Dorothy Norris-Tirrell
Academic Affairs and Research, Nonprofit Leadership Alliance, Kansas City, MO, USA

## Synonyms

Bankruptcy; Closure; Dissolution; Organization death; Organization failure

## Introduction

Private nonprofit organizations serve many purposes in modern society such as provision of a wide range of social and health services, advocating on behalf of special groups, and supporting research and community awareness around issues including historic preservation and disease prevention. Nonprofit organizations have worked collaboratively both with and alongside government for hundreds of years, often evolving to meet changing needs and environmental pressures and sometimes closing their doors. The closure of a nonprofit organization due to the successful resolution of the problem or issue targeted by its mission is the ultimate measure of success. However, nonprofit organizations can face termination for reasons other than success that may leave needed and desired services not provided or not provided sufficiently to meet demand or need (Norris-Tirrell 2001).

This entry focuses on understanding why nonprofit organizations end and how they can complete their work effectively. The first sections briefly examine the concept of organization termination and set it in the nonprofit context. The processes of nonprofit organization termination including opportunities for organization renewal and merger or consolidation are presented. The final section offers strategies for honorable nonprofit organization closure.

## Defining Organization Termination

Research on organization termination is found in a range of academic disciplines and subdisciplines, including public administration, business administration, and organization theory. Each brings a different focus to understanding why and how organizations end. Much of the literature for both for profit and public organization termination is useful to examining the nonprofit organization experience.

**Public Administration: Organizational Immortality.** Rooted in Herbert Kaufman's (1976) infamous question "are government organizations immortal?", the public administration literature examines policy, program, and organization termination by focusing on the causes of termination and why public institutions resist termination. For example, public organizations both passively and actively resist termination as the result of psychological reluctance, institutional permanence, dynamic conservatism, anti-termination coalitions, legal obstacles, and high start-up costs (de Leon 1983).

**Business Administration: Financial Failure.** Organization termination from a business administration perspective focuses on the avoidance of financial failure, typically defined as the dissolution of the private firm resulting from bankruptcy. Much emphasis is given to predicting bankruptcy through financial ratios and formulas that measure undercapitalization, excessive debt, decreasing profit margins or emphasis on short-term profits, and inadequate maintenance and depreciation.

However, the most widely quoted model of business failure argues that financial ratios indicate symptoms of business failure rather than causes (Argenti 1976). The more complex and dynamic models include a mix of variables including the interaction of managerial defects; poor, nonexistent, or manipulated financial information systems; levels of debt; and the occurrence of "normal business hazards" such as strikes or the loss of a large customer.

**Organization Theory: Internal and External Factors.** Two areas of organization theory examine organization termination. The first area, organization ecology, focuses on the impact of the external environment on organizations and the capacity of the organization to adapt. This capacity is influenced by the organization's age and size. A second area studies the various stages of organization evolution that mimic the human life cycle. While the chronology is argued to be flexible, organizations tend to follow a pattern of development: conception and organization birth; adolescence where the organization struggles with internal coordination; adulthood and mastering of the organization's environment; and finally, old age where choices are required regarding revitalization, atrophy, survival on the margin or death (Kimberly and Miles 1980). Limited research has examined the final life cycle stage, death.

## The Nonprofit Organization Context and Termination

While the three organization sectors (public, nonprofit, and for profit) share many characteristics and are influenced by many of the same internal and external factors, a few unique characteristics distinguish the nonprofit organization. The first characteristic is the volunteer board of directors that serves as the legally liable body of an incorporated nonprofit organization. This group is responsible for hiring and overs the executive director, ensuring the organization has the resources needed for mission implementation, and monitoring the organization's legal and financial status. The second identifying characteristic, the nondistribution constraint, explains that nonprofit organizations are not allowed to share their net earnings with its leaders. If the nonprofit is recognized by the US Internal Revenue Service, the organization's classification may provide additional unique characteristics. For example, nonprofits recognized under IRS Code 501(c)(3) can allow donors the opportunity to deduct their contributions on individual or corporate income tax returns.

These differentiating characteristics help explain the complex setting in which a nonprofit organization operates and dies. Like public organizations, termination is not a common event for nonprofit organizations. In fact, nonprofit organizations have been known to change their missions rather than dissolve the effective organization. The classic example is the March of Dimes. Founded in 1938 as the National Foundation for Infantile Paralysis with the mission to eradicate polio, the "March of Dimes" proved to be a successful model to fund research and medical intervention. In 1958, the Foundation changed its mission to birth defects prevention and in 1979 revised the corporate name to the March of Dimes Birth Defects Foundation.

Not every nonprofit organization, however, evolves in this way. The life cycle concept proves useful to understand the stages of a nonprofit organization's evolution and the pertinent structure, process, and outcomes associated. At each stage, nonprofit organization's key actors face a new set of challenges and opportunities:

- **Stage 1: Exploration** – Conveners initiate the option of a nonprofit organization as a means for meeting their goals.
- **Stage 2: Formation** – Initial structures and processes are developed as the group formally incorporates via state government. IRS recognition may be sought. Note: Nonprofit organizations are not required to incorporate but typically do so when the funding is needed.
- **Stage 3: Growth** – Organization actors struggle to build consensus on goals and implementation strategies.
- **Stage 4: Maturity** – Ideal state of the organization with successful goal achievement and resources available.
- **Stage 5: Ending** – The nonprofit organization's work is done and, ideally, celebrated.
  - **Stage 5a: Decline** – An intermediary stage that may lead to renewal or dissolution based on nonprofit organization actors and stakeholder perceptions.
  - **Stage 5b: Renewal** – Reinvention of structure, processes, and outcomes with the goal of re-entry into healthy organization lifecycle.

Important to recognize is that organizations do not necessarily follow the life cycle stages in the same order. Ending or dissolution can come during the growth stage, before the nonprofit organization has reached a point that might produce the best success story. The way in which leaders, volunteers, staff, and other participants transition from one stage to the next greatly influences the potential for survival and success. The transitions are not necessarily obvious, and the same tactics that produce success in one stage can create frustration and failure in the next.

Conceptualizing organizations as an evolutionary process offers nonprofit leaders fuller, deeper, and practical insights into planning and diagnosing organization issues. In addition, to the organization's life cycle, key actors must attend to the ongoing influence of the organization's context, particularly the environmental dynamics that continually impinge upon decision making and implementation.

## Decline: The Beginning of the End

What brings the nonprofit organization to the Decline Stage includes a range of internal and external factors. Internal factors typically center on poor management and leadership. External factors, while outside of the organization's direct control, may require the organization to adapt – again falling to the nonprofit's managers and leaders. The first type of external changes build from the dynamic environment in which nonprofit organizations operate including changes in their target population, trends in a given policy areas (e.g., housing or health care) or the primary staff disciplines critical to the organization's work such as psychology, social work, or nursing, technological advancements, and increasing competition for resources. In particular, competition among nonprofit organizations is growing due to the increased numbers of nonprofits and the decreased dollars available from government, corporations, and individual donors.

Another type of external driver focuses on the perceptions and demands of important organization stakeholders, in particular funders. For example, a funder may perceive that too many agencies serve the same population or provide the same service resulting in unnecessary duplication. While some duplication of services may assure that needs are addressed, extensive duplication confuses clients and funders – reinforcing the concept of competition among nonprofits for resources.

For many nonprofit organizations, the declining state is the beginning of the end. Most clearly evidenced by the lack of financial resources required for organization survival, decline can also be indicated by decreasing number of committed volunteers, an ongoing struggle to recruit board members and fewer appropriate clients. In this state, the organization may be approaching bankruptcy and actively discussing their future. The emphasis of meetings is on uncertain resources and survival with a status quo vision. In some cases, the organization may exist in "name only" with only a few board members maintaining a bank account. At some point in Decline Stage, revitalization or renewal may be attempted.

Revitalization begins with a discovery process to understand why the organization is failing, to examine the "pathologies" of the participants, processes, and external context. Open communication is essential in determining whether the organization should dissolve or renewal is a possibility. After the problems and barriers are recognized, organization leaders and participants must move beyond normative and "wishful" thinking to explore the possibilities of what can happen next. This potentially time-consuming step is necessary before a grounded decision about next steps can be made. Often "outside" experts or facilitators are needed early in Renewal Stage. Outsiders bring an important "neutral" perspective to identify barriers, problems, and opportunities. Deliberate and intentional decision making about the next step is critical to determine whether the organization will move to formal dissolution and closure or can a conscious and strategic effort lead to renewing the organization toward identified outcomes.

## Avoiding Termination: Merger or Consolidation

Funders and sector leaders have been supportive of nonprofit organizations combining as a strategy to serve more clients, increase administrative efficiency, and more effectively utilize limited resources. Others view nonprofit organizational merger or consolidation and the larger organizations that result as a threat to the core of the nonprofit sector – small, innovative, grassroots organizations that focus on a narrowly defined target population or niche. In a merger, one organization is the "host" accepting the assets and liabilities of the "merged" organization. In consolidation, both organizations are dissolved and a new consolidated entity is created. The motivations for merger or consolidation range from a strategy for an organization's programming to survive to a desire to grow or expand services horizontally or vertically. From an administrative efficiency perspective, merger may be seen as a mechanism to increase economies of scale, to reduce administrative costs, and to save money on everything from daily operational supplies to volunteer liability insurance. Effective merger processes are hard work and require attention to physical, legal, and psychological elements. The three short examples that follow illustrate the circumstances common to merger and consolidation in the nonprofit sector:

- Two nonprofit organizations who serve similar target populations but with different services decide to consolidate and create a new nonprofit organization. Both organizations legally dissolve and move their assets to the newly created organization. As a result, a larger pool of clients has access to increased scope of services while donors and funders can support an efficient and focused organization.
- An agency about to "go out of business" due to inadequate cash flow sought out a "savior" organization so that their clients would continue to be served. In this case, the agency that accepted the "mergee" acted as a host organization, gaining some financial assets and an increased scope of services to offer. The merged agency dissolved but was able to negotiate to keep the agency's name as a program, and at least in the short term, maintain a power base through board appointments.
- Although more common in the for-profit sector, nonprofit agencies can acquire other nonprofits. In this case, the transaction included money changing hands and the relinquishing of all autonomy and decision making authority. This type of merger follows the private sector strategy of bottom trawling, the practice of seeking weakened but salvageable competitors. The merged organization reduced competition and increased market share in terms of clients, staff experts, both important in a tight resource environment.

Merger can also be perceived as a negative if viewed as a loss of autonomy and identity for board members, staff, and volunteers who have invested energy and loyalty in the organization and its mission. The common fear of the unknown is coupled with a fear of losing job security and status. This type reactive mindset may prefer termination to merger.

## Wrapping up the Nonprofit Organization: Successful Termination

When the decision to end is imminent, nonprofit organization leaders have the opportunity to ensure that the organization does not fade slowly away with loose ends; instead leaders can take a proactive role to assure that termination, closure, and dissolution is handled appropriately and with care.

Organization dissolution or termination may result because the organization has successfully resolved the problem or issue that it was formed to address or organization actors determine that the current organization effort has gone as far as it can go. Regardless of why the nonprofit organization is ending, the organization's work should be celebrated with individual effort recognized and results broadly shared.

As a first step toward nonprofit organization dissolution, the organization's board of directors should make an intentional decision, evidenced

with a documented motion and vote, to terminate the organization by relinquishing its nonprofit charter and ceasing to exist, and to develop ending processes that reflect open, ethical decision making, and formalize closure. The processes include liquidation or transfer of all assets and liabilities. The organization's bylaws may clearly state the recipient of the assets in case of dissolution or may simply state that they will be distributed to a similar nonprofit organization. The process may take a few months and require the participation of the full board or an appointed subgroup.

As the dissolution decision is made, specific expertise may be needed including lawyers and accountants. Organization leaders should not hesitate to bring in needed knowledge and skill so that the ending process is handled with appropriate care.

To celebrate the work of the organization and document programs, processes, actors, and impacts in an accessible format. A local public library or a website may be appropriate locations for archival. Importantly, archival allows future interested parties to learn from the organization's work and avoid unnecessary pitfalls. In addition, events may be held to recognize key participants and to publicize the overall impacts of the organization's work. Finally, the organization's work should conclude with honor by informing current and past participants and stakeholders of the collaboration's dissolution, emphasizing positive impacts, lessons learned, and recommendations for future action.

The official processes of nonprofit organization dissolution are simple and straightforward. After the organization's board of director's vote to dissolve, the state office where the organization was incorporated should be notified of impending organization termination and a request for a certificate or articles of dissolution filed. Each state varies on the specific forms and procedures. If the organization is recognized by the IRS, a final IRS Form 990 should be filed, checking Box B on the first page to indicate Final Return/Terminated and including Schedule N, Liquidation, Termination, Dissolution, or Significate Disposition of Assets. Other state or federal agencies may need to be notified if the organization had employees or held licenses.

## Concluding Points

Some private nonprofit organizations intentionally dissolve their charter for very positive reasons. For example, when through the organization's efforts the issue for which the nonprofit was formed has been resolved. Others end their work because they run out of resources, such as revenue, clients, or volunteers willing to dedicate their time to the organization's mission. Still other nonprofits suffer a slow, potentially long decline as services or programs diminish and organization leaders ignore critical decisions about the organization's future.

The final and least studied stage of the nonprofit organization life cycle is organization death. The existing research argues that organization death is a natural consequence of the organization life cycle resulting from the organization's failure to adapt to its changing environments. The dynamic environment in which nonprofit organizations operate calls for leaders, both paid and volunteer, to respond to changes with wisdom and passion. However, when time is right, organization termination can and should be an option for ensuring that precious resources are used to effectively serve clients and constituencies.

# Territorial Fiscal Self-Rule

Franz Xavier Barrios-Suvelza
Faculty of Law, Social Sciences & Economics, University of Erfurt, Erfurt, Germany

## Synonyms

Fiscal autonomy; Fiscal decentralization; Fiscal federalism

## Definition

As a topic of public finance, territorial fiscal self-rule addresses the most decisive territorial fiscal balance point, in which so-called *internal* own revenues – i.e., a narrow subset of own revenues – back the spending needs derived from assigned functional responsibilities upon which the sub-state unit has real policy decision-making.

## Introduction

The concept of territorial fiscal self-rule (TFSR) differs from its closest cognates, such as fiscal federalism, fiscal decentralization, or financial autonomy. It is not burdened by the "federal bias" as the first concept is, nor distracted by the discussion whether "decentralization" encompasses deconcentration or other kinds of decentralization (political, administrative, and electoral) as in the second concept, nor is TFSR centered exclusively around the tax domain as in the third cognate concept. It is also not equal to the concept of "regional economic self-rule" (Sorens 2014), because TFSR's concern with the functional side is not reduced to economic affairs and, as will be shown below, gives some specific *transfers* a decisive role in achieving territorial self-rule. In any case, TFSR is not interested in whether the territorial fiscal arrangement of a country leads it towards market economy (Weingast 2014), liberalism, or, for that matter, towards democracy (but see Breton 1993).

While TFSR is not about the major issue of the "vertical structure of power" (Breton 1993), TFSR absorbs, in a condensed way, decisions taken upon this structure of power. In other words, TFSR not only relates to pure financial issues but also to the material side implied in functional (Bird 2005) or sectorial responsibilities, thereby considering the territorial organization and structure of the state, and the alternative regimes that regulate the relationships between financial issues and the material side. These different regimes also encompass the possibilities of substate units to override mechanisms that may limit their revenue and spending power, acknowledging the fact that to have no limits at all does not seem plausible.

In line with many scholars, the TFSR approach endorses the critique of how pointless it is to merely count revenues or spending amounts in substate units' hands relative to the total revenues or expenses of the whole public sector, without asking how much discretion these units really have upon their fiscal arrangement (Stegarescu 2005: 302; Hooghe et al. 2008: 127; Sorens 2014: 244; Gemmell et al. 2013: 1918). In contraposition to current approaches, however, TFSR first decouples fiscal self-rule from its anchoring mainly upon the tax capacity of territorial entities, and more specifically, upon own-source revenues. Second, the concept of TFSR is systematically linked to considering the domain of functions or "programatic autonomy" (Sorens 2014: 244) and asks, in a principled manner, how far is the authoritative reach of the territorial entities' decision-making over these functions. Third, the dimension of functional responsibilities is understood as something underlying, but not collapsing with, the spending side, which in itself has to be integrated into the concept of TFSR along with the revenue side. Fourth, based on these premises, TFSR is broken down into different types, built in search of the setting in which some kinds of own revenues match the domain of functional and spending responsibilities upon

which the territorial entity has real decision-making.

### Decoupling TFSR from Tax Power and Own-Source Revenues

TFSR is based on the category of territorial *own revenues*, whereby taxes directly applied by the corresponding territorial entity – in spite of all the positive incentives that they may trigger in terms of allocative and productive efficiency (Slack 2017: 3) – are only part of a multitude of resources that also confer some degree of fiscal freedom to the territorial substate unit and that are not absolutely bereft of incentives in terms of allocative and productive efficiency. The backbone of territorial own revenues are *unconditioned resources*. These are those, whose sectorial destination is not predecided through a territorial authority other than the one exercising the corresponding spending power. Since the criteria of unconditionality builds upon the silence on the part of the granting territorial entity concerning the sectorial destination of territorially granted resources, the definition of unconditioned resources endorsed here is not based (but see Yilmaz et al. 2012) on the rule-driven quality of allocation of such resources, nor on the use of objective parameters that define the criteria for their territorial imputation. Moreover, unconditioned resources should not be confused with resources of a general purpose (but see Stegarescu 2005: 309). The "general purpose" relates to the roles that revenues may play (other roles being lowering disparities, capturing externalities, to name a few) in the whole system of revenue assignment, whereas "unconditioned" relates to the quality of resources. Therefore, unconditioned recourses may finance equalization systems, thus ruling out their role as a means for backing general purposes of the territorial entity. In the opposite case, namely, conditioned resources, the predetermination of the sectorial destiny on the side of the granting entity may be broad (i.e., so-called block grants) or narrow, and the fulfillment of this destination is expected to be verifiable by the entity granting the resources to the executing substate unit. Because here the definition of conditionality is mainly linked to the sectorial destination of territorial resources, it does not encompass – as is usually the case in mainstream literature – several exigencies that may accompany the transfer of resources such as matching grants, administrative skills on the side of the recipient, or the presence of some socioeconomic indicators that qualify a recipient for these transfers. To understand the complete idea of TFSR, it is also important to underscore that conditionality ends when beyond the assertion of a sectorial destiny for granted resources, the granting entity interferes in operational and concrete processes implied in the expenditure dynamic through commands directed towards the recipient entity. If this were the case, not conditioned, but the even more constraining category of territorial *heteronomous* resources emerges.

According to all these premises, even transfers may count as part of own revenues of territorial entities if these transfers have the quality of unconditioned resources. It does not matter, in this context, whether transfers are classical ones (meaning already budgeted resources stemming from an upper territorial level), or transfers accruing to substate units following constitutional mandates that rule the apportionment of resources to the substate domain without intermediation of any previous politically bargained annual territorial current budgets.

Assuming the idea of own revenues based on unconditioned resources broadens the scope of the substate's fiscal self-rule in comparison to the strong tradition of scholarship in fiscal federalism to focus on own-source tax revenues as *the* reference for virtuous territorial revenue (so Slack 2017: 12). Some authors concede that "general purpose grants" may be classified as "own or free revenues", but are reluctant to base any kind of "financial autonomy" on them (Stegarescu 2005: 309). The view presented in this entry forces the observer to methodologically break down different components of territorial resources (own sources taxes being only one of them), to rescue unconditioned resources by contrasting them stronger against conditioned ones (Ladner et al. 2016: 327), and to scrutinize these unconditioned resources in order to

determine the varying degrees of *influence* (Hunter 1977) recipient territorial entities may exert upon the revenue assignment process in the state. The fiscal space of substate units expands to the extent that this influence becomes more decisive. Under some circumstances, the influence may even affect the amount of resources allotted, as may be the case when territorial entities bargain tax sharing quotas (Stegarescu 2005: 308; Gemmell et al. 2013: 1920). In other words, the phenomena of unconditioned resources seems to imply more than simply a future non-constrained sectorial spending, namely something that may even reach the generation of resources.

It could be argued that relying on this understanding of own revenues, which includes tax sharing, overlooks that the national level may behave strategically, frequently bringing the whole system of territorial revenue assignment into instability. However, taking a look at the historical records of several federal countries that over decades have financed their respective equalizations systems through unconditioned resources (Bird 2005), it becomes clear that a central government committed to steady unconditioned transfers is possible. To be sure, this stability is more likely the more such agreements are constitutionally entrenched, and the more the corresponding society has a tradition of "legal culture".

## The Rationale of TFSR

Drawing on the idea of own revenues, as those whose backbone are unconditioned resources, redirects the attention to the pragmatical needs of territorial entities to cope with their responsibilities with varying degrees of freedom, away from lamenting over the difficulties to match spending responsibilities only or mainly to own-source revenues. Thus, the question now is how territorial own fiscal decision-making may be achieved to different degrees even under circumstances of weak own-source revenues, and how a package of functional responsibilities can be assumed, differentiating those, whose content is decided at the substate domain; from those whose content is decided in an upper territorial level but the executing substate unit is free to administer the operational details; and from those upon which the upper level has both policy and administrative command upon the responsibilities delegated to the substate unit.

## The System of TFSR

As has already been suggested in recent literature on fiscal federalism and fiscal decentralization, the concept of TFSR also insists in considering both sides – revenue and spending – for approaching this topic more systematically (Gemmell et al. 2013: 1922). If necessary, "autonomy to borrow" and "budget autonomy" could be ascribed respectively to revenue and spending sides of TFSR. For assessing the degree of TFSR an evaluation of the quantitative magnitude of the different kinds of revenues that underlie TFSR, relative to the whole aggregation of territorial revenue available, is advisable (Ladner et al. 2016: 327; Stegarescu 2005: 309). Having said that, distinguishing specific types of TFSR starts by marking out in which fields the respective territorial entity enjoys a real capacity of policy-making, or in other words, "policy scope" (Hooghe et al. 2008: 126). In general terms, this capacity is best approached by simply asking where can the entity legislate, whereby legislation is narrowly understood in the sense of "primary legislation" (Baldwin 2003). Alternative terms such as "authoritative decisions" (Hooghe et al. 2008: 126), or "independent … decision making" (Ladner et al. 2016: 332) are not clear enough for the purpose here. Both terms can be applied to situations in which substate units are free from administrative supervision from an upper level, but are still unable to make decisions on policy. Because legislative capacity, in the sense of primary legislation, is normal in *composite* states – such as federal ones – as here substate units of the intermediate level enjoy true legislative capacities, the idea of TFSR applied to *simple* states demands closer clarification. With regards to simple states – conventionally known as "unitary" ones – one can substitute the demanding parameter of primary legislation with rulemaking of a *general* scope, despite the fact that the latter are rules below the scale of primary legislation.

Following these premises, eight types of TFSR are presented here, four on the revenue and

four on the expenditure side. On the expenditure side, the weakest alternative is named *fiscal self-administration,* in which those tasks are considered upon which the upper level decides the specific sectorial destination. Though weak, this scenario is considered as part of the whole system of TFSR because, as explained above, while the upper level determines the sectorial destination, it refrains from intruding upon the operational details of the spending process, leaving thus some decisional freedom for the executing territorial entity. The next scenario can be labeled *fiscal self-decision,* in which no specific sectorial exigency is expected from any upper level, granting the substate units much more fiscal freedom. A third scenario emerges if one looks at those functional responsibilities upon which a substate unit does have real influence on policy. In such a case, *fiscal self-determination* on the expenditure side arises. It is at this point where TFSR attains, as far as the spending side is considered, its most important expression. The last type is the extreme opposite to fiscal self-administration, namely, *fiscal self-prioritization*, meaning the spending on tasks of which can be assumed that consumers are explicitly willing to pay for their provision. For completing this system of types of TFSR on the expenditure side, it is now useful to see how the parameters on the revenue side dovetail to the just described parameters. The first parameter on the revenue side is called *fiscal leeway on the revenue side,* meaning some degree of fiscal maneuvering for the substate unit even if employing conditioned resources (Slack 2017: 4). The second is *fiscal independence,* meaning the possession of own revenues. This mirrors the situation described with fiscal self-decision on the spending side. It may be that some portions of own revenues have to be channeled towards areas of public policy upon which the respective substate unit has no policy-making decision, despite executing them without commands from the upper level. In fact, the mere existence of own revenues does not tell whether the territorial entity is financing mainly tasks upon which it has real decision-making. The third type emerges by subtracting those resources from the category of own revenues, which are absorbed for financing responsibilites over which the upper level has policy decision power. In such a case one reaches the category of *internal* own revenues, which underlie *fiscal self-government*. In this understanding of self-rule, one does not have to wait until the generation of own-source taxes is attained in order to speak of self-rule. True, this last category combines transfers, grants, and other revenues, which are both unconditional and not available for financing external policies. However, among these revenues are those upon which the territorial entity has the power to really decide – as in the case of own levied taxes – upon amount, the base, and/or the rate without depending on any upper level (Ladner et al. 2016: 335). The fourth scenario in which this is possible is called *fiscal autonomy* on the revenue side. As one can already see, as important as this last scenario might be for accomplishing many virtues concerning accountability, efficiency, and financial sustainability, seen from the perspective of the TFSR understood as a system, one has to consider many other different scenarios and combinations, whereby the ideal balance point is the one in which internal own revenues match those responsibilities upon which the territorial entity has real policy-making power. Before turning to this virtuous territorial fiscal balance point, the eight types of TFSR are presented in Fig. 1.

## Same Territorial Fiscal Balance with Counterintuitive Ratios of TFSR

The point at which internal own revenues match responsibilities upon which the entity has decision over policy-making (this point shall be named *alpha* balance point) represents the decisive balance point from the perspective of TFSR. But this is still only one territorial fiscal balance point among others, as, for example, one in which even delegated tasks from an upper territorial level are appropriately covered by reimbursement payments stemming from the delegating entity. The construction of TFSR as a system built by several revenue and spending types not only allows us to understand that TFSR is about degrees of financial freedom of the territorial substate unit but prepares us for the likelihood that the same balance point which is decisive for TFSR

**Territorial Fiscal Self-Rule, Fig. 1** Types of fiscal self-rule on the revenue and expenditure side

may be achieved by combining counterintuitive ratios of the different types of TFSR. In other words, it could be that a substate unit has weak "fiscal autonomy" – if under fiscal autonomy only own-source revenues are considered (Slack 2017: 4) – but at the same time exposes a remarkable TFSR. Thus, the alpha balance point may be achieved in time $t+1$ by decreasing the ratio of own-source revenues relative to total revenues compared to time point $t$. For illustrating this phenomenon, a highly stylized example is presented in Fig. 2. Assume that in period $t$ a substate unit X exerts real policy-making power through own legislative power upon the field of education, but only executes (without any saying on policy matters) in the field of health. Assume further that for accomplishing these responsibilities in education and health unit X has received a massive amount of a portion of income tax collected by the national level in the form of unconditioned resources, which is constitutionally split between the national and the substate level which unit X is part of. Now assume that in period $t+1$, the constitution rules that in addition to education, the field of health also becomes a sector upon which unit X can legislate. Before this new arrangement is enforced, let us remember that both sectors were already financed by unit X with the only difference that in the education sector it had legislative power to regulate policies, whereas in the health sector it had not. Hence, because the new field represents costs that were already covered by unit X's financial structure during period $t$, no significant change in the financial needs of unit X arise. For rounding up this example, assume finally that in period $t+1$ unit X is able to slightly increase its own-source tax revenues, which are being reinvested for delivering better services in both education and health. Now, if one compares unit X in period $t$ to period $t+1$, the alpha balance point is achieved though under different ratios of TFSR. As can be seen in Fig. 2, while in period

**Territorial Fiscal Self-Rule, Fig. 2** Modeling the generation of a balance point of type "alpha"

*t+1* the degree of fiscal self-government has markedly increased, the degree of fiscal autonomy has barely done so. The ratio of own-source revenues relative to the package of responsibilities upon which unit X exerts policy influence has even decreased. In sum, the attainment of a broader TFSR has been achieved even by a rather modest or decreasing development of own-source revenues.

### The Vertical Dimension of TFSR

The approach entailed in the concept of TFSR includes taking the fact into account that fiscal self-rule at the scale of each territorial entity is one thing, and another thing is the manifestation of TFSR considering whole territorial levels (Bird 2005). What each single territorial substate unit may receive in the form of revenues is often mediated by huge processes of revenue distribution that previously occur among territorial state levels. The prospects of territorial fiscal self-rule of each single entity may be thus partially prefigured in the way large masses of tax revenues are apportioned among levels before each entity gets its specific lot. Likewise, responsibilities are actually often distributed in the constitution, whereby whole packages of sectors are assigned per level.

### The Structural Dimension of TFSR

Depending on the territorial state form, territorial entities belonging to a respective territorial level possess diverging prospects of TFSR. In composite states, such as federal ones or so-called autonomic states like Spain or Italy, the predominant role of the intermediate level, under which the municipal level is made invisible, may trigger decisive constraints on the pattern of revenue assignment. Thus, the constitutional framework may not only influence TFSR because of being the mechanism through which responsibilities are assigned, or because in it lies one of the main sources for institutional predictability and constraint upon the national level to abide fiscal agreements, but because of the impact the state form itself exerts upon the revenue assignment system. The territorial state form influences, for instance, the status of major cities and their financial strength (Slack 2017: 4).

## Conclusion

The concept of TFSR entails a systemic view of the different ways and patterns of substate units' financial capacity for coping with their responsibilities, provided some degree of fiscal decisional freedom is detectable. It is distinguished from related concepts such as financial autonomy, fiscal federalism, and fiscal decentralization; because it is nonfederal-biased, it has a more realistic stance concerning own-source revenues, and it systematically considers regimes of state authority that link different components of revenues and spending to the distribution of functional and spending responsibilities. Future research may enhance this approach by increasing the supply of data covering details on the real decision-making power upon responsibilities (Stegarescu 2005: 326), and details concerning the costs implied in each functional responsibility.

# Territorial Governance

Irina Ilina and Evgenij Pliseckij
Department of Public Administration, Faculty of Social Sciences, Institute for Regional Studies and Urban Planning NRU HSE, Moscow, Russia
Department of Public Administration, Faculty of Social Sciences, Institute for Regional Studies and Urban Planning, Spatial Development and Regional Studies, Higher School of Economics, Moscow, Russia

## Synonyms

Spatial organization of the territory; Territorial development policy

## Definition

A course of action undertaken in a particular region with jurisdiction and powers of public servants to organize the production, placement, and development of productive forces and improvement of ways of involving in economic circulation of resources of the territories, based on national economic interests.

## Introduction

Social and economic development of the Russian Federation is closely associated with the problems in spatial distribution of production inputs and spatial development management, given the huge area occupied by the country. One of the key issues of the national economy is a choice of the most suitable organizational and economic mechanisms for spatial (territorial) development. Following the principle of separation of functions and responsibilities between various levels of power, Russia retains spatial development policy design and associated resource distribution at the federal level. However, significant changes in the RF legislation since 1991 have modified an economic framework of the territorial governance. Regions have more opportunities now, along with higher responsibilities, for land and property management, investment mobilization, infrastructure maintenance, solution of social problems, and provision of public security.

***Territorial economic system (TES)*** may be defined as a sustainable combination of well-connected enterprises and sectors resulting from the distribution of the national production factors. Successful TES performance and development depend very much on the efficient use of territory's resources and regional specificities, the latter falling into three main groups:

1. Availability of natural resources, their diversity and stock, nature and climate, and environmental status
2. Availability of human resources, including total number of people, gender and age structure, workforce numbers and structure, education and qualification level, and regional distribution of the population
3. Economic and geographic advantages, defined through a proximity to the most developed internal and external areas and to the transportation infrastructure

Territorial governance may follow two main practically opposite approaches. The first approach seeks equalization of social and economic development of the areas through powerful government support of weaker regions; the second approach focuses on points, poles, or engines of growth. In a short-term perspective, Russia would inevitably remain a country of uneven spatial development, dooming artificial equalization of disproportions to ineffectiveness. Hence, the government territorial governance policy should create stimulating institutional framework for independent regional growth.

Governance of territorial organization and regional economic development with limited resources shall focus on points or poles of growth, capable of providing impetus to economic activities in larger areas. The Russian spatial development priorities shall be revised as soon as some policy objectives are achieved, taking into account the changing environment. A concentrated support at the initial stage of the most competitive sectors and territorial poles of growth would boost the economic growth. The poles of growth are seen as future catalysts for development of other territories.

Modern *forms of territorial organization of economy and population distribution* in Russia vary a lot and work in all the regions in various degrees. Many current forms emerged in the process of historic development of the country.

There are some key forms of spatial (territorial) organization of economy:

- ***Locality*** – an elementary unit, location (small territory) with one object situated there, that object being a settlement, a production, or infrastructure facility. Hence the typology of localities defined by their functions (settlement, production, recreation, etc.) Territorial combinations of localities generate population dispersion pattern and spatial economy distribution.
- ***Industrial hub*** – a combination of production facilities (belonging to one or interrelated industries) together with the supporting utilities and transport and social infrastructure facilities within a compact territory.
- ***Transportation hub*** – a node of transport arteries of various types (railroads, air traffic, automobile roads, etc.), usually in combination with major settlements.
- ***Territorial and production complex (TPC)*** is an aggregate of economically and technically interrelated production facilities regardless of forms of ownership and sector, within a specific area limited by administrative or natural geography boundaries, sharing resources and infrastructure. The TPC industrial focus and scope play an important role for interregional, national, and even global markets. The TPCs in Russia have resulted from the development of new areas with rich natural resources, being a good tool of saving on capital investments. The examples are Southern Yakutia and Sayany TPCs, specializing on power generation and nonferrous metallurgy, respectively.

Improvement of the territorial organization of the Russian economy is built upon the *territorial zoning* principles supporting:

- A balanced development of natural and urbanized areas
- Combination of intensive and functional use of areas justified from environmental, social, and economic points of view
- Development of a unified system for population distribution, natural and urbanized landscapes, and spatial environment
- Construction of low-rise buildings, business areas, technoparks, and so on

Territorial planning seeks to define prospective functions of territories in the relevant policy documents based on social, economic, environmental, and other factors to ensure their sustainable development, improvement of engineering, transport and social infrastructure, securing the interests of people and their associations, and the interests of the Russian Federation, its constituents, and municipalities.

Russia has been recently favoring a new form of territorial organization of production – clusters. Being a new form, in its substance it is very

similar to industrial hubs and territorial and production complexes.

Clusterization in this model is understood as a number and strength of meaningful cluster groups in the region, being a constructed replacement variable for the indicator of quantity and level of cluster development in the region.

*Territorial cluster is a geographically localized voluntary association of various entities (firms, banks, research institutions, universities, and the like), cooperating in different types of entrepreneurial activities (in manufacturing and service sectors) to improve competitive advantages of all its participants*.

A more focused understanding of a cluster is more popular in practice, where a cluster is understood as a constellation of economically related and closely situated firms of similar profiles, with vertical manufacturing relations concentrated around head firms or a group of their base enterprises, those firms specializing in manufacturing, delivery, or trade of products in a limited range of economic sectors.

Apart from major companies producing end-use products and making up a cluster core, it also involves medium and small businesses driving innovative aspect of cluster growth. Territorial clusters make a positive impact on the regional economy through employment and investment growth, accelerated implementation of innovative technologies, and so on.

A cluster has a number of common and special features. The common cluster feature is a geographic concentration of entities in a specific sector. Special cluster features include a presence of a critical mass of cluster participants and a high level of their connectivity and innovative activity.

The cluster development experience has proven that a cluster approach to economy management boosts the production efficiency because of interconnected and proportional development, implementation of joint projects, and cost savings.

Territorial tourist cluster, for example, includes transport companies, culture and entertainment facilities, hotels, restaurants, and museums, in addition to specialized travel agencies. Cluster approach provides a positive impact on labor productivity growth, promotes innovations, and simplifies their commercialization. Associations of small and medium handicraft businesses or domestic service providers may serve as examples of entities with high interconnectivity.

***Protocluster*** (potential cluster) is an aggregate of entities with some but not all cluster features.

A pilot program of innovative cluster development is currently under implementation. Aviation and space cluster in Samara Oblast, biotechnology cluster in Chernogolovka City of Moscow Oblast, and some others mobilized government support under the program.

Government regulation of territorial development from the federal center includes mostly the current and investment support of regions.

Global practice over the recent 40 years has proven that most of territorially diversified countries with high and sustainable growth rate got there through faster growth of a limited number of regions. Leading regions, being poles of growth, become centers of country development, involving innovative, investment, and social areas.

A new federal law is in line with the purpose of stimulation of territorial development and state support for promotion of entrepreneurial activities in the regions (FZ#392 of December 3, 2011, *On Zones of Territorial Development in the Russian Federation and on Amendments to Some Legislation of the Russian Federation*). The law defines ***zone of territorial development*** as "...a part of the territory of an RF constituent, where residents are provided with state support measures to expedite socio-economic development of an RF constituent through establishment of favorable conditions for attracting investments to the economy."

In 2013, the RF Government approved the list of 20 constituents of the Russian Federation to establish zones of territorial development there. (Resolution #326 of the RF Government dated April 10, 2013, *On Approval of the List of RF Constituents where Territorial Development Zones May be Established*.) The list includes *Republics of* Adygeya, Altai, Buryatia, Dagestan, Ingushetia, Kabardino-Balkar, Kalmykia, Karachaevo-Cherkessia, Karelia, Northern Ossetia – Alania, Tyva, and Chechen; Zabaikalskiy,

Kamchatskiy, and Primorskiy *Krais*; Amur, Ivanovo, Kurgan, and Magadan *Oblasts*, and the Jewish *Autonomous Oblast*.

Regions from the list are expected to submit a request to the RF Government to establish a territorial development zone and furnish a long-term socioeconomic development strategy for the RF constituent based on the organization of the said zone. The law allows establishment of a zone in the territory of one or several municipalities, where it can stay as such for 12 years. The law provides for the following measures of government support: budget allocations from the RF Investment Fund for investment project implementation and infrastructure development (transport and power sector), to be owned by the state and needed for business undertakings by residents. Residents may also rent state and municipal land; they may get tax exemptions and investment tax credits up to 10 years. Sovereign guarantees are also possible to secure credits to the residents, as well as subsidies for the regional budgets for further support of residents.

An RF constituent may qualify for the inclusion into the list of areas for territorial zone development based on the following indicators demonstrated for the period of 10 years preceding the list approval:

1. Share of workers in business partnership and companies, where securities (shares) in the joint-stock (pooled) capital do not belong to the Russian Federation, RF constituents, and municipalities
2. The level of estimated budget sufficiency of the RF constituent
3. Average annual industrial production development indicators
4. Average annual agricultural production development indicators
5. A value to characterize a per capita income to subsistence level
6. Migration gain value
7. Mortality rate of working age people
8. Share of dilapidated and substandard housing in the total housing stock
9. Long-term unemployment rate (more than a year)

Thus, the Russian government regional development policy, aimed at equalization of socioeconomic development of regions and primarily at the provision of social guarantees to the Russian citizens regardless of their place of residence, is currently changing its focus in spatial development. Polarized development policy is seen as the most effective, being based on concentration of all types of resources at the poles of growth and subsequent propagation of innovations throughout the country. "Backbone" regions shall become the foundation of Russian spatial transformations. Thus, the Russian government regional development policy seeking further integration of the Russian Federation into the global economy shall facilitate the development of new types of territorial formations: (1) innovative areas, integrating innovative and education components, and (2) technology transfer areas (processing and outsourcing areas) based on the settlements with qualified workforce and high living standards.

Spatial planning improvement in the country shall seek achievement of the following objectives:

- Preservation of the country's territory as a unified political and economic space
- Provision of conditions for sustainable socioeconomic development of the Russian Federation through more efficient spatial distribution of production factors and transition from commodity to the high technology focus of the economy
- Support of further integration of the country in the global market
- Enhancement of transport and communication connectivity of the country, boosting mobility of human resources and stimulating socioeconomic development

The Russian Government developed an environmental policy for federal *okrug*s (mega-regions) and RF constituents based on the Ecological Doctrine and approved socioeconomic development strategies for mega-regions until 2020. The strategies include main areas of environmental policy for the next 10 years. However, most of the eco-positive benchmarks are purely declaratory.

Future environmental scenarios for Russia, as well as for any other country, depend on a number of various factors, including the country's natural conditions and extent and quality of socioeconomic development in the upcoming decades.

The first scenario is *inertial*. Under this scenario, the economy would continue moving on the same track where primary industries play a key role. Russian integration into global economy would fix commodity focus of the national economy under the scenario, preserving the tough environmental situation in the country in general. The world economy's demand for Russian natural resources would prioritize the national economy policy on the most profitable sectors, that is, commodity oriented. Unfortunately, this was the focus of the Russian economic policy developments in the early twenty-first century. The current political processes in Russia and elsewhere, however, may change the prospects.

Environmental impact of the natural resource orientation might be hardest for the monocompany towns where the workforce had no choice of another way of earning their income and may continue not to have that choice in the future either. Environment would suffer proportionally to the scope of industrial development. Partial equipment upgrades would alleviate the problem but not solve it for good. The government in this case may address some environmental problems at the cost of buyers of mineral resources, but it can hardly expect those buyers to be committed to the Russian environmental agenda.

The second scenario is *neoindustrial*. Emphasis on the growth of manufacturing sectors looks more preferable than on hydrocarbons. However, the experience of China, India, and "Asian Tigers" in accelerated industrialization on the basis of most advanced technologies and production on a mass scale do not result in a high environmental quality of life comparable to that of developed countries. The reason may be a low social demand for a better environment in the countries of new industrialization where a relatively cheap labor force is the main driver of economic growth. Industries in these countries are notorious for using all sorts of tricks to save on environmental costs.

Environmental consequences for the Russian development under the second scenario would be ambiguous. Low environmental component in the cost prices of ferrous and nonferrous metal production (on average they are tree times lower than the US cost prices in the same sector) boosts metallurgy in Russia, attracting a considerable portion of foreign investments, being a meaningful access opener to the international markets for the relevant Russian metallurgy. On the other hand, modernization of outdated industries may reduce the environmental footprint and ease tensions in the hardest hit regions.

The third scenario is *postindustrial*. Opinions differ regarding the postindustrial (innovative) development of the Russian economy, but skepticism prevails. However, the most developed countries provide a lot of evidence in favor of postindustrialization playing a rehabilitating role in the economy. As mentioned above, environmental situation has been improving steadily in most EU countries, in the United States, Japan, and other countries of postindustrial type. Thus, from the environmental point of view, the third scenario for Russia is the most preferable one, in theory.

# Territorial Management Controller

Laurent Lavigne
Université de Lorraine, Nancy, France

## Synonyms

Business partner; Cost analyst; Cost killer

## Definition

The territorial management control organizes and controls economic management of a local public service, defining the objectives, business

indicators, and performance measurement. It optimizes financial profitability and helps locally elected officials to define the overall strategy.

## Introduction

Taking up the concept of the role coming from sociology, management sciences used it to study the territorial management controller, as an actor. The description of the role of the management controller takes more particularly the concepts of the theory of the agency, by articulating two approaches: the contractualist approach positions the controller as a supervisor of the indicators of the performance, like a cost killer, and the conventionalist approach places the role of the controller on the dissemination of information, as a business partner. The territorial management controller works in local government, municipalities, and local public establishments. It is generally attached to the general management or the financial department. It belongs to the category of territorial employment managers or territorial engineers, recruited in general by external and internal competition with conditions of diploma and/or examination of integration in the typology of jobs according to the countries. It is led to supervise a small team usually made up of executives (Lavigne 2019). Desired studies, the required qualifications are multidisciplinary; the origin of higher education and training is strongly related to finance, in any business school with a specialization in "management control" and "finance" at the master level. The territorial management controller is apprehended across its tasks, its relationships, and its image. Profiles are revealed to date according to the size of the local public service and the skills of the local administration (Lavigne 2019).

## Tasks

The territorial management controller is characterized by conviction, group work, listening, and the sense of contact. It adapts and is influenced according to the internal culture of the organization. The management controller can determine the nature and form of the information. Its role is characterized by its link with decision support, apprehended on two levels: on the one hand informational. It brings a battery of numbers and offers a justification to decision-makers in their choices; on the other hand, it calls into question implicit reasoning, certainty, or hypothesis. It accompanies the possible and impossible of managers. It is a pilot of the activity by objectives and indicators, guaranteeing a finality of management in the community. It is the creator of interservice cohesion and a search for overall performance, refining the criteria "objectives, means, and results" (Dupuis 1991). The territorial management controller thus integrates the concept of performance into the managerial schema. It is not a producer of mass information but detects the right information to determine what is performing (Desiré-Luciani et al. 2013). In addition, it is a "man of study." In his role of adviser, of pilot, referee instrumentalization of the piloting. Important factors are variable, first seen in the relations between the management controller and its interlocutors and, secondly, in relation to the investment of it in the degree of the taking of decision. The assignment of new tasks progresses in the increase of their authority, on the one hand on the analysis of the information, the internal council, and the participation in the decision-making "strategic" (Lavigne 2019) and on the other hand on performance evaluation, design and implementation of new information systems, and process improvement. However, the management controller territorial sees some of its important tasks is to restrict, in the process budget, including activities related to accounting and finance, and reduced recurring tasks, such as reporting and consolidation (Lavigne 2019). The territorial management controller thus recovered from new features such as a more consistent involvement in the strategic decision-making with the increase of his authority and of the centrality of its service. It is present at the center of the organization and in the implementation of new information systems such as ERP which deport his role toward management informatics (Lavigne 2019). Across these new roles, the management controller is repositioned

toward the strategy of the territorial organization. The role of the territorial management controller is to drive a culture of results, to control costs, to measure the quality of the public service, and to bring about a modernization of governance. Thus, to achieve its objectives, it focuses on analyzing the realized and perceived quality of a public service, effectiveness and relevance to citizens, the impact of actions, the monitoring action, and the social climate (Konrad 2018). It seeks to involve stakeholders in day-to-day management situations through the development of dashboards, the relevance of indicators, the instrumentation of performance, and the interpretation and dissemination of tools. Finally, the missions of the territorial management controller are to "prevent, measure, and act." His role, in the performance of its tasks, is to refine the dashboards so that they are contingent. Its usefulness only makes sense when it is crafted and used to finalize, animate, and control the performance of the organization (Gibert 2009).

## Relationships

The territorial management controller has a relational role (Bollecker 2007). It is thus in an unstable relationship within the framework of "knowledge/power" although it has knowledge that allows him to decide. The management controller is not neutral in the decision (Bollecker 2007). It uses a certain power to override the decision aid. It appropriates the decision-making power in place of operational managers or head managers. In the same way, his position can grant him a power of predominance in the change and the training of the agents. In fact, the management controller has a relation role of incentive, preparation for the future, and a role of a trainer (Godener et al. 2002). It does not stop with a simple desire to influence, but seeks an important position in the organization, employing strategies of actors (Bollecker 2007). Following on from these relational characteristics born the pedagogue managerial role individually and collectively. In an individual attitude, in other words, alone in its service, it is in close contact with the board in order to provoke in the operational and the manager "critical attitudes and challenged continuously, for example, in personnel management, or even stocks and investments." Collectively, the management controller pedagogue promotes teamwork in animation, "think tank," and management dialogue. The role of the controller is not to play a counter-power, but to serve the organization. Thus, depending on his hierarchical position, he integrates dominant/dominated strategies. It changes and adapts to allow a reorientation of the objectives of the organization. It uses its margins of freedom, to gain importance in the organization, through management tools by offering solutions to managers (Godener et al. 2002). The territorial management controller clarifies management's expectations. It gives the necessary advice by justifying his interventions: it is his organizational legitimacy (Desiré-Luciani et al. 2013). It is a man *under pressure*, and this pressure comes from the goals of the rudest directions (Desiré-Luciani et al. 2013). It makes a convincing explanation of the stakes of the organization and makes the operatives adhere to the objectives. It detects the problems and clarifies these same objectives. The relational positioning of the territorial management control is the responsibility of the general management. It depends on the weight of the organization (Desiré-Luciani et al. 2013). In order to consolidate the relational environment on territorial governance, the management controller designs the management dialogue. This dialogue thus refines information quality. Therefore, its approach is to exploit the objectives of the organization by representing an economic model. This economic model makes it possible to develop a mapping of the costs generated by local public services (Lavigne 2019).

## Image

The management controller is also defined in its image. The knowledge of the field is essential in the reliability of the dashboards (Desiré-Luciani et al. 2013). It is conceivable that the image of

the controller is trusted by his knowledge of the field. The image of the management controller is thus built on considering its action (Desiré-Luciani et al. 2013). It is perceived sometimes and perhaps rarely as a partner, a transparent man (Desiré-Luciani et al. 2013). More precisely, in this vision, the management controller becomes an organizational partner "business partner," a real support for central managers (Lavigne 2019). The justification of the image of a "business partner" is favored by the accompaniment of a quality information. The "business partner" profile directs the management controller toward decision support and assistance to operational staff, thus abandoning the bureaucratic tasks managed by the ERP (Lavigne 2019). It does not duplicate the operational staff in their activities but assists and advises them in the implementation of these activities (Bollecker 2007). The management controller has an image gatherer of profits in an optical optimization, secondly to show the expected or actual performance. It is therefore also an image of reciprocity (Bollecker 2007). In this vision, it embodies flexibility and solidarity especially in the difficulties encountered in the organization. It avoids using his power and seeks more conciliation through communication, although it can concentrate a significant amount of influence on decision-making because of his position as informational sponsor (Bollecker 2007). It can also acquire a conciliator image. The use of communication and not hierarchical power relations favors the maintenance of this positive image (Godener et al. 2002). In a more wait-and-see attitude, an image of "dirty work" (Morales and Lambert 2013) can be attached to it because the image it refers to is often altered in the organization by a bad understanding of sanctions that attract mistrust and distrust (Desiré-Luciani et al. 2013) and ultimately cost reduction. It has an image of "attenuator" plausible integration difficulties of this change. Nevertheless, his reported image is strongly influenced by his behavior in the improvement of communication and the increase of the motivations; it is more an incentive to the managers (Konrad 2018).

## Types of Territorial Management Controllers

Territorial management controller has a double face. It is at the same time a decision-making aid, therefore a "Business Partner"; and a major player in profitability, so in the first place focused on cost reduction ("cost killer"). This is broken down into four recently updated profiles (Lavigne 2019).

### The Territorial Management Controller Analyst

The management controller analyst is favored in the case of the recent establishment of a management control service. Its role is focused on financial reporting responsibilities. The analyst is primarily focused on cost analysis missions. This profile provides clarifications to senior management. It is heavily involved in the "audit mandate" but also to a lesser extent in "decision support" (Hopper 1980). It usually works in organizations local little worn on the evaluation of performance. The clients of this controller are mainly the financial and, to a lesser extent, senior management. The analyst is in a summary space to a single individual in financial services. The territorial analyst controller is more concerned with cost reduction ("cost killer") and monitoring (Lavigne 2019).

### The Territorial Management Controller Partner

It is a profile focused on explanatory approaches to the need of management control. The peculiarities of this type of management controller are based on a relational dominance, focused on partnership, and a support of services in management methods. It is an asset for decision support for operational staff (Lavigne 2019). It can influence strategic decisions but only acts as an advisor. The attitude of this controller is strongly involved in decision-making at the unit level. It focuses on the "audit mandate" for senior management (Hopper 1980) as well as for operational managers. It intervenes in decision support for the elected officials. This profile is advocated in a

commitment to ensure management control within the organization and provide operational support to the elected officials. It is also a controller present in cases where the local public structure is weakly constituted in terms of satellites (Lavigne 2019).

### The Territorial Management Controller Advisor

It's a management controller right next to head management with activities carried on a research performance. However, it has a mixed relationship with the elected officials. His role at the political level is not appreciated. On the other hand, his intervention in decision support brings little conflict. It plays an important role at the financial level. It would be closer to the General Directorate of Services, the advisor, and the flight attendant than to the facilitator (Lavigne 2019). It is often of diminished importance because it is presented as a cell with more diverse and less decision-making tasks. However, it has a strong involvement in the audit mandate and to a lesser extent in decision support. This controller is surrounded by a sharing of responsibilities by different operational agents, between internal control and decision support. It has little power over the general direction, whose advice is sought. It is also an expert in external control (Lavigne 2019). Moreover, it is a profile sought in the case where a local public service would have few technical services to manage. It is not worn on a substantial operating budget. However, it is sought for its competence in the management of small and important satellites; the controller of management would be more a partner ("business partner") and to a lesser extent positioned on the reduction of the costs ("cost killer") (Lavigne 2019).

### The Territorial Management Controller Strategist

The fourth profile is focused on the strategy and the evaluation of public policies. It has a strong involvement in the evaluation and optimization process. It is a management controller specializing in the analysis of costs and in the measurement of territorial activity. It is a correlation between management control and the search for performance, as well as an appreciation of its intervention both financially and organizationally (Lavigne 2019). The strategic management controller has extensive assignments in strategic projects, in the management dialogue, and as an organizational partner; Management controller contributes to the search for profitability of services allowing the realization of studies of aid to the strategic decision. This management controller profile is included in a "management control" function close to the general management. Organizational positioning favors an evaluation of public policies of elected officials and an assessment of analysis at the political level. His role as an expert emerges more in time. It participates in decision-making and animates it. The service itself is very powerful. More service, the greater the role of the management controller is legitimized in specialized areas, such as in reporting financial and internal control which are considered essential and under his responsibility. It is strongly involved in the "audit mandate" as well as in "decision support" (Hopper 1980). In addition, it focuses on large organizations with high technological potential. The strategic profile is a management controller that can be described as "centralized" or "headquarters." The strategist controller in the local public services is in a fair bipolarity between the partner ("business partner") and on cost reduction ("cost killer").

## Conclusion

The territorial management controller appears contingent on organizational factors such as the height of head management and local government specifications. On the whole, and regardless of its profile, the territorial management controller, regardless of the local administration of the country in which it works, provides decision support, it is an organizational partner (Lavigne 2019). It also contributes to the rationalization of means and aims at a local

performance, even if it describes themselves as partners. Embodying this function, the management controller contributes in this approach to performance management. It provides decision support based on the measurement of the activity of public goods and services combined with the analysis of their costs. In addition, the evaluation of public policies is the new standard of performance in local public services. It is presented as the guarantee of the good management and the good image of the organization. The territorial management controller is the main support of the head management, in the evaluation of public policies.

Development economics; Economic development; Economic growth; Human development; Social progress

## Definition

*Development* is a process of disproportionate growth of systems. In economics, development is a multidimensional process that generates economic, technological, social and institutional change to support wealth of nations and a comprehensive wellbeing of people in society.

## Introduction

Economic development is a process that generates economic, social and technical progress of nations. The fundamental elements of development in society are: the improvement of health, the growth of wealth, the creation of new knowledge and technology, etc. Economic development is fostered in appropriate social systems with high democracy and culture, good economic governance, efficient higher education system, and high innovative outputs (Coccia 2010, 2014, 2014b, 2018a). Economic development can be explained with different theories that are discussed in next sections (Fig. 1).

## Theories of Development in Economics

The study of economic development is one of the most important research fields in economics,

**Theories of Development, Fig. 1** Theories of Development in Economics

political economy, and other social sciences (Nafziger 2005). The schools of classical and neoclassical economics analyze the development in terms of the efficient allocation of scarce productive resources to support optimal growth, produce and expand the range of goods and services. Instead, new economic approaches explain the development with socioeconomic, political, and institutional factors that accelerate economic growth, improve the levels of living, and reduce poverty of population, income inequality between people, and violent crime in society (cf., Todaro and Smith 2003; Coccia 2017). A traditional economic measure of development is given by gross domestic product (GDP): the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. Contemporary studies and theories have added noneconomic indicators for measuring development in society, such as Human Development Index (HDI):

> a summary measure of average achievement in key dimensions of human development: a long and healthy life, being knowledgeable and have a decent standard of living. . . The health dimension is assessed by life expectancy at birth, the education dimension is measured by mean of years of schooling for adults aged 25 years and more and expected years of schooling for children of school entering

age. The standard of living dimension is measured by gross national income per capita (Human Development Reports 2018).

In this context, theories of development can be divided in two macro categories (cf., Fig. 1):

- Theories of development of national systems
- Theories of regional development

## Theories of Development of National Systems

### Classical Theories of Economic Development

- Linear stages theories are: Rostow's stages of growth and the Harrod-Domar growth model (cf., Todaro and Smith 2003). The theory of stage of growth suggests that more saving and investment can accelerate the rates of economic growth. However, the theory of stages does not clarify the economic development of poor nations, because suggested drivers (e.g., physical capital) are necessary but not sufficient factors for supporting economic growth. In fact, high investments of physical capital in many developing nations have not generated historical paths of economic development because of lack of other socioeconomic factors, such as, an efficient higher education system and good economic governance. European countries after World War II, by contrast, increased physical capital in a context with good institutions and high-skilled human resources, generating long-run economic growth.
- Structural change models. This approach focuses on mechanisms that transform economic structure of nations from traditional agriculture to industrial and service system. In particular, structural change approach is based on theories of neoclassical price and resource allocation. Two main approaches are: the model of two-sector surplus labor by Lewis (1954) and econometric analysis of the patterns of development by Chenery and colleagues (1975). The model of Lewis (1954) considers a process of modern sector self-sustaining growth and employment expansion that are assumed to continue until all surplus of rural labor is absorbed in new industrial sectors of urban areas. However, a limitation of the model by Lewis (1954) is the assumption of diminishing returns in industrial sector, whereas empirical evidence shows increasing returns in that sector (Todaro and Smith 2003).

  Empirical patterns of development consider the steady accumulation of physical and human capital, the change in consumer demand from food and basic necessities to manufactured goods and services, the growth of cities and firms associated with migration of people from farms and small towns to large cities, decline of family size and of overall rate of growth of population. However, economic policies based on this approach have not, in many cases, generated pathways of development within and between countries.
- The international-dependence models consider developing countries in a relationship of dependence with developed countries. Major approaches are: neocolonial-dependence, false-paradigm, and dualistic models. These approaches reject neoclassical theory of development designed to accelerate growth of gross national product; they also reject the empirical results by Chenery about some characteristics of development that poor countries should pursue (cf., Todaro and Smith 2003). These international-dependence models stress the imbalance of socioeconomic power between rich and poor nations. According to the American sociologist Immanuel Maurice Wallerstein, the world system has core and periphery regions, in which powerful and wealthy core societies dominate and exploit weak and poor peripheral societies. In particular, the strong nations reinforce and increase the flow of surplus because their governments provide economic assistance to capitalist classes on world market. The major weakness of this approach is the actual experience of Least Developed Countries (LCDs) that have had nationalization of firms and state-run production with negative effects on long-run patterns of economic growth.
- Neoclassical counterrevolution considers underdevelopment of LCDs as internally induced phenomena caused by government

intervention and bad economic policies. Neoclassical counterrevolution's approach suggests that market price and resource allocation usually produces better results than state intervention. Moreover, the liberalization of national markets generates additional domestic and foreign investments that increase the rate of capital accumulation. In this context, the neoclassical growth model by Solow (1956) expanded the Harrod-Domar model, adding to growth equation a second factor, labor, and inserting a third independent variable, technology. Solow's model shows diminishing returns to labor and capital separately and constant returns to both factors jointly. In this theoretical framework, technological progress is the residual factor that explains long-run economic growth (cf., Coccia 2011, 2018a, 2018b). The output growth is due to increases in labor quantity and quality (population growth and education), increases in capital (through saving and investment), and improvements in technology. Closed economies grow more slowly, whereas open economies have an income convergence at higher levels because capital flows from rich countries to poor countries where capital-labor ratios are lower and returns on investments are higher. However, free markets and open economies may also increase income inequality, violence, and public debts that may reduce the well-being of people in the long run (Coccia 2017, 2017a).

Contemporary Models of Development (cf., Todaro and Smith 2003)

- Endogenous growth theory argues that the growth of Gross Domestic Product (GDP) is determined by production processes within economic system, rather than by forces outside that system. This theoretical framework has been developed by Kenneth Arrow in 1962, Hirofumi Uzawa in 1965, Paul Romer in 1986, Robert Lucas in 1988, and Sergio Rebelo in 1991. Subsequently, Paul Romer in 1987, Philip Aghion and Peter Howitt in 1992, and Gene M. Grossman and Elhanan Helpman in 1991 incorporated imperfect markets and Research and Development (R&D) to endogenous growth model. This new growth theory endeavors to explain different growth rates across countries and factors associated with the rate of growth of GDP that are left unexplained and exogenously determined in the Solow neoclassical model of growth (i.e., residual factor; cf., Solow, 1956). In general, investments in human capital generate external economies and productivity improvements that offset to explain the existence of increasing returns to scale. Endogenous growth models also explain anomalous international flows of capital that generate wealth inequalities between rich and poor nations. However, economic literature shows that high rates of return on investment within developing economies (with low capital-labor ratios) are eroded by low levels of investments in education, infrastructure, and R&D (cf., Coccia 2011, 2018b). Especially, new growth theory depends on neoclassical premises that are inappropriate for LCDs. Finally, empirical studies provide a limited support to the predictions of endogenous growth theory (Todaro and Smith 2003).
- New theory of economic development stresses complementarities between several factors necessary for successful development of nations. Investments have to be done by many agents to produce results for any individual agent. When complementarities are present, an action taken by one firm, worker, organization, or government, it increases the incentives for other agents to take similar actions. In particular, complementarities involve investments whose returns depend on investments done by other agents. In this context, the model of Big Push suggests that production decisions by modern-sector firms are mutually reinforcing (cf., Todaro and Smith 2003). Another model in this theoretical framework is the Kremer's O-ring model (1993). This approach focuses on a production function with many tasks, which must be proficiency all completed to have a full value of product. Mistakes during the process of production can be extremely costly, reducing the product's value (the name O-ring comes

from the accident of the space shuttle Challenger that exploded because one of the components, the O-rings, failed). Underdevelopment of countries can be also due to a coordination failure: agents have inability to coordinate their behavior (choices), generating frictional factors for patterns of economic growth.

### Theories of Regional Development

Geoeconomic space with regional disparities can generate poverty, unemployment, social issues, income inequality, violent crime, etc. (Coccia 2009, 2017). The goal of the theory of regional development is to reduce regional disparities within a country to support a general development of nation as a whole system. In this context, development was defined by Perroux (1955, p. 308) as "a selective, cumulative process which does not appear everywhere at the same time but becomes manifest at certain points in space with variable intensity." Perroux (1955, p. 309) also argues that the growth does not appear everywhere at the same time and with the same intensity; it appears at specific spatial points or poles of growth with varying intensity of socioeconomic interaction; after that, it these poles spread economic activities along various channels, generating different effects on growth of regional and national economic systems. Growth pole theory was proposed for solving inequalities in economic growth of regions within nation. A critical factor of this approach is the concept of growth pole: a large cluster of firms and/or industries strongly related through input-output linkages to a leading industry (or propulsive) firm and/or industry. Propulsive industry and interrelated industries innovate and grow faster than other industries external to the pole, generating economic development in specific areas by their capacity to stimulate different forces within socioeconomic system.

The concept of growth pole was subsequently developed by Jacques Raoul Boudeville considering a set of expanding industries located in an urban area that induces the development of economic activitis throughout zones of influence. The essence of growth pole analysis is that spatial concentration of economic activities and agglomeration of population are the most efficient factors to support economic growth of regional systems.

Although agglomeration of industries is a key element in spatial organizational efficiency, of course, it is not the sole force supporting regional growth (Coccia 2009). Other factors, supporting economic growth associated with propulsive industry, are an efficient higher education system, low corruption and criminality, good economic governance, high innovative outputs and new technology in democratic contexts, etc. (cf., Coccia 2010, 2014, 2015a, 2015b, 2018a, 2018c, 2018d, 2019). Moreover, the growth pole has to be created in spatial areas with at least 250,000 people before the above mechanisms work within geoeconomic space for supporting regional growth. From the viewpoint of policymakers, the major advantage of these approaches is the opportunity for integrating industrial policy, physical planning, and inter-regional and intra-regional economic planning.

## Sustainable Development and Conclusions

The global and industrial society, driven by new technology, is generating economic growth rather than a sustainable development of nations (Coccia 2015). Scholars assert that one of the main effects of development on environment is pollution, which started with the Industrial Revolution in Europe and North America, driven by technical and economic change of steam engine, internal combustion engine, and other new technology (Coccia 2015). In general, economic development of the last decades is causing demographic, environmental, and climate change. In particular, European, North American, and Chinese development is generating socioeconomic progress and well-being of people but also the diffusion of some mutagens and genotoxic carcinogens from industrialization processes (e.g., pollutants, pesticides in agriculture, several chemicals, asbestos, processed or chemically preserved food, etc.; Coccia 2015). Hence, development of nations generates economic growth but also a general

pollution that has negative consequences on environment, health (e.g., cancers), and food safety in society (cf., Coccia 2015, p. 62; Coccia 2013, 2014a, 2016).
